The Week.

The sales in San Francisco Stock and Exchange Board for the week ending August 13th, aggregated $5,500,000. During the last week they have been reduced to $3,880,000. The falling off has been brought about by the persistence of indefinite, and the entire want of unmistakable reports from the mines. Our people are growing too practical to live for more than a week on air. The Julia has made arrangements for connection with the Sutro tunnel. This is the first of an inevitable series of movements important to the Comstock.

The news from Mono county is good. At least six new companies, intending to work in that region, have lately filed articles of incorporation. One of these is that formed from the old Bodie company. An entirely new company was organized; the stock of the old organization was not watered as seems to have been hinted.

Arizona is now demanding attention. Since the new mill started up in June, the Silver King has been shipping concentrated ore crushings of constantly increasing richness; $2,000 per ton, then $3,000, then $4,000, and nuggets yielding nearly $18,000 pure silver per ton, have been the reports. Exceedingly rich discoveries of gold about 44° 30′ north latitude, and 110° 30′ west longitude are rumored. The happy location is near the boundary between Wyoming and Montana, on the north fork of the Stinking Water, about 250 miles from Fort Custer. These are the directions. If anyone wants to "stampede," let him do it. As far as we are concerned, California is still rich enough, notwithstanding the meager mining exhibit at the Mechanics' Fair. Charity and true success begin at home.

Chrome Iron.

Chrome iron is found in large quantities in many places in California. There are deposits of it near Crescent City, Del Norte county, near Folsom in Sacramento county, and in Sonoma county. Within the last fortnight we have received specimens of fair ore from Nevada county in the vicinity of Grass Valley. The press of San Luis Obispo county is endeavoring at present to bring before the public the fact that that neighborhood, too, boasts chrome iron among its resources.

As to the quantity of the ore there can be no doubt. There, is, however, a question as to its quality. The general statement of shippers in San Francisco is that the ore is very poor, so poor that it can be sent to the East only when the very lowest freights obtain. The ore is used for making the chromates of potash, and its value depends upon its richness in chromic oxide. Chemically the typical chromite or chrome iron ore is a compound of one equivalent of ferrous oxide and one of chromic oxide. This would give the amount of chromic oxide in a perfectly pure specimen at over 67%. Such a specimen of course never occurs in nature. The ore invariably contains impurities of alumina, magnesia, silica, etc.

Naumann quotes Bechi and Von Hauer. The former gives the following percentages of ingredients found in a specimen from Volterra, in Tuscany: Chromic oxide, 44.23; alumina, 20.83; ferrous oxide, 35.62. Von Hauer gives the following percentages obtained from a specimen from Eibenthal: Chromic oxide, 49 to 52; alumina, 10 to 12; ferrous oxide, 18 to 21; magnesia, 11 to 15; silica, 4 to 6. Ure quotes Klaproth and Vanquelin. The former gives the following percentages: Chromic oxide, 43; ferrous oxide, 34.7; alumina, 20.3; silica, 2. Vanquelin gives as above, respectively, 55.5, 33, 6, and 2. A specimen from San Domingo gives 36% of chromic oxide; from Norway, 54%; from Baltimore, 39.5 %; crystallized, from Baltimore, 60%.

In these we see the amount of chromic oxide varrying from 36% to 60%. For California ore we have only the data of one analysis, that of a sample from Sonoma county. It gave 43% oxide of chromium. It is not at all unlikely that this was a picked sample, and gave, consequently, a high result. If those who own mines of this ore wish to obtain anything like correct analyses on which to base practical estimates, they must send *average* specimens to the assayers. In considering the practicability of working the ore on this coast, the first thing to be determined is the quality of the ore; and the sooner a good number of careful analyses are made, the better.

Whatever the quality of the ore may be, it must have occurred to every one interested, that if it pays to ship it to Baltimore and even to England, it would certainly pay to work it here. As far as the materials necessary for working the ore are concerned, we are not aware that our coast presents any peculiar difficulties. It is said that Baltimore has a secret process, which is the only one that can "get money out" of the ore. But this remains to be proved. At any rate, investigations made four years ago with regard to the cost of production on this coast of bicromate of potassium, as compared to the demand for it, gave the following results: Dr. A. Blatchly, of San Francisco, made the following estimate, based, we believe, upon 43% ore from Sonoma. Considering the cost of mining and transporting to the factory, and also of the necessary chemicals, labor and incidentals, he made out that 7,500 pounds per day of the bichromate might be obtained from five tons of the concentrated ore and delivered from the factory for $743. The annual home consumption for the coast mills, for miscellaneous dyes, for the chromic paints and for other purposes, was estimated at 192,000 pounds, which at the then New York price, 18 cents, would bring $34,560. Estimating the average expense of delivering 7,500 pounds at any market at $20, probably very much too large, we would find, on the basis of the above cost of production, that 192,000 pounds might be delivered on our coast for $19,532, showing, at the above price, an immense profit. The factory necessary to manufacture 7,500 pounds of the bichromate per day would require an outlay of about $9,000. So a mill of this capacity, supplying this coast alone, would lie idle 11 months out of the 12, and yet more than pay for itself in the first year.

But there is now the Eastern demand to be considered. During the first six months of 1874, there were shipped from San Francisco, 1,013 tons of chrome iron. One firm in San Francisco say they ship yearly between 1,500 and 2,000 tons. The greatest demand is at Baltimore. Calling it 1,500 tons and considering that five tons will produce 7,500 tons of the bichromate, also that this is all demanded for consumption east of us, we find that there would be a market away from our coast for at least 2,250,000 pounds of the bichromate, which would cost us to manufacture, $222,900, and to send to New York, about $30,000 more; that is a total cost of $252,900, and which would bring, at the above rates, $405,000. This would keep the mill busy throughout the year.

These estimates do not pretend to be accurate, but they are near enough so as to show what a means of profit our coast has at its hand, but does not seize. If the mine owners send yearly 2,000 tons of the crude ore from this coast, they obtain for it from the shippers about $14 a ton, giving to them about $28,000, from which they must deduct the cost of extracting the ore from the mine. What is wanted is more enterprise and a willingness to risk a few thousand dollars on the prospect of receiving many thousands in return. A little experimenting must be done at first, and the mine owners will find that they and their friends are the best ones to do it, and that the best place is right at the sites of the ore deposits.

The San Luis Obispo deposits are particularly favored in being near the new Black Star coal mines, in Los Angeles county. It has been stated that coal will at some time in the near future be delivered in Los Angeles at $4.50 per ton. This may have some influence in developing the chrome resources of San Luis Obispo. There is no reason at all why the chrome should be sent from that county in any other shape than as bichromate, ready for market.

Silver-Plated Amalgamating Plates.

We saw this week at the San Francisco Plating Works, 653 and 655 Mission street, a single sheet of metal, of 25 square feet surface, which had been heavily silver plated. This is probably the largest piece of metal ever plated, and will be exhibited at the Mechanics' Fair by Mr. Denniston, proprietor of the works. It is ultimately to be used as an amalgamating plate in placer mining work. Single sheets of metal of this size can only be made at few places, since the necessary facilities for this class of work are not common. At these works is a tank which will hold 1,000 gallons, in which these large plates are treated.

We also saw 26 metal sheets, each with 12½ square feet of surface, which are to be used for placer-mining plates at Bonanza Bar, off Kelton. Some other plates are being made to send to quartz mills in Utah and California.

It is found that after the copper plates are silver plated, they answer much better for amalgamating plates for mill work, not oxidizing and being more easy to keep clean; so that Mr. Denniston has built up quite a trade in amalgamating plates of this kind. He has extensive facilities for doing this work, and has supplied over 200 quartz mills since he first began to manufacture the silver-plated amalgamating plates. His present facilities admit of his doing this work at reduced rates, so that he is constantly filling orders for mills and placer mines, and getting fresh orders from new people, showing that the plates, prepared in the manner stated, are appreciated by miners.

In addition to these plates, gold, silver and nickel plating in all its branches is carried on. Just at present a large order of plumbing work is being finished. The faucets, etc., comprised in these articles are the finest that ever came to this coast, and were ordered through McNally & Hawkins, for an elegant residence in this city. All the material is to be heavily plated with gold and silver. Mr. Denniston just sent away by last steamer a large order of hotel goods to Japan, which were sent to him for replating. He has also done considerable copper plating of late for the new City Hall. The works are kept quite busy on all kinds and classes of jobs, plating new articles or replating old ones. Considerable work is done for hotels, restaurants and other large establishments.

The great exhibition by the Mechanic's Institute is now under full progress at the Pavilion in this city. The various departments of art and industry have contributed their quotas, and the display of varied articles wins high praise from visitors. Almost every one will find something in the acres of exhibit, which will win his interest or her admiration. The fair is well planned for those of vigorous appetite, who joy to make an optical meal of ingenious and ponderous machinery, natural productions and curiosities, or the gems of merchandise and manufacturing. There is also abundant fahulum for the daintier appetites which are tickled by full draughts of instrumental music, the art of the picture gallery or the improved nature of the garden. In short, the Fair seems well furnished at all points. Even the department of polite literature is not forgotten, as the bright *Fair Daily*, published by Dewey & Co., and edited by the hrilliant and versatile literary Carpenter from Ukiah, will testify.

Artesian Well Boring.—Will parties having experience furnish us some facts concerning the cost of boring artesian wells in different parts of the State. As no manufacturer of artesian well boring apparatus in this State advertises that business, we hereby offer to publish free, for the benefit of our readers, the address of all such manufacturers, if they will state the cost of instruments of the sizes used. The more that is known about the artesian well business, the better for our readers at large, we believe.

We understand that Irwin Davis has purchased the Vulture mine, near Wickenburg, Arizona, for $202,500, and that his agent is now in possession.

One clean-up at the Frazer claim by the ocean beach gives the men five dollars per day.

WHAT AND HOW?

In this column are printed all sensible inquiries relating to subjects connected with mining or relating to any matters of general scientific interest; also the answers to them as dictated by individual experience, or as furnished by correspondents.

Grass Valley Ore.

Editors Press:—I take the liberty to send a few specimens of iron ore from Grass Valley district, Nevada county. I send them by Wells, Fargo & Co. They are numbered 1, 2, 3, and 4. No. 1 is a specimen of chrome iron ore; No. 2 is also chrome iron ore; No. 3 is a specimen of iron ore from a ledge about 15 feet thick, with plenty of limestone close by it. No. 4 is from another vein of ore not more than 18 inches thick. If you think the specimens worthy of exhibition at the Mechanics' Fair, you will please see that they are exhibited.

If there is any market value for chrome iron ore in San Francisco or any other place that you may know of, you will be doing me a favor by letting me know both the market and price per ton.—M. C. Taylor, Grass Valley, Cal.

Your specimens have been shown to J. S. Phillips, the metallurgist. He pronounces the chrome ore as fair. The other is probably a mixture of magnetite and chrome ore. The magnetite will find no market now. Good chrome ore is worth about $14 per ton in San Francisco. It is shipped from here to Baltimore and England.

Your specimens will be exhibited in the *Journal of Commerce* collection at the fair. After the fair we shall keep them until we hear from you.

Progress of the State.

We shall be able, during the exhibition, to judge and estimate, from the panoramic views of the useful arts, what the progress of the State has been during the past year. We can see the sources of our honest and reasonable pride in her progress more clearly than in any other way. Almost every branch of industry is carried on in this city, and many of their houses are being established throughout the State, here, there and everywhere. Our community, to be progressive, must be independent and have resources within itself, so that it must produce and manufacture. This we have not been doing very long, as compared with older countries, but still we have made very rapid strides, considering our location and surroundings.

There is no way of knowing what progress we make unless we occasionally gather under one roof all the various products on which we are at work from day to day, and place them side by side for public inspection. This way our citizens judge of one another's work and see where their own products may be improved or benefited. Each, in his own sphere, will contribute his mite of progressive thought and action for the common good. The public, for whom all these things are created, will compare the different fabrics, products and mechanisms, and determine which suits them best. Then those who fall under the mark must spur themselves on to superior excellence and renewed energy, changing, improving, or bettering in one way or another, the peculiar work.

Thus it is that these exhibitions result in a common benefit to all, and directly in a benefit to the State, in which we are all interested. Men who work in the same groove from day to day, without seeing what others are doing, are too slow for this progressive age, and become stragglers in the march of progress. They need stimulation, and nothing will stimulate them so much as to see others excel them in their own location. We all know that people will patronize superior workmen, and buy the best made, and when a dozen or more compete with articles of a similar nature, each must make the best show he can to attract the attention of the consumer, on whom he depends for profit. A man can see the deficiencies of his own work when it is placed beside that of a superior workman, and this is the very best incentive he can possibly have for improvement. He will not sit tamely down and let a rival excel him without renewed effort to improve his own products; nor will he fail to observe the excellencies of better work than his own.

Mining Agency.—Messrs. W. H. Howland and W. A. Lauson have established au agency in this city for the purchase and sale of mines, machinery and supplies. Mr. Howland is an old miner, well known on the coast, and was formerly connected with the Miners' Foundry. Persons having mines to sell or desiring to buy, can address the firm as per card in our advertising columns.

The Elephant ore stamp, recently described in the Press, is to be practically tested at Tuttletown, Tuolumne county, by Judge Dorsey, owner of a mine there.

Austin, Nevada, was devastated by a cloudburst August 15th. Loss will approximate $100,000.

What Natural Slickens Will Do.

It has been hinted very strongly if not directly stated in the testimony at the great mining debris trial, that the miners are doing only what Mother Nature herself would do in a somewhat longer time if left to herself. In pursuit of that idea, it has been interesting to look over what Le Conte and Dana say about the erosive power and the deposits of rivers.

To a system of combined erosion and deposit is due in great measure the winding courses of rivers. This cannot be more concisely and clearly put than as it is found in Le Conte's new work on geology. From this book our figure is taken. This production of the winding course is, he says, "most conspicuous and most easily studied in rivers which run through extensive alluvial deposits. If the channel of such a river be made perfectly straight by artificial means, very soon some portion of the bank a little softer than the rest will be excavated; this will reflect the current obliquely across to the other side, which will become similarly excavated. Thus the current is reflected from side to side, increasing the excavations. In the meantime, while erosion is progressing on the outer side of the curves, because the current is swiftest there, deposit is taking place on the inner side, because there the current is slowest; thus, while the outer curve extends by erosion, the inner curve extends, *pari passu*, by deposit (Fig. 1), and the winding continues to increase, until, under favorable circumstances, contiguous curves on the same side run into each other, as at *a b*, and the curve *c* on the other side is thrown out and sifted up. Thus are formed the crescentic lakes or lagoons, *u*, so common in the swamps of great rivers. They are abundant in the swamps of all the Gulf rivers, especially the Mississippi. They are old beds of the river, thrown out and silted up," as above.

Of flood-plain deposits, more interesting in the present case, he says: "All great rivers annually flood portions of level land near their mouths, and cover them with sedimentary deposits. The whole area thus flooded is called the flood-plain. These flood-plains are very extensive, and the deposits very large, in the case of rivers rising in lofty mountains and flowing in the lower portion of their course through extensive tracts of flat country. In the lofty mountains the current runs with great velocity, and gathers abundant sediment; on reaching the flat country the velocity is checked, the river overflows, and the sediment is deposited. The flood-plain of the Mississippi river is 30,000 square miles. The flood-plain of the Nile is the whole land of Egypt. The flood-plain of a river may be divided into two parts, viz: the river swamp and the delta. The river swamp is that part which was originally land surface; the delta that part which has been reclaimed from the sea or lake by the river.

"We have already seen that with every recurrence of the rainy season or the melting of snows the flooding and the deposition of sediment are repeated. Thus the river-swamp deposit increases in thickness, and the level of the whole flood-plain rises continuously. Fig. 2 is an ideal section, showing the manner in which the flood-plain is successively built up; *a a a* is the supposed original configuration of the surface, *b b* the successive levels of deposits, *e* the level of the river at lower water, and *i i* the level of flood water.

The extent of such river-swamp deposits is sometimes very great. The river swamp of the Nile constitutes the whole fertile land of Egypt above the delta. The river swamp of the Mississippi river, or its flood-plain, exclusive of the delta, etc., tends from 50 miles above the mouth of the Ohio to the head of the delta, a distance of about 700 miles; its width is 10 to 15 miles, and it includes an area of 16,000 square miles. It is bounded on either side by high bluffs belonging to a previous geological period. The depth of this deposit at the head of the delta is assumed by Zyell to be 264 feet. But Prof. Hilgard has shown that but a small portion of this is actually river deposit."

In Dana we find it stated, on the authority of the Delta Survey, that the amount of silt carried down by the Mississippi to the Gulf of Mexico is about 1-1500 of the weight, and 1-2900 of the volume of the water, which would equal in one year 812,500,000,000 pounds, or a mass one square mile in area and 241 feet deep. At different times the following data have been obtained: Sediment carried by the Rhone at Lyons, 1-17000; at Arles, 1-2000; in the delta, 1-2500; in the Ganges river, 1-510. According to Allardt, in the mining debris trial, the amount of sediment in the Bear river varies from 1-67 to 1-17 of the weight of the water. If, as Ashburner said, these estimates are five times too great, they should be altered to 1-335 and 1-85. The condition of rivers are, however, so different that any comparison of such figures forms in itself an argument.

To return to Dr. Le Conte. "It is seen by the cross section (Fig. 2) that the level of the river-swamp slopes gently from the river outward, so that the river is bounded on each side by a higher ridge, *d d*. The material of this ridge is coarser than that of the swamp further back. Such natural levees are found along all rivers subject to regular overflows. They are formed as follows: In the times of flood the whole flood-plain is covered with water moving slowly seaward. Through the midst of this wide expanse of water runs the rapid current of the river. Now, on either side, just where the rapid current of the river comes in contact with the comparatively still water of the flood-plain, and is checked by it, a line of abundant sediment is determined, which forms the natural levee. Except in very high freshets these natural ridges are not entirely covered, so that the river in ordinary floods is often divided into three streams, viz: the river proper and the river-swamp water on either side. They cannot, however, confine the river within its bank and prevent overflows, since the river bed is also constantly rising by the deposit. Thus the river bed, the natural levee, and the river swamp, all rise together, maintaining a certain constant relation to one another.

"This constant relation is interfered with by the construction of artificial levees. These are constructed for the purpose of confining the river within its banks, and thus reclaiming the fertile lands of the river swamp. As the bed of the river continues to rise by deposit, the levees must be constantly elevated in proportion; but the river swamp, being deprived of its share of deposit, does not rise. Thus, under the combined effect of human and river agencies conteuding for mastery, an ever-increasing embankment is formed, until finally the river runs in an aqueduct elevated far above the surrounding plain. This is very remarkably the case with the river Po, which is said to run in a channel that has been thus elevated above the tops of the houses in the town of Ferrara. It is probable that the effect of levees in raising the river bed has been greatly exaggerated. Fig. 3 is an ideal cross section of a river and flood-plain left at first to the action of natural causes for a time, but afterwards interfered with by the construction of artificial levees. The dotted strata show the work of nature, and the undotted the work of man. It is easy to see that the destructive effects of overflow from accidental crevasses become greater and greater with the elevation. The Po has thus several times broken through its levees and deserted its bed, destroying several villages. The best examples of rivers successfully leveed are those of Italy and Holland. The Mississippi has never been successfully leveed; but if it should be, it would commence to build up a similar aqueduct, until the whole bed of the river would finally rise above the level of the river swamp."

Assessed Valuation and Production of the Principal Quicksilver Mines in California, for Three Years Past.

Mineral Surveyors Appointed.— The following have been appointed U. S. deputy mineral surveyors by U. S. Surveyor-General Wagner, as provided by section 2,344 of the revised statutes; R. M. Wilson, San Francisco; A. A. Smith, Susanville; L. L. Hawkins, Oakland; J. E. Jackson, Los Angeles; F. S. Ingalls, Salinas; A. T. Herrmann, San Jose; A. B. Brauvais, Columbia; Thomas Creighton, Visalia; John Doherty, Oaklaud; P. Y. Baker, Visalia; H.S. Bradley, Nevada City; E. C. Wren, Dutch Flat; John A. Brown, Sutter Creek; William Magee, Shasta; E. T. Wright, Los Angeles; A. W. Keddie, Quincy; William Jahine, Placerville; W. S. Lowden, Weaverville; J. M. Anderson, Placerville; R. B. Thomas, Mariposa; C. W. Hendel, La Porte; Samuel Bethel, Grass Valley; C. L. Anderson, Bodie; John Goldsworthy, Los Angeles; A. L. Cox, Santa Rosa; J. E. Woods, San Francisco; J. B. Hiskey, Bodie; James McGann, Chico; L. F. Cooper, Crescent City; T. R. Fillebrown, Bakersfield; D. C. Hall, Quincy; T. W. Reece, Oroville; Chas. Kaufman, San Francisco; J. M. Doyle, Colusa; C. J. Fox, San Diego; H. J. Stevenson, Los Angeles.

Convenient for Miners.—J. S. Phillips has now in press the third edition of his "Explorers', Miners' and Metallurgists' Companion." It will be in two volumes, each complete in itself, and of pocket size. Volume I. will treat of testing and assaying rocks, veins and metallic minerals. Volume II. will treat of mining and metallurgy, of mines and the reduction of minerals. His system of blowpipe analysis will be contained in the first volume. The edition will be issued in about three months.

The total valuation of property in San Francisco for 1878–9 is $214,476,470, against $254,867,050 last year.

Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be sent to us by mail or express prepaid. Each article will be numbered, marked with the name of the donor and the locality, and safely kept. A full account of the place, occurrence, etc., adds much to the value of such contributions. In another column we will gladly answer any reasonable questions regarding specimens so contributed.

No. 551. Specimen of chrome iron ore from the vicinity of Grass Valley, Nevada county, Cal. Presented by M. C. Taylor.

No. 552. Specimen of magnetite, probably mixed with chromite, from a ledge near Grass Valley, Nevada county, Cal. Presented by M. C. Taylor.

An Explanation in Order.

We print in an adjacent column a table which has been furnished us, showing the assessed valuation and production of the principal quicksilver mines in California for three years past. The first two years' estimates are made upon actual returns; the third year calculated upon current year for the returns of the six months just passed. This table gives for the following productions of the various mines the most peculiar variation in the assessments per flask:

	Flasks Produced.	Assessed per flask.
Redington	25,494	$15.89
Sulphur Bank	30,839	10.08
Great Western	14,266	9 84
Oakland	4,687	7.11
New Idria	17,846	10.74
Guadalupe	18,052	13.30
Total,	112,094	Grand Average, 11.90

The return of New Almaden for the same period is put down as 56.488 flasks; average assessment per flask, $17.66. Now, while this latter mine has produced for this period just about half the total of the other mines, its assessed valuation is put down at $997,647, as against $1,334,844, the total assessed valuation of the other mines. If now we take the only just basis for tax valuation of mines, the actual production we find, according to these figures, a discrimination against New Almaden of over $300,000 in assessed valuation, or of $5.76 per flask produced above the average of the other assessed valuations.

If these figures are, as we have every reason to believe, correct, it is a matter calling for investigation. It is certainly unfair to all parties to have such a wide variation in assessments of properties of the same nature. The actual production of a mine, as we have just remarked, is the only just basis upon which a tax assessment can be made. No man living can form a perfectly just determination of the future value of a mining property. The best of experts always differ on such estimates, and how much less able must he the average county assessor to judge of such subjects. Therefore, we claim that in such cases the production should be made the basis for such calculations. However, it may be that an explanation will be forthcoming. We shall be glad to hear it.

A Plea for Our Agents.

We believe that the agents whom we send out in various directions to present the claims of the Press, and to make collections of monies due us, are trustworthy gentlemen. At all events, we will not knowingly send out a man who is not such. The work of an agent is not pastime. It is a life of unrest, oftentimes of continued exposure to burning sun and stifling dust or driving storm. Many times he has to make a long turn out of his way to reach a single subscriber, and we ask that whenever it is possible he may receive the money which he seeks. Unless necessity compels it, do not put him off; but, when his credentials are proper, honor his claim. We do not wish our patrons to wait for the coming of the collector, but to send us the money as soon as they can do so, because the early use of the coin may help us along greatly in maintaining the standard of our paper. But when the collector comes before the remittance is made, please let him have it.

Our agents are of great value to us and to our readers, not alone in extending our subscription list and thus furnishing us the materials for strengthening and improving our paper. They help us greatly in keeping our journal abreast of the industrial progress which is being made in the different regions of the coast. We could not afford to send them out merely as correspondents, and yet they do splendid work in this line and send us budgets of fresh facts, new and successful practices, etc, which the editor on his lonely perch might never know without them.

We invite all our readers to be frank with our agents. Tell them what you like and what you do not like, what you know and what you need to know. You may tell them the paper might be better if the editor had more brains. You may criticise freely; in fact, we invite you to do so. If you think think the paper deserves it, criticise it so severely that the agent's report will make the editor go home and spank the baby to conceal his mortification—but do not put off the agent without the money if you can help it.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

Fig.1

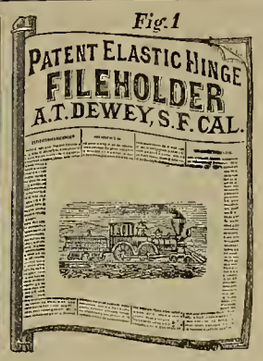

Fig.2

Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge filehalder for over a year past, the *News* cheerfully indorses it as the best newspaper filehalder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper filehalder. Samples by mail fifty cents.—*Gold Hill News.*

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is uncqualed by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
A. C. KNOX—Pacific Coast.
C. N. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMPION—Tulare, Fresno and Inyo counties.
W. D. WHITE—San Bernardino county.
J. W. A. WRIGHT.—Tulare, Fresno and Kern counties.
E. M. DENNY.—Oregon.
H. E. HALLETT.—Mendocino county.
O. W. MCGREW.—Santa Clara county.
RICHARD ALLEN.—British Columbia.
R. D. NUNNALLY.—Siskiyou County, Cal.
DR. W. G. ALBAN.—State of Nevada.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, $2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and subscribers against the acts and mistakes of others.

THE EXPLORERS,' MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 672 pages and 83 engravings. By J. S. Phillips, M. E. Price—cloth, $10.50; in leather, $12; postage 50 cents. Sold at this office.

MR. W. J. WOODLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

The Agents of this Paper and some of the Best and most careful Railroad men carry

Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special length and size. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

Market, head of Front Street, San Francisco.

Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Ranch.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for an illustrated paper containing information about Shasta County and these lands, to the proprietor of Reading Ranch.

EDWARD FRISBIE.

Anderson, Shasta County, Cal.

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 3 50
One man, per day	3 00
Wood, 1¼ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

Judge Wm. Webster, Paymaster Mine, Reno, Nev.
Lewis Chalmers, Manager Exchequer and IXL Mines, Silver Mountain, Cal.
J. S. Cone, Vice-President Tehama County Bank, Red Bluff, Cal.
R. H. Campbell, Superintendent Afterthought Mine, Redding; Shasta County, Cal.

SAN FRANCISCO.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

BODIE and ESMERALDA.

Being an account of the Past and Present affairs of these interesting Mining Districts, with detailed descriptions of leading mines, including Maps and Illustrations, by Jos. Wasson.

Single copies, post-paid from this office, $1.

YOSEMITE FALLS HOTEL,

(Formerly Hutchings')

YOSEMITE VALLEY, CAL.

CONNECTED WITH THIS HOTEL ARE

J. C. SMITH'S CELEBRATED

Hot and Cold Bathing Establishment,

Post Office, Telegraph Office

—AND—

Wells, Fargo's Express.

This is the only Hotel in this Valley with cottages separate from the main building and located immediately on the margin of the beautiful waters of the Merced river. Our

DINING ROOM,

Also on the river, looks out under shady trees and over green lawns, with a Grand View in a Direct Line of the Yosemite Falls, 2,634 Feet High.

INVALIDS AND PARTIES

Who cannot endure the fatigue of horseback riding, can see all the principal points of interest from the porches of this Hotel.

JOHN K. BARNARD, Proprietor.

ANDERSON & RANDOLPH,

JEWELERS,

(CLOCK TOWER BUILDING),

Cor. Montgomery and Sutter Streets,

SAN FRANCISCO, CAL.,

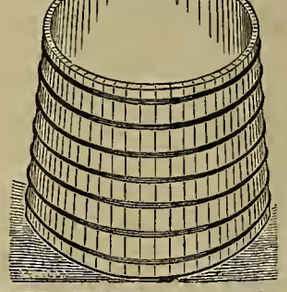
Call the attention of the public to their extensive display of

WATCHES, DIAMONDS, JEWELRY AND SILVERWARE.

The largest stock in the City at the lowest prices.

Goods sent to all parts of the Coast.

Watches repaired in a superior manner.



WATER TANKS of any capacity made entirely machinery. Materials the best in use; construction excelled. Pan Staves, Tubs and Oak Guides for mining purposes a specialty.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission and Fremont Streets.

HOME IN THE COUNTRY!

NOOK FARM.

Families wishing to spend the summer in the country will find this a cheerful home, and beautiful scenery of such endless variety as tempt to healthful exercise and recreation. We furnish good accommodations and an excellent table. Good fishing and hunting on the premises. Two trains from San Francisco, per Vallejo and Napa Valley Railroad, pass the Station daily.

Address, E. B. SMITH, Rutherford, Napa County, Cal.

Established in 1856, G. F. Deetken, Manager.

PIONEER REDUCTION WORKS,

Channel Street, Foot of 4th, San Francisco.

☞Gold Silver and Copper Ores purchased at highest rates, also reduced on commission. Working tests made.

Mining Share Market.

The past week has shown another wave in the stock market, but it has been such a slight wave as to hardly deserve the name of ripple. The Comstock favorites of the last two weeks seem to hold their own well. Ophir shows a slight rise up to Tuesday, and a drop again Wednesday. Mexican scored highest on Monday; Wednesday showed a fall of $2. Union Con. gives about the same record. It seems to be conceded that the Sierra Nevada rich strike is really in Union ground. Encouraging reports have come from Julia, but that stock too shows the same wave, its crest appearing on Monday. Justice culminated on Tuesday, and on Wednesday shared the general decline. Very good report came from this mine. In sinking a winze from the 1300-foot level on the south line, they met ore which at first assayed $3, but had reached $20 on the 20th. Bullion has reported the "best indications ever found in the mine." But reference to the quotations shows no rise proportionate to the flattering report. Here is the secret of the wavering market. Every report is "indications," indications." What the dealers are waiting for now, is exact knowledge of the whereabouts of the rich strikes foreshadowed by these "indications."

The Bodie stocks have described about the same movements as the Comstock, except that the Bodie ascent of the wave was rather more rapid. A rise took place in Blackhawk. It was caused by a rumor of richness, which, according to the Bodie *Standard*, is perhaps well founded. Experts have visited the mine, which is made quite public, and have spoken well of it.

The market is no doubt active and is influencing general business, but nothing of great moment is occurring.

New Incorporations.

The following companies have filed certificates of incorporation:

QUEEN BEE M. Co.—Capital, $6,000,000. Directors—George Osgood, John Turner, E. B. Dickinson, B. B. Minor and W. H. Sears.

GIBSONVILLE G. M. Co., OF SIERRA COUNTY.—Capital stock, $110,000. Directors—John N. Kifer, J. E. Perry, Geo. McLeod, R. D. Sheppard and J. L. Gould.

THE QUESNELLE Q. M. Co., OF CARIBOO.

THE MONO AND CROSS CON. M. Co.—Directors—W. H. Dolman, George W. Rogan, H. H. Flagg, George W. Hopkins and C. W. Hoare. Capital stock $10,000.000.

APPLEGATE GRAND M. Co., DOUGLAS COUNTY, OREGON.—Capital stock, $500,000.

HIGHBRIDGE S. M. Co., NYE COUNTY, NEV.—Directors—Stephen Roberts, W. S. Gage, George Williams, John F. Cassel and David Goodman. Capital, $10,000,000.

THE MONO GOLD M. Co.—Capital stock of $5,000,000. The Directors are Thomas Bell, William M. Lent, John F. Boyd, C. A. Burgess, and Lewis Teese, Jr.

CALIFORNIA G. M. Co.—Directors—Clinton Gurnie, Fred. W. Hadley, J. H. H. Williams, James S. Kennedy and F. Stone. Capital, $10,000,000.

ESMERALDA M. Co.—Directors, C. Reilly, W. A. Williams, M. G. Nixon, E. C. Loche, John B. Murphy. Capital, $10,000,000.

CHIEFTAIN G. M. Co.—Directors, Geo. W. Kidd, L. Greenebaum, Robt. Sherwood, J. M. Verdenal, H. Charles. Capital $10,000,000.

SOUTH BODIE M. Co.—Directors—B. B. Minor, W. H. Brown, Henry Deas, E. C. Morton, Robert Barton. Capital, $10,000,000.

THE CROESUS G. & S. M. Co.—Directors—A. W. Robinson, C. W. Kellogg, P. J. White, G. Alexander and Andrew Jackson Landis. Capital stock, $5,000,000.

DEFIANCE G. M. Co.—Capital, $5,000,000. Directors—C. A. Burgess, A. Garrard, George B. Sessions, W. B. Davenport and William Willis.

CON. PACIFIC CO.—Capital, $6,000,000. Directors—J. G. McClinton, S. L. Theller, E. B. Dickinson, E. F. Preston and Nathan Atkinson.

The Fair Season.

The following is a partial list of the coming fairs. We shall be pleased to add to it if readers will send us the dates and locations of their respective exhibitions:

San Francisco Mechanics' Institute, San Francisco, August 13th to September 14th.

California State Agricultural Society, September 16th to 21st, inclusive.

Oregon State fair, at Salem, October 8th to 18th, inclusive.

Nevada State Agricultural, Mining and Mechanical fair, at Reno, October 7th to 12th, inclusive.

Montana Agricultural, Mineral and Mechanical fair, at Helena, September 23d to 29th, inclusive.

Sonoma and Marin district fair, at Petaluma, September 23d to 28th, inclusive.

San Joaquin valley district fair, at Stockton, September 24th to 28th, inclusive.

Northern district fair, at Marysville, September 23d to 28th, inclusive.

Golden Gate district fair, at Oakland, September 9th to 16th, inclusive.

Napa and Solano district fair, at Vallejo, September 3d.

Monterey county district fair, at Salinas City, October 8th to 12th inclusive.

Siskiyou county fair, at Yreka, October 2d to 5th, inclusive.

El Dorado county fair, at Placerville, September 13th to 15th, inclusive.

Santa Clara valley fair, at San Jose, September 30th to October 5th, inclusive.

Stanislaus County Stock Growers Fair, at Modesto, October 9th to 11th inclusive.

Southern California Horticultural Fair, at Los Angeles, October 14th to October 19th, inclusive.

Southern California Agricultural Society's Fair, at Los Angeles, October 14th to October 19th, inclusive.

Plumas, Lassen and Modoc District Fair, at Susanville Lassen county, October 21st to 25th inclusive.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING AUGUST 6TH, 1878.

STEAM ENGINES—George E. Dow, S. F.
BALL TARGETS—Horace P. Fletcher, S. F.
PUMPS—Eugene Hawkes, San Diego, Cal.
WAGON JACKS—James B. Newland, Sacramento.
WIRE ROPE WAYS—Ambrose Blatchley, Kernville, Cal.
VEHICLE TORSION SPRINGS—Frank M. Chapin and Joshua Gersbacher, Cuffey's Cove, Cal.

TRADE-MARKS.

COFFEES AND SPICES—John Prusso, Oakland, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

[Communicated.]

The Pacific Mineral Land Company.

A company will shortly be incorporated, under the above name, in this city with a large capital stock, for the purpose of acquiring and working mineral land on the Pacific coast of the United States and adjoining countries. The company will mine coal, iron, silver, gold and other minerals, sink petroleum wells, make coke and establish iron manufactories, build railroads where necessary, own and run steamers, and seek in every profitable manner to develop the resources of this coast.

A gentleman of life-long practical experience in the coal and petroleum regions of the East will devote his services to the company as President. A special feature will be made of coal, the safest and most lasting of all the minerals. Arrangements have already been made for the acquisition of valuable and accessible coal fields on the northern part of the coast, work on which will be commenced without delay. It is intended before New Year's to lay down coal of the best quality in San Francisco at lower price than has yet been done. The company will arrange for the immediate construction of large and powerful steamers suited for carrying coal, merchandise and passengers, thus ensuring the shipping of their coal at a small expense.

A sufficient working capital for all purposes will render further calls on the stockholders unnecessary, and no assessment will be levied on the stock. Every facility will at all times be offered for full examination of the company's affairs by individual shareholders. Gentlemen well and honorably known both here and in the East are interested in the undertaking, and their names are a guarantee that the affairs of the company will be conducted in a perfectly fair and honorable manner. A large amount of stock has already been applied for in this country and in Europe.

This will be the strongest company ever organized on this coast, and offers unequaled inducements for the safe and profitable investment of capital, the stability and sure rise in value of real estate being here combined with the profits of mining and manufacturing, whilst the variety of operations to be carried on reduces the risk to a minimum.

Further particulars will be announced in these columns in the course of a few weeks.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Excelsior Silver Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Potosi District, Lincoln County, Nevada.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the 16th day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
Floris Antunovich	234	100	$25 00
Sarah Feeney	229	25	6 25
Jerome Horn	274	200	50 00
Horn, Julia F	265	50	12 50
A W Lind	264	50	12 50
J Michelson	263	100	25 00
Adolph Wirtner	268	80	20 00
S D Steevins	218	100	25 00
A Romero, trustee	222	200	50 00
A Romero, trustee	223	200	50 00
N Dahovich	271	100	25 00
N Dahovich	272	100	25 00
N Dahovich	273	600	150 00

And in accordance with law, and an order of the Board of Directors, made on the 16th day of July, A. D., 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 304 Post street, on the sixth day of September, A. D., 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

FRANCIS P. DEVINE, Sec'y.

Office, No. 304 Post Street, San Francisco, Cal.

Gover Mining & Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of August, 1878, an assessment (No. 37,) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Monday, September 23rd, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, October 21st, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal

Pocahontas Gold Mining Company.—Location of Principal Place of Business, San Francisco, California. Location of Works, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of August, 1878, an assessment (No. 14) of One Dollar and a Half ($1,50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 9, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Wednesday, the 23rd day of October, 1878, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors

M. C. SOUTHARD, Sec'y.

Office, Room No. 9, 411½ California street, San Francisco, California.

Seaton Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Drytown Mining District, Amador County, California.

NOTICE.—There is delinquent upon the following described stock, on account of Assessment (No. 11) levied on the 26th day of June, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Thompson, W., Jr	72	15	$1125 00
Thompson, W, Jr	79	10	750 00

And in accordance with law and an order of the Board of Directors, made on the twenty-sixth day of June, 1878, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 58 Nevada Block, northwest corner Pine and Montgomery streets, San Francisco, California, on Wednesday, the twenty-first day of August, 1878, at the hour of one o'clock P. M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of the sale.

JOEL F. LIGHTNER, Sec'y.

Office, Room No 58 Nevada Block, Northwest corner Pine and Montgomery streets, San Francisco, California.

Office South Comstock Gold and Silver Mining Company. Notice.—The annual meeting of the stockholders of the South Comstock Gold and Silver Mining Company, for the election of Trustees and the transaction of such other business as may be presented, will be held on Monday, the 19th day of August, 1878, at two o'clock P. M. of that day, at the office of the Company. Transfer books will be closed on Saturday, August 10th, 1878, at the hour of 12 M. of that day.

J. M. BUFFINGTON, Secretary.

Office—Rooms 3 and 4, second floor, No. 309 California street, over Aetna Insurance office.

Telegraph Copper and Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gopher Mining District, Calaveras County, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1,) levied on the seventeenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No Certificate.	No. Shares.	Am't.
Howland, J M	Not issued	1350⅝	$ 40 52
Jones, C C	Not issued	5640	169 20
McCrea, Wm	Not issued	4999	149 97
Bollinger, J C	Not issued	17,166	514 98

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of July, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 2, 528 California street, San Francisco, California, on Monday, the ninth (9th) day of September, 1878, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. T. MILLIKEN, Secretary.

Office, Room 2, No 528 California street, San Francisco, California.

Vigorit Powder Company.—Location of works, California City, Marin County, State of California. Location of principal place of business, City and County of San Francisco, California.

Notice is hereby given that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 1) of fifty cents (50c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No 1, 109 California street, in the City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the twelfth day of September, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the second day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expense of sale.

JAS. W. BAKER, Sec'y.

Office, 109 California street, Room No. 1, City and County of San Francisco, California.

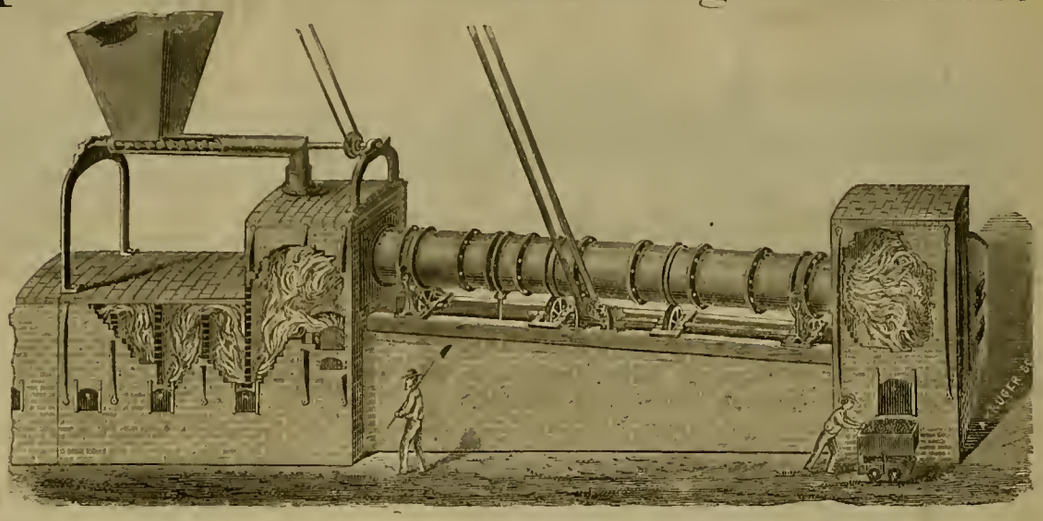
Howell's Improved White Roasting Furnace.



This cut represents the most improved construction of this unrivaled Furnace, the superiority of which, over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as in none of them are combined all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade

The first cost, as well as the cost of operating it, is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and will furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents. It has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana, viz: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice.

At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. J. M. Thompson, who is owner of an interest in the White patents, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby **caution** all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

No. 209 Sansome Street, San Francisco.

Elephant Ore Stamp.

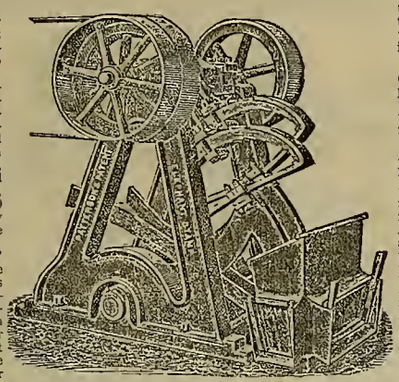
We beg to call your attention to this engraving representing the "Elephant Ore Stamp." The advantages claimed for this Stamp are as follows·

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse power Engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.



The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

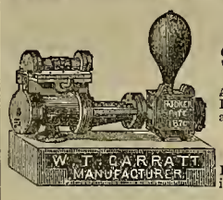
BRASS CASTINGS of all kinds,
WATER GATES, GAS GATES,
FIRE HYDRANTS,
DOCK HYDRANTS,
GARDEN HYDRANTS

A General Assortment of Engineers' Findings.



Hooker's Patent Celebrated

STEAM PUMP

☞ The Best and Most Durable in use. Also, a variety of other

PUMPS

For Mining and Farming Purposes.

ROOT'S BLAST BLOWERS,
For Ventilating Mines and for Smelting Works.
HYDRAULIC PIPES AND NOZZLES,
For Mining Purposes.
Garratt's Improved Journal Metal.
IMPORTER OF
IRON PIPE AND MALLEABLE IRON FITTINGS.
ALL KINDS OF
WORK AND COMPOSITION NAILS,
AT LOWEST RATES.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento Valley. His advertisement appears from time to time in this paper.

MINING MACHINERY DEPOT.

Rock Drills, Air Compressors—Burleigh's.

Machinists' Tools—Putnam's. Compound Steam Pumps—Walker's. Plunger Pumps—Cope & Maxwell. Bucket Plunge Pumps—Valley Machine Co. Centrifugal Pumps—Heald & Cisco's. Vertical Steam Engines, Hoisting Engines—Haskin's. Chemical Engines, Hook and Ladder Trucks, Fire Extinguishers—Babcock & Champion. Farmer's Electro Battery. Hill's Exploders. Stow's Flexible Shaft.

OLINE COMPOUND FOR LUBRICATING MACHINERY. FLOWER'S STOP-VALVES FOR STEAM, WATER OR GAS. PLANING, TONGUING, GROOVING AND DOUBLE SURFACING MACHINERY—PUTNAM'S MOORSE'S TWIST DRILLS. PATENT TWIST DRILL GRINDING MACHINE—VAN HAGAN'S. EMERY WHEELS AND STANDS. SAW GUMMERS—WOOD'S. STEAM INJECTORS.

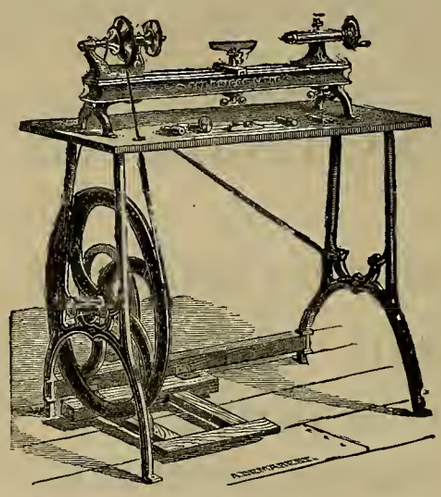
Rubber Hose, Packing & Belting, Wired Suction Hose, Carbolized Hose, Steam Hose.

Send for Circular.

PARKE & LACY, 417 Market Street, San Francisco.

THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone-pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur center for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

—FOR SALE BY—

DUNHAM, CARRIGAN & CO.

SAN FRANCISCO.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS,
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞ Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO., San Francisco.

SAN FRANCISCO, SATURDAY, AUGUST 31, 1878.

VOLUME XXXVII Number 9.

Measuring Rainfall and Percolation.

A few months ago a reader of the PRESS wrote to us, proposing the use of a box of earth standing on a platform scale to determine the amount of rain which sank into the earth instead of the common rain gauge, which measures the whole amount precipitated. This he thought would give a better idea of the effective value of a rainfall, because it would measure only that which went into the earth and not that which flowed away over the surface. We pointed out the manifest errors which would unavoidably attend the use of such a rain meter, and mentioned the lysimeter, which has been in use both in this country and in England, for determining the amount and quality of the water which percolates through a certain depth of soil. We believe there are three of these lysimeters now in use in this country, the latest being constructed on a farm, which a public-spirited citizen of New York State, Mr. Lawson Valentine, has placed at the disposal of the editors of the *American Agriculturist*, in order that they may test experimentally all proposed crops and cultures which they deem worthy of experiment, and for conducting other investigations. One of the first steps taken to equip this experimental farm was the construction of a lysimeter. As this apparatus is of such great possible value in this State, where so much depends upon the effective rainfall or the depth of penetration into the soil, we requested Mr. Libby, the editor of the *Agriculturist*, to send us an engraving of the lysimeter which they had constructed and details of its construction, so that any of our readers who desire to supplement the testimony of their rain gauges with a measure of the water percolating through the surface soil, might construct the apparatus for themselves.

The small engraving on this page shows the lysimeter complete. The idea in it is to put an arrangement for catching the water around a certain body of the soil without disturbing its natural condition. Thus it is obvious that water will percolate through it just as it does through the other soil in the field; and heavy rains which, in part, flow off over the surface without entering the soil, may also flow over the lysimeter and not enter into the measure of effective rain. By this it is obvious that a truer idea of the value of a rainfall can be had than by the common gauge which records all that falls.

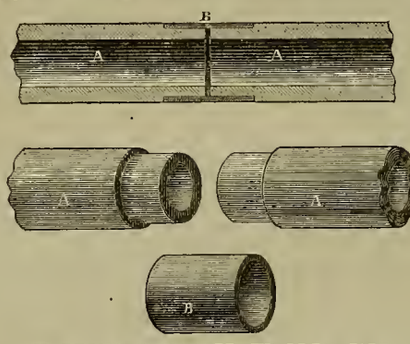
The *Agriculturist* describes its lysimeter as follows: A bottomless box, strongly made of two-inch plank, and about 45¾ inches square inside, and averaging 36 inches deep, was forced into the soil until its top was even with the surface. Then a frame of five-inch timber was let down outside the box, so that its upper side was two inches below the bottom of the box. An excavation was then made so as to expose one end of the box as shown in the engraving. A plank bottom, six inches each way larger than the box and covered with galvanized iron, was then forced beneath the box upon the timber frame by means of jack-screws, and picking out the earth before it with a sharpened stick. Thus the wood work was in place and it remained to make a water-tight joint between the sides and bottom of the box. Before the box was pushed down into the soil it was lined with galvanized iron, and the lining was allowed to extend up around the lower edges so that the metal came outside the box below. This metal was pushed down upon the iron cover of the bottom and the two were soldered together all around. The bottom inclines one and a half inches from back to front, and an opening is left at the lower side from which the water which percolates through the enclosed soil runs into a measure placed below. Room is left in front of the apparatus by stoning up the cavity dug in the earth, and this gives space to attend to the working of the lysimeter as appears in the engraving.

From this it appears that the construction of an approved apparatus for measuring amount of percolation is not expensive nor difficult. We should like to know that there would be many built in this State by interested observers, on different soils, so that the amount of percolation could be reported in connection with the figures of the rain gauge.

Horton's Wooden Pipe Joint.

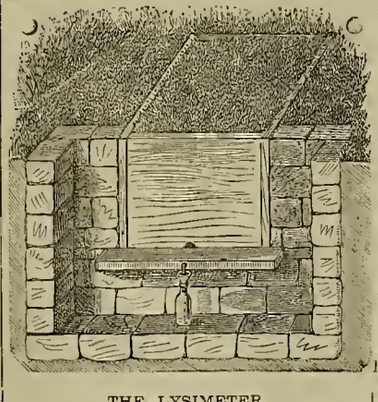
We illustrate on this page an improvement in wooden pipe joints recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Wm. N. Horton, of this city. This class of pipe is usually formed by boring out logs, so as to provide an opening of a certain size, and one end of each log is counter bored to receive the opposite end of each section, which is made small enough to enter the counter bore, and thus the lengths are joined and the pipe formed.

Two serious defects accompany this method of joining the pipes; the first is, that the section must be made much larger, in order to give the required strength to the joints, than could be needed to resist the pressure of water from the interior of the pipe; and the second is that the outside or shell of the counter bore is frequently destroyed by dry rot, or from other similar causes, on account of its not being kept wet; and the joint of the pipe is thus ruined.



HORTON'S IMPROVED WOODEN PIPE.

It is well known that when wood is kept saturated with water it is nearly indestructible; and Mr. Horton's invention contemplates so forming the joint that the water flowing into the pipe is allowed free access to the ends of the section, so that it may permeate the entire section through its pores and drive the sap out; also, in forming the joint by the aid of an exterior surrounding band, which does away with the counter bore, and thus enables the inventor to construct the pipe of sufficient strength to resist the pressure that may be brought to bear upon it, with only about one-half the wood needed in the ordinary method of construction.



THE LYSIMETER.

The engravings show the method devised by Mr. Horton. *A A* are two sections or lengths of pipe, which are bored out to form a water passage. In order to join these lengths of pipe solidly together, and at the same time have a space between their ends which will admit water which the pressure will force into the pores longitudinally, the ends of each section are turned down or reduced as shown, and fit upon these ends an iron or other suitable band, *B*. The shoulders upon the ends formed by the reduced portions of the pipes allow them to be driven into the band so as to nearly meet; but a small space is left between the meeting ends into which the water-way pass from the interior of the pipe. This water will pass longitudinally through the pores of the wood, thus expelling the sap and water-soak the wood, which will preserve it from decay. The band, *B*, is coated with asphaltum or other preservative substance.

This construction makes a very durable and strong pipe. By the pipe being made of smaller diameter for the same sized water passage, a great deal is saved in cost of transportation, and the pipes may also be made in small sections. In ordinary pipe about four inches in length must be allowed for the joint of the section, but in this the full measurement is utilized, and there is no danger of dry rot at the joints for the reasons mentioned.

New Machinery for the Alexander Mine.

We saw this week at the Golden State and Miners' Iron Works, on First street, part of a large lot of machinery which is being shipped to the Alexander mine, at Grantsville, Nye county, Nevada. There are upwards of 150 tons of the machinery altogether. It comprises a complete 20-stamp mill, pans, settlers, etc., and two furnaces, the whole being one of the most complete dry crushing silver mills lately built. The whole order is first-class in every respect, all possible improvements having been added.

The engine has a 20-inch cylinder with 48-inch stroke. The bed-plate of the engine weighs 13,000 pounds, and the cylinder weighs 6,000 pounds. The fly wheel weighs six tons and is 16 feet in diameter. The engine is fitted with Myers' cut-off, has a shaft 10 inches in diameter and is of 200 horse-power. The stamps weigh 50 pounds.

With the mill are 12 five-foot combination pans and six nine-foot settlers. There are also two of White's roasting furnaces.

The mine for which this machinery is intended has lately had 30 stamps running on its ore, but the work has been done at custom mills and the rock had to be hauled a considerable distance. It has therefore been considered necessary to order the machinery described for the mine, which is represented to be in a flourishing condition.

CHROME IRON.—Mr. A. W. Jackson, mineralogist of the State University, gives us the following list of localities in California where chromite is found. The list is made up from the labels on the specimens in the Berkeley collection, and does not pretend any better authority: Crescent City and Rockland district, Del Norte county; Mendocino county; Cloverdale, Sonoma; Grass Valley, Nevada; Butte; Placer; Volcano, Amador; near Griswold's and at Copperopolis, Calaveras; Jamestown and Chinese Camp, Tuolumne; Aurora, Fresno; San Geromino ranch and vicinity of Mt. Tamalpais, Marin; three miles north of Knox mine, Lake; Rock canyon, near Georgetown, and Hope valley, El Dorado; 60 miles north of Santa Barbara, near the head of the Salinas river.

The Mines and the Courts.

The Supreme Court has reversed the judgment and order, and remanded the cause for a new trial in the case of P. G. Gelcich vs. Moriarty et al., and Holland et al., vs. Mount Auburn Gold Quartz mining company. The latter case is interesting. The claim which lies about two miles west of Nevada City, on Ragon Flat, was located in 1866 by O. S. Holbrook. It consists of 1,500 linear feet of a quartz lode. Subsequently it was deeded to one Solomon Johnson, who in turn deeded it in 1872 to the Mount Auburn Gold Quartz mining company, an incorporated company. This company erected hoisting works and expended several thousand dollars in working the claim up till the year 1875, when it is alleged the necessary amount of work was not expended. On the 25th of August, 1876, J. L. Holland and Edwin Tilley relocated or "jumped" it. On the 29th of the same month, Johnson, who was Superintendent of the company, commenced work on the claim, and on the 15th of September, on complaint of Holland and Tilley, an injunction was served upon him to cease work. Holland and Tilley commenced suit for the ejectment of the Mount Auburn company. Judgment was given to plaintiff and motion for new trial overruled. This, however, as above, the Supreme Court has reversed. The ground for reversion was this: On relocating the plaintiff did not mark his boundaries according to law. He posted two notices, one at the north end and the other at the south end of the claim. The law requires that the location be distinctly marked on the ground so that its boundaries can be readily traced. Hence the reversion.

W. P. Harrington, in the 19th District Court, asks that the trustees of the Warra Whata S. M. Co. be restrained from selling stock, removed from office and a receiver appointed pending a new election. The trustees, he charges, seek to dispose of the working capital for other than the original purpose.

In the same court the Rough & Ready M. Co. ask to have adjudicated the conflicting claims between themselves and the following: Justice G. & S. M. Co., Woodville Con. S. M. Co., and Woodville G. & S. M. Co. It is charged by the complainants that within two years past the Woodville G. & S. M. Co., confederating and conspiring with the other defendants to cheat and defraud plaintiff, has unlawfully entered upon plaintiff's property, and has abstracted therefrom a large amount of ore, of the value of $1,000,000; that the Justice M. Co. has abstracted $3,000,000 worth of ore; that some time in April, 1876, the defendants ran a drift or tunnel into the shaft sunk by the plaintiff on its lode or vein of ore, and built fires in said drift or tunnel, near to or in the shaft of plaintiff's mine, and smoked out workmen employed by plaintiff in its mine.

The Blue Tent M. Co. are having trouble about an old abandoned water right which they have appropriated.

The great mining suit between the Reese G. & S. M. Co. and Rye Patch Con. M. Co., came up for trial in Winnemucca. The suit involves the title to and right of possession of the Alpha mine and $225,000 damages. A jury was empaneled to try the case, and hosts of witnesses for both parties from different parts of the State were in attendance. But the case was postponed until the October term, on the defendant's asserting that the plaintiff never was, and is not now an incorporation under the laws of California or otherwise. Meanwhile defendant is enjoined from extracting ores on the plaintiff giving indemnity bonds.

Suits have been brought for ejectment in the United States Circuit Court by S. L. M. Barlow and Wm. Butler Duncan, of New York, both prominent capitalists, against the Belcher, the Tioga, and the Black Hawk Mining Companies. It is stated that these mines comprise a portion of the property of the Empire G. and S. M. Co., of New York, which was incorporated under the laws of New York in 1864; that in 1865 this company built the Empire mill at Bodie, now called the Syndicate, which cost them about $100,000, and worked their mines continuously until 1867 or 1868; that they held complete possession until 1875, when the property was sold for taxes. The company is reported to have expended from $300,000 to $500,000 in developing these mines.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

From Arizona.

EDITORS PRESS:—Two years ago repeated shipments of silver nuggets were made from the Richmond hasin in this district to San Francisco. The claim from wbich these consignments came was described as a sort of placer, and it was] hinted that there was nothing in the vicinity indicating the origin of the deposit. I visited the Basin recently and was much interested in the place and its strange and nearly worked out eurface mines. Running across the upper or uortherly end of the depression, from which most of the nuggets were taken, there is a strong quartz vein kuown as the McMorris mine. On the upper side of the lode a spring of cool, clear water rises to the surface, and after looking at its surroundings I came to the conclusion that this spring is all that remains of a fountain that hollowed out the basin and deposited the eilver found there. In far back ages a powerful hot mineral epring probably rose on the western slope of what is now known as the Apache mountains. As the water from this fountain flowed towards the southwest it would gradually dissolve the eolid rock, and from its connection with the quartz vein, either then formed or in course of formation partly through its agency, this water would perhaps have some silver in solution. Into the basin it had created this silver would be carried, to be there deposited on flat surfaces with the cooling of the water as thin ecales, or in cavities in countless other forms. As disintegration went on, the nuggets and flakes of silver would be mixed with the soil and debris, but at the bottom on the smooth, rocky floor the deposit would he heavier than anywhere else. In the mining operations of the owners this was found to be the case, and wherever there were eeams in the rocks that could be entered by water, thin scalee of silver were detected—too thin, in most cases, to pay for the labor incurred in following them.

The appearance of the McMorris lode, near the spring, seems to prove that the two bear some relation to each other. The main lode there is very large, and sends out obliquely, on its lower or basin side, several strong spurs, heavily charged with rich ore. The same vein farther to the east and the west is small and does not appear to have either spurs or much high-grade metal. I am inclined therefore to believe tbat the McMorris mine and the basin deposit owe a good deal to the mineralized water, but then my theory after all may have nothing in it. It does no harm, however, to theorize a little in such matters, particularly where there is room for a dozen such theories to stand abreast.

Patagonia District.

A reliable California friend, who has been in the Territory for some months, writes me from Tucson in regard to the above district, which lies some 70 miles east and south of this place: "I arrived here yesterday from Patagonia district. The country is looking fine. There is green grass all over the hills. Weather pleasant. We have had showers almost every day for the past two weeks. The climate is something like that of San Jose valley. The mines are being vigorously opened and look well. The ledges are large and continue down as far as exposed. The Holland mine shows a ledge of sohd ore, 20 feet wide, which averages $100 per ton. The Washington lode has one 40-foot shaft and three others of a less depth. By these openinge it is proved that there is a continuous body of ore in the mine, 250 feet in length by 30 feet in width, and at least 20 feet in depth, which averages $114 per ton. The St. Louis mine has a shaft 50 feet deep, all in ore which averages $96. On the surface this vein is 20 feet wide. These lodes are hetween granite and limestone, the latter sometimes forming a cap over the croppings. Adjoiniug the above claims, to the south, are several old mines, worked many years ago, hut left on account of the Indians. They are patented and will soon he in operation again. The ore on the dumps is good. The Empire is one of the old mines, and near it is the San Antonio, which produced rich hullion hy means of a Mexican furnace. About five miles north from that point, on the same mineral helt, is the old Mowry mine and emelting works. A gentleman who worked it on a lease for a year and employed 150 men, made it pay handsomely, the hullion he obtained heing worth $300 per ton. He says there is plenty of ore in the mine yet and it smelts very easily. Some pockets of ore assayed as high as $1,000 per ton.

"The Lone Star is another good mine. It is thought that this lode is 100 feet wide. On the extension which is known as the Ella claim, an open cut shows 73 feet of ore which averages $40 per ton. Every one who visits the district goes away with good impressions. I feel sure we have here another Ruby Hill, such as that at Eureka, Nevada."

Short Summary—Globe District.

I give you a condensed summary of the mining news here. The Stonewall Jackson strike in the main lode improves. Three grades of ore are obtainable, $5,000, $750 and $100. A fine discovery has heen made in the Mexican mine 30 feet down; a vein four feet wide with ore assaying from $300 to $400. About 40 pounds of silver nuggets, assaying $10 to $12 per pound, have been fished up half a mile from the Mexican, and several promising veins located. Work has heen started on the Silver Belle by Oakland gentlemen. The Buckeye lode has been cut across 112 feet deep, and is over 15 feet wide. From assays it is said that the whole width will average from $50 to $75 per ton. On the hanging wall there is a very rich strike of blast sulphurets. The Miami mine looks well, hut work has been stopped on it. The Etna and Silver Era mines have 10 tons more of rich ore on the way to the Miami mill. Work has beeu suspended on the Isabella company's mines, but a road is being opened between them and Globe.

Weather pleasant and showery. Hills all green and everything in the district generally looking well. J. D. E.

Globe District, Pinal Co., Arizona, Aug. 7th.

Facts and Questions about the Phylloxera.

EDITORS PRESS:—The enclosed communication from Mr. Henry G. Hanks was lately received by the Governor, and hy him referred to me for action thereon. The session of the University having begun, I am unable to do what would doubtless he the most certaiu mode of getting the desired information, namely, to go out among the vine growers and see for myself. I have repeatedly tried, both by private letters and public calls, to obtain current information on this important subject; hut the vine growers have, as a rule, failed to respond, whether from indifference or from an unwillingness to look the matter in the face, or finally from a fear that the knowledge of the existence of the phylloxera in their neighborhood might injure the sale of their lands and wines.

It seems to me that the time for the abaudonment of this short-sighted policy has come, when it is currently reported that the business failure of a large and once prosperous association is mainly due to the ravages of the phylloxera. If the facts are not now fairly stated, and the do-nothing policy replaced by an intelligent consideration of the possible preventives and remedies, the evil will be magnified beyond its real proportions by the tongue of rumor, and whatever damage can result therefrom to the vine growers will be correspondingly increased.

I hope the questions of the Duchess of Fitz-James will reccive attention and answer from the many intelligent gentlemen able to furnish the desired information, which is fully as much needed for California as for France. Whatever replies may be given, either through the columns of your paper, or directly to this department hy letter, will he duly recorded and finally transmitted to the Duchess and to the French minister of agriculture, with credit to the several authore.

It is scarcely necessary to repeat here, at this time, my often-given assurance that all questions relating to this or any other agricultural subject, transmitted to me with the needful information in detail, will receive, as heretofore, prompt attention and investigation without charge, provided only that the question is not of purely individual interest. One question deserving immediate attention is the reported fact of the existence, within the districts invaded hy the phylloxera, of particular tracts of soil in which the ineect does not seem to he ahle to do any material injury, even to the Mission grape. If this is so, then the investigation of the peculiarities of such soil is of the most direct pecuniary interest to every vine-grower. —E. W. HILGARD, College of Agriculture, Berkeley, Cal.

Letter from Commissioner Hanks.

To His Excellency, the Governor of the State of California—Sir:—Since I have heen in Paris, I have taken considerable pains to obtain information relating to the ravages of the phylloxera, and to what has heen done in France to check them. I find at the exposition a numher of the so-called insecticides, which I have investigated as far as my limited time would allow. In making inquiry, I have formed the acquaintance of parties who arc deeply interested in this subject. I inclose a letter from the Duchess of Fitz-James, who is an extensive wine grower, and who will furnish information which may he of great interest to our State. I have since had an interview with the Minister of Agriculture, and Eugene Tisserand, Inspector-General of Agriculture, hoth of whom are very much interested in this eubject, who will furnish all the publications of the French government, and who desire such information as our State can furnish. I have thought if a committee of wine growers of California would take this matter in hand, much advantage to the State might he the result. The same gentlemeu might return answers to the questions which the Duchess of Fitz-James has asked, and which are inclosed in her letter.

I learn from the Minister of Agriculture that none of the insecticides have proved effective, and that the system of "over watering" the vines is the hest remedy yet tried. This plan, as I understand it, consists in irrigating the soil to that extent that the roots of the vinee and the soil around them remains saturated for 24 hours. I have no doubt the publications promised will give all information. I wish the magnificent publications of Mr. Edward Bosqui, of San Francisco, might be sent to the French government through the Minister of Agriculture. I am certain they would be appreciated. —HENRY G. HANKS, Exposition, Paris, France

Letter of the Duchess of Fitz-James.

The following extracts from the letter of the Duchess of Fitz-James, referred to above, will be found of interest in this connection: "As regards the chemical antidotes, I have examined and tried a great many processes, and have had no satisfaction out of any except the product of M. Tichet, chemist, 54 Rue de Lagny, Vinceunes. I think Mr. Hanks might get from him some very useful iuformation, albeit M. Tichet's practice in tbe destruction of the insect is a great deal better than his explanations. He has for seven years maintained 14 hectares against the phylloxera. I would use his process if I still had my vines. But having lost them I prefer to plant the resisting varieties."

What the product of M. Tichet is does not appear from the letter of the Duchess. The following are the questions upon which the lady asks light from California:

1. Does the phylloxera attack every sort and species of vine in California?
2. What varieties are most commonly grown?
3. What varietiee stand best against the phylloxera?
4. What is to be believed about the power of resistance of the following species, which thrive well in France as yet in the most infested districts: Yacquez, Herbemont, Rulander, Taylor, Cunningham; or the following on which opinions vary: Clinton, Concord, Morton's Virginia, Eumellan?

I possess about 700,000 vines of the abovementioned species, aged three, two, and one year. I know in my neighborhood a few Yacquez and Herbemonts, aged 16 years and prosperous.—DUCHESS OF FITZ-JAMES, St. Benezet, par St. Gilles, Gard, France.

The matter contained in these documents is o interest, although there is nothing very novel in them. It would be of value to all to collect facts concerning the real prevalence of phylloxera in this State. The search for hardy vines is wise, and the experience of the Duchess may be of advantage to us hereafter. California cannot tell her much about the vinee she names. They have not been tried to any extent here, because growers have not felt the need of insect-proof vines except in a restricted region of the State. We believe from our investigations and inquiry that the insect is at present confined to comparatively narrow territory, and it is pretty generally understood where that is located. It would be far hetter to have the eubject generally understood than to cover it up, hut one reason why the insect does not show up more generally is that it does not generally exist as yet. Our offer to make free microecopical examination of suspected vines and report results in confidence to the owners, as described in our issue of July 20th, ie still open.

Analysis of Sydney Coal.

EDITORS PRESS:—I enclose two assays of Sydney coals, which please publish for information of your readers. From another authority I learn that Greta Sydney coal is the hest that comes to this market from Australia for gas purposes, but a very inferior coal for steam. The Wallsend Sydney is counted the hest for steam; next comes Duchenfeld. Perhaps some of your correspondents will he good enough to give their experiences with eteam coals, and state the value of gas coke as a fuel compared with good coal or oak wood.

Wallsend.

A hright coal, luminated structure, well worked, breaks into irregular cuhoidal fragments, does not soil the fingers readily, contains a little fibrous mineral charcoal; epecific gravity, 1.333.

Analysis.

Moisture	2.75	
Volatile hydrocarbons	34.17	
Fixed carbon	57.22	Coke.
Ash	4.64	61.86%
Sulphur	1.22	
	100.00	

Coke much the same as Greta, but with large cauliflower-like excrescences. Ash of pinkish shade, heing white mixed with reddish particles.

Greta.

Very eimilar to Wallsend, hut with less mother-of-coal, does not soil the fingers, streaky appearance, fracture conchoidal across the layers; specific gravity, 1.289.

Analysis.

Moisture	2.25	
Volatile hydrocarbons	39.21	
Fixed carbon	54.41	Coke.
Ash	2.72	57.13%
Sulphur	1.41	
	100.00	

Coke good, firm, hright silvery lustre. Ash loose, buff colored.

The Atlantic and Pacific Forests.—No. 1.

[By PROF. ASA GRAY.]

On April 18th, 1878, after his visit to this coast, the well known botanist, Prof. Asa Gray, delivered a lecture before the Harvard University Natural History Society, on "Forest Geography and Archœology," which consisted in the main, of the meteorological conditions which prevail on the Atlantic and Pacific slopes of this country, and a comparison of the forests indigenous upon them. The subject is of such general interest and the writer of such high repute, that we shall present the lecture in full in a series of articlee as our space permits. For the ability to do this, we are indebted to the *American Journal of Science and Arts:*

It is the forests of the Northern temperate zone which we are to traverse. After taking some notes of them in their present condition and relations, we may inquire iuto their pedigree, and from a consideration of what and where the componeut trees have been in days of old, derive eome probable explanation of peculiarities which otherwise seem inexplicable and strange.

In speaking of our forests in their present condition, I mean not exactly as they are today, hut as they were before civilized man had materially interfered with them. In tbe district we inhabit, such interference is so recent that we have little difficulty in conceiving the condition which here prevailed, a few generations ago, when the "forest primeval," described in the first lines of a familiar poem, covered essentially the whole country, from the Gulf of St. Lawrence and Canada to Florida and Texas, from the Atlantic to beyond the Mississippi. This, our Atlantic forest, is oue of the largest and almost the richest of the temperate forests of the world. That is, it comprisee a greater diversity of species than any other, except one.

In crossing the country from the Atlantic westward, we leave the forest behind us when we pass the western bordere of those organized States which lie along the right bank of the Mississippi. We exchange it for prairies and open plains, wooded only along the watercourses; plains which grow more and more bare and less green as we proceed westward, with only some ecattering cottonwoods (*i. e., poplars*) on the immediate banke of the traversing rivers, which are themselves far between.

In the Rocky mountains we come again to forests, but only in narrow lines or patches; and if you travel by the Pacific railroad, you hardly come to any. The eastern and the interior desert plains meet along the comparatively low level of the divide which here is so opportune for the railway; but both north and south of this line the mountains tbemselves are fairly wooded. Beyond, through all the wide interior basin, and also north and south of it, the numerous mountain chains seem to be as bare as the alkaline plains they traverse, mostly north and south, and the plains bear nothing taller than sagebrush. But those who reach and climh these mountains find that their ravines and higher recesses nourish no small amount of timher, though the trees themselves are moetly small and always low.

When the western rim of this great hasin is reached there ie no abrupt change of scene. This rim is formed of the Sierra Nevada. Even its eastern elopes are forest-clad in great measure, while the western bear in some respects the nohlest and most remarkahle forest in the world; remarkable even for the number of species of evergreen trees occupying a comparatively narrow area, but especially for their wonderful development in size and altitude. Whatever may be claimed for individual eucalyptus trees in certain sheltered ravines of the southern part of Australia, it is probahle that there is no forest to be compared for grandeur with that which strctches, essentially unbroken, though often narrowed and nowhere very wide, from the eouthern part of the Sierra Nevada in lat. 36° to Puget eound beyond lat. 49°, and not a little farther.

Descending into the long valley of California, the forest changes, dwindles and mainly disappears. In the Pacific Coast Ranges it resumes ite eway, with altered features, some of them not less magnificent and of greater heauty. The redwoods of the coast, for instance, are little less gigantic than the big trees of the Sierra Nevada, and far handsomer and a thousand times more numerous, and eeveral species which are merely or mainly shrubs in the drier Sierra, become lordly trees in the moister air of the northerly coast ranges. Through most of California these two Pacific forests are separate. In the northern part of the State they join and form one rich woodland belt, skirting the Pacific, backed hy the Cascade mountains and extending through British Columbia into our Alaska territory.

So we have two forest regions in North America, au Atlantic and a Pacific. They may take these names, for they are dependent upon the oceans which they respectively border. Also we havc an intermediate isolated region or isolated lines of forest, flanked on hoth sides hy bare and arid plaius; plains which on the eastern side may partly he called prairiee, on the westeru, deserts.

This mid-regiou mountain forest is intersected hy a transverse helt of arid and alkaline plateau, or eastward of grassy plain, 100 miles wide from north to south, through which passes the

(Continued on page 135.)

MECHANICAL PROGRESS.

Effects of Forging on the Structure of Iron.

We have formerly alluded to the papers read at a meeting of mechanical engineers at the Paris exposition, by M. Fresca. It seems that this expert has been requested to pursue his subject "the flow of solids" more fully, and his essays are printed in foreign journals. We take therefrom a paragraph concerning the effect of forging: The object of the author's early discussions on the forging of iron was to show the tendency to parallelism of all the fibers which originate in drawing-out under the hammer, and which are separated from the neighboring fibers by a cementing substance derived from the incorporated cinder, which fills up all the void spaces between the fibers. This matter is frequently of a vitreous nature, very rich in oxide of iron, and when it is not burned off or pulverized at the surface of the piece when in the hands of the smith, it follows all the varieties of form to which the piece is shaped in its several parts. It has been shown, nevertheless, that the deformation may be only superficial when the action of the hammer was mild, whilst the influence of a more powerful blow, such as is practiced in industrial operations, may be felt to the core. An oblong piece of iron may then be compared to a bank of parallel threads, which will interlock with each other when it is attempted to draw them out lengthwise, but which will separate in a much less regular manner when they are drawn in the crosswise direction, at the risk of throwing into confusion the regularity of the original arrangement; forming knots and voids which must evidently weaken the power of resistance which would be possessed by the piece under other conditions. This effect is well exemplified by the specimen of a railing bar, in the formation of which a rectangular bar is transformed, in respect of its transverse section, into a number of rectangles and circles regularly distributed, the fibers in the circular parts losing the parallelism which is visible in the rectangular parts. This condition would certainly be critical, were it not that the central part of the enlargement was afterwards to be bored out. The interposition of the friable silicates between the fibers which are more properly metallic, ought to be seriously taken into consideration in this case as in many others. At present a few of the more characteristic facts may be noticed. From the fact that iron wire of good quality is capable of supporting, before giving way, loads much greater than ordinary iron, a manufacturer of best scrap iron tried to work it from piles exclusively composed of wire. A longitudinal section of the bars manufactured in this manner having been oxidized, reveals the filiform structure of the bar much more clearly than any of the specimens of merchant iron. There is exhibited a specimen taken from an old railing at the Conservatoire which broke spontaneously in its place. Having a greater proportion of the silicates in its composition, which had been imperfectly removed in the process of forging, this specimen exactly reproduces an analagous type. On the contrary, when the best Swedish iron is submitted to the same operation it gives but the faintest indications of longitudinal striæ, which sometimes can only be produced by taking special pains with that object.

DRY DOCK WORK.—The *Iron Age* describes some work in dry docking, which it claims is ahead of the usual run. It says that the Inman steamer *City of Chester*, when about 350 miles from New York, had the misfortune to break her propeller so badly as to utterly disable her. It was found upon examination that the boss was broken in two parts. The question of repair was a very serious one, for the *City of Chester* is, if we remember rightly, the third largest vessel afloat. It happened that the Erie Basin was not available, as the repairs and enlargement have not yet been completed. It was therefore necessary to attempt the use of the largest of the East river sectional docks. The vessel, although something more than 100 feet longer than the dock, was successfully put in position, raised, and the substitution of a new propeller accomplished without any delays or difficulties. This is the largest vessel that has ever been raised on a floating dock in this country, and we have heard it said that the feat has never been equaled abroad. Probably the Bermuda floating dock is large enough for the purpose, but we believe it has not yet been tested by a ship of anything like the size of the *City of Chester*. That the dock was taking a very heavy load was made apparent by the unusual depth at which it floated. The repairs were quickly made, and the vessel was ready for sea on Sunday morning at 10 o'clock, having been on the dock from Wednesday morning till Saturday afternoon.

A MASSIVE DRAIN PIPE MACHINE.—Prof. E. V. Gardner lately delivered a lecture in London on "Clay and the Potter." We find therein a description of what is called the plunger drain-pipe making machine. It occupies two floors of a large building, and consists of a steam cylinder 3 feet 6 inches by 4 feet; within the cylinder is a piston. The piston-rod is attached at its lower end to a plunger. This plunger stands over and fits a dough chest. The bottom of the dough chest has a mold attached, which forms the socket of the pipe. At one time the cylindrical portion of the pipe and the socket were made in two distinct operations, and were afterwards luted and joined together. The dough chest is first filled with dough, then the engineer actuates a steam lever when with a mighty blow down comes the plunger, and forces the clay into every crack and cranny of the socket mold. The next motion of the machine removes the socket mold and raises a table to support the pipe in its passage out of the machine. A second blow from the plunger delivers the pipe socket complete, a wire cuts off the pipe to a proper length, and a traveling table removes it from the machine. This machine will turn out from 12 to 50 drain pipes a minute, according to their diameter. Pipes of 18 inch or 2 feet diameter are manufactured at the rate of 40 or 50 an hour.

PEAT MADE INTO CEMENT.—One of the most novel manufactures proposed abroad is that of Mr. J. C. Russel, of London, who makes cement of peat. The peat as cut from the bog is first dried by any suitable means, and broken up or pulped with nearly its own weight of gas tar. The peat or tan, as the case may be, is put into a kettle, and may, if desired, be well mixed with a sufficient quantity of cocoanut fibre, or oakum, or cotton waste, or small twigs, or leather, or bulrushes, or grasses, or any of these together, or any material of a fibrous nature to give the product sufficient tenacity. The mixture is then mixed with either a combination of gas tar, pitch, Stockholm tar, Trinidad pitch, naphtha, benzole, spirit of turpentine, quicklime, hydraulic lime, chalk, pezzuolan, well washed or sifted sharp sand, flint glass in fine powder, any aluminous, calcareous, or silicious minerals or mixtures. Portland or hydraulic cement, iron filings or horiugs, slag, or scoria. The whole mass is well stirred, and heated by means of super-heated steam or otherwise until the materials which are capable of being softened or melted by a low heat that will not destroy the peat or tan, are melted or softened enough to enable the different materials used to become thoroughly mixed together, and the whole mass is finally raised to a temperature of at least 400° Fahrenheit. When used for paving purposes the material is removed from the receptacle in its heated state, and spread over the prepared surface or foundation of the road or other place, and consolidated by means of hot beaters or pressures until it is thoroughly set and even. In making drain pipes, the material in a hot state is transferred to suitable molds or to a drain pipe making machine, and the pipes are made in the usual way of making earthenware pipes or otherwise.

STOWING JUTE TO PREVENT DECAY. — The difficulty of transporting jute from Calcutta to Dundee and other British ports in a satisfactory condition is one which has constantly exercised the minds of those engaged in the trade. The chief cause of the bad state in which much jute reaches this country is what is known as "sweating." The bales are tightly pressed into the holds of the vessels soon after the crop is grown, and with the working on the passage steam rises from them, and, although there are numerous ventilators, these do not prevent a considerable quantity of water collecting in the form of beads on the under side of the upper decks and on the sides of the vessel. The result is that water gets to the jute, and rots it to such an extent that many bales on their arrival are not fit for use. According to the *British Trade Journal*, an admirable arrangement to prevent this destruction of cargo has been introduced in the ship *Morayshire*, one of the Dundee jute fleet: To save time in loading, permanent dunnage has been placed up the side of the ship, and as a space is left between it and the cargo, the water, instead of injuring the cargo, finds its way to the wells. The under side of the deck boards has been laid on an angle, and the result is that the "sweat" is conducted to the sides, and by them to the wells. That this system works well is seen from the state in which the bales were recently put on shore from the *Morayshire*, those that may be said to have been most exposed to danger having turned out without the least damage.

RAILROAD LAMP.—A Connecticut inventor has devised a safety lamp for railroad cars. A kerosene lamp is placed outside the car at one end, throwing its light by a reflector into a tube a foot and a half in diameter, which runs alongside of the ventilating deck. At intervals the tube is "tapped" for light, a system of reflectors distributing the light through the interior of the car. An attachment is provided which extinguishes the light the instant the lamp is off its balance, so that in the event of an accident, it is claimed that no fear of fire need be apprehended. The tube conducts the light so admirably, it is said, that fine print can be read at a distance of 40 feet from the lamp.

PROGRESS OF SHOE-MAKING MACHINERY.—Forty-five millions of pairs of sewed shoes and 55,000,000 of pairs of pegged shoes were made and sold by the manufacturers of the United States in 1877, and 85% of the work done on these shoes was done by machinery. The uppers are cut out by hand, simply because of the variableness of the quality of the leather in the same skin. The soles are cut out by machinery, and the binding, pasting, closing, crimping, stitching, heeling and polishing are all done by machinery, without the aid of human hands.

SCIENTIFIC PROGRESS.

Archæology in the Mississippi Valley.

The *Popular Science Monthly* calls attention to the archæological investigations which are in progress in the "Great American Bottom," lying on the east side of the Mississippi, in Illinois, between Alton on the north and Chester on the south, and having an average width of eight or nine miles. The remains of ancient occupation there abundantly found prove the mound-builders were not blind to the agricultural value of this remarkable tract. It was indeed "one of their greatest seats of empire," in the language of Mr. H. R. Howland, who has published, in the *Bulletin of the Buffalo Society of Natural Sciences*, an account of certain notable archæological researches made in the "American Bottom." The mounds in this tract seem to have been divided into three principal groups: one lying within the limits of East St. Louis; another on the banks of Long lake, 12 miles northward; and the third, one of the most extraordinary groups in this country, between Indian lake and Cahokia creek, some six miles from the Mississippi, and eight miles to the northeast of East St. Louis. In this last group is the great Cahokia mound, by far the most important monument left by the mound-builders. The several groups are connected by lines of mounds at irregular intervals, and the total number is at least 200. Some two or three years ago Mr. Howland, having learned that one of the mounds in the second group was being removed to procure material for road making, repaired to the spot and found the work of destruction already well advanced. In the meantime some interesting discoveries had been made. At the hight of four or five feet above the base of the mound the workmen came upon a considerable deposit of human bones, and on the same level were discovered a number of valuable relics, some wrapped in a sort of matting. This was made of a coarse, cane-like fiber, simply woven without twisting, the flat strands measuring about one-eighth of an inch in width. Among the articles found were several tortoise shells of beaten copper. One of these was about one sixty-fourth of an inch thick, two and one-eighth inches long and thirteen-sixteenths of an inch in hight. This was the largest one of three in the author's possession. Their shape is remarkably true, the workmanship evincing delicate skill. Each tortoise shell appears to have been originally covered with several wrappings; first a woven cloth of vegetable fiber, then a softer, finer fabric of rabbit's hair apparently, next a membranous coating, finally a layer of non-striated muscular fiber, possibly intestine or bladder. Besides these singular objects are two specimens of the lower jaw of the deer, the part which contains the teeth being encased in a thin covering of copper, and the whole wrapped in the same manner as the tortoise shells. Other relics found in the same mound, specimens of handicraft, sea shells from the Gulf of Mexico, etc., give evidence of the high grade of technical skill and the far reaching intercourse of the prehistoric people who, in the long-forgotten past, inhabited the "Great American Bottom."

Examination for Trichina.

We are not aware that the dread trichina has yet been found alive in this State, though no one can tell how soon it may appear. Notes of the best ways to recognize it may be of value to our amateur microscopists. For a first examination under a microscope, use a one-inch objective. Place a fine piece of the muscle in question on a glass slide in a drop of serum, or aqueous humor, or a 1% solution of common salt. Teaze out the fibres and separate them from one another by means of fine needles set in sticks for handles; keep the eye all the while on the work, and watch for the dim outlines of the worm. Perhaps the cyst will appear first; it may be that your manipulations will have torn the cyst and let the worm out. A little dilute hydrochloric acid added when the cyst is once discovered with decalcify it and render the parasite visible through its translucent walls. When the tissue is well displayed by the above means, a thin glass cover should be placed over it; the focusing will be better and the parts more distinct. Judicious pressure on the cover glass may often be made to bring the trichina into view by thinning and displacing the parts under it. It is often an aid to use some staining fluid; Beale's carmine, or the hæmatoxylon fluid. I have have often placed a drop of this fluid at the edge of the cover glass, watching the field while it made its way by capillary attraction among the fibres of the tissue, and have seen the outlines of the parasite come out clearly and distiutly when nothing could be seen before.

The examinatiou by thin sections may be practiced with advantage. If the muscle be carefully dried, very beautiful sections may be made with a sharp razor dipped in dilute alcohol. These may be easily handled with a camel's hair pencil. The thinnest should be placed upon a slide under a cover glass, and may be examined directly in staining fluid or in the salt solution. Excellent sections may be cut from frozen tissue or from tissue soaked for a few weeks in strong alcohol, or in a 10% solution of bichromate of potash.

The Intra-Mercurial Planet.

Of course the discussion of the existence of a planet with an orbit within that of Mercury, begins afresh upon the claim of discovery during the eclipse being advanced by two observers. The following are the records of the discoverers: Prof. J. C. Watson, of Ann Arbor, says: I have the honor to report that at the time of totality I observed a star of the four-and-a-half magnitude in R. A. 8h. 26m. dec. 18 deg. North, which is, I feel convinced, an intra-mercurial planet. I observed with a power of 45, and did not have time to change the power so as to enlarge the disc. There is no known star in the position observed, and I did not see any elongation, such as ought to exist in the case of the comet very near the sun. The appearance of the object observed was that of a ruddy star of the four-and-a-half magnitude. The method which I adopted prevents the possibility of error from wrong circle readings; besides I had memorized the Washington chart of the region, and no such star was marked thereon. By comparison with the neighboring stars on Argelander's scale, the magnitude of the plan would be the fifth, although my direct estimate at the time of the observation was four and a half as stated.

An amateur, Mr. Lewis Swift, of Rochester, N. Y., shares with Prof. Watson, of Ann Arbor, the honor of rediscovering Vulcan, the hypothetical planet of Le Verrier. The independent statements of Mr. Swift and Prof. Watson go far, by their coincidence, to prove the rediscovery. Mr. Swift says the new planet was to the southwest of the sun about three degrees off (a distance, say, about six of the solar diameters) and was of the fifth magnitude. Prof. Watson hooked the same object southwest of the sun, about two and a half degrees distant, and rated its magnitude at four and a half. There is here sufficient difference of data to show no understanding between the two observers to make out a case. In the haste of the work degrees of distance and magnitude could only be guessed at. The agreement of the two men is near enough to establish very strongly the existence of the planet Vulcan, when it is known that no fixed star (visible in the eclipse) occupied either of the assigned positions.

The finding of Vulcan amid such difficulties sheds lustre on American science, which has but lately, in the department of astronomy, won the blue ribbon with the moons of Mars.

HAYDEN'S SURVEY IN THE FIELD.—Dispatches from Washington contain a letter from Prof. F. V. Hayden, in which he gives notes of his field operations. He says: Two divisions of the survey under my charge left Granger station, on the Union Pacific railroad, on July 24; one division, under Mr. Garnett, started northward of the valley of the Green river for the Yellowstone Park, and the other division, under Mr. Clark, for the Teteou district. No information has been received from them. The primary transportation division, under Mr. A. D. Wilson, and the photographic division, under Mr. Jackson, left Point of Rocks station, on the Union Pacific railroad, July 24, and proceeded northward toward the Wind River mountains. Important observations were made of the eclipse of the sun, July 29th. The first primary station has been made on the Wind River peak, and we are near the northern end of the range. We then attempt the ascent of the Grand Teteon. The two parties will then separate. Mr. Wilson goes to Henry's lake to make a primary station, while the party under Mr. Jackson will proceed at once to the Park. We have been eminently successful so far in every undertaking, and have secured much valuable information. We have no trouble from Indians. Some of the Bannocks are now camped, fishing and hunting, within a few miles of us, but most of them have just returned to their reservation near Fort Hall. They are understood to be perfectly peaceable. It is not probable there will be another opportunity to communicate with the Department before some time in September, when we reach Monmouth Hot springs, in the National Park.

ELECTROSCOPE OF SILK.—M. Rameaux has recently exhibited before the Societe de Sciences of Nancy a simple and sensitive electroscope. It consists of a fine fiber of white silk, fixed at one end by means of a little wax to any support, and free to oscillate in any direction under its point of attachment. A single thread would, of course, suffice for the ordinary purposes of electroscopy properly so called, but it is preferable to employ two near each other, taking care to space them so that they cannot foul each other during their swing, or influence each other reciprocally. One of the threads is charged by means of a glass rod with positive electricity. Everybody who attracts one of the threads so charged and repels the other is necessarily electrified. The other is charged by means of a stick of resin with negative electricity. Its electricity is of the same sign as that of the thread which it repels. The sensibility of these electroscopes is greater within certain limits as the threads are made finer, longer and less conducting.

ANTIMONY IN BATTERIES.—Mr. R. J. Nunn calls the attention of electricians to the use of antimony as a negative element to replace carbon in some galvanic batteries where sulphuric acid is used as the exciting fluid. He mentions among its advantages its cheapness, the absence of scaling and disintegration, and the fact that galvanization begins almost immediately on immersion.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Bunker Hill.—*Ledger*, Aug. 24: Looks well. Last run averaged $17. Ore in sight to run 10-stamp mill two years. Shaft sinking satisfactorily; 50 feet out the 100 finished.

Gover.—Quantity and quality of ore improved. New shaft down 815 feet; three-foot ledge of excellent rock at bottom. In other portions of the mine the ore is seven feet and over, in width. As with other mines of the county, the ledge has shown signs of pinching out only to expand again with good promise.

Items.—H. Reese, present owner of the Hercules mine near New Chicago, will proceed at once to develope it. The old Philadelphia mine's 20-stamp mill is being put up at the Centennial. Dr. Folsom, who is to introduce the Willard roasting furnace, will shortly open an assaying office in Jackson. Work resumed on the Moore mine; powerful hoisting works and a small mill are to be put up. Steam power may soon avoid all difficulties from an intermittent water supply at the Lincoln mine. Nearly 100 Chinamen are employed at the Carbondale coal mine. Since the 20th the quartz mills from Jackson to Drytown have been idle owing to a break in the ditch. The Oneida discharged this week 10 or 12 miners. The last Montirichard clean-up yielded above the previous run.

CALAVERAS.

Hydraulics.—*Chronicle*, Aug. 24: The water supply has failed and all the claims are making final clean-ups. This is a disappointment, for last winter was a comparatively wet one, and it was thought the placers might he run well into September.

Whisky Slide.—The contract recently let for sinking the shaft at the Whisky Slide mine, Jesus Maria district, is finished and the work of crosscutting the ledge was commenced last Tuesday. The shaft is now 130 feet deep. At that point the ledge shows splendidly. The vein is about six feet in width, all milling ore. A fair proportion of the rock carries free gold visible to the naked eye.

Items.—Pumping is prosecuted energetically at the Banner. The Sundermier mine, at Independence has sent to San Francisco 500 pounds of quartz specimens.

INYO.

General Outlook.—*Independent*, Aug. 17: There is greater inquiry for mining prospects and more new discoveries weekly reported than at any time for years past. Old districts are producing new ledges of excellent prospect. The new Byrnes discovery has drawn many towards Deep Springs. Capt. Endy is taking out rich gold ore from new openings on the Eclipse The old Waucoba mines, in new hands, promise well. Old mines and new discoveries near Swansea will aid that region. Everything on Kearsarge hill and in Alabama is on a more solid basis than ever before.

MONO.

Bodie District.—Every week the report from this district is most glowing. Prospectors and influential mining men are arriving every day. New claims are being located. "From the Blackhawk on the north to the Sigourney on the south, the hills are fairly alive with miners." Each issue of the Bodie *Standard* contains reports from mines almost numberless. So many of them are there that it is impossible to notice all even with hare mention. This week the Blackhawk with its handsome strike of a 3-foot ledge (propably a fissure vein) of high-grade ore; the Standard in which an incline has followed the ledge to a depth of 800 feet, and now finds assays at the bottom averaging $125; and the Booker, with its excellent prospects, have received the lion's share of notice this week. Those that have established an undeniable reputation do not require mention as much as others that are struggling upward. We try to give each its turn.

Syndicate Tunnel.—The main tunnel is in 1651 feet, the face in hard porphyry formation. The ground works better than for a month past, The East crosscut is in 360 feet, face also in porphyry. Both main and cross have cut quartz veins.

White Cloud.—Work resumed. Combined with the Red Cloud on the south, the company is running a shaft on the line. It is 30 feet down, and a 10-inch ore stratum is running in the bottom.

University.—Shaft, 60 feet. Ledge, 3 feet. Ore from the 18-foot drift is being worked in an arastra. About three tons extracted daily.

Alabama.—Prospects of a good ledge. Shaft 65 feet. Will go 50 feet deeper.

May Belle.—An incline is to follow the ledge down 220 feet. Decomposed quartz and clay in the bottom of the incline.

Concordia—This claim is parallel to the Red Cloud and 400 feet west. Promising 2-foot ledge seems inclined to widen. The shaft will go 100 feet deeper.

Ray of Hope. This is the first north extension of the Sigourney. It was located by Isaac Misamore. Shaft, 20 feet; formation, favorable.

Other Mines.—The shaft in the Express is down 70 feet; the bottom drift is in 25 feet; the ledge is very small.—Eighty feet down on the Imperial shaft a 3-foot ledge was struck, but a cave necessitates a new shaft, which will be sunk at once. The Humboldt shaft, already down 45 feet, will be continued as soon as timbering is finished.—The Rustler shaft is 32 feet deep, the ledge 10 to 14 inches wide, pitching east.—The Dale ledge is about 1 foot wide, and promises to widen; the shaft is down 11 feet.—The Sunbeam owned by S. E. Curria and G. Menz is a new location, and work has but just commenced.—The South Burgess shaft is down 70 feet, and the owners are enthusiastic.—The Niagara has but just commenced.—The Buffalo shaft is down 25 feet.—The Hylridge shaft, down 15 feet, is meeting with strata. The Little Rock shaft, down 10 feet, is reported in excellent condition.

Dog Town Placers.—For a long time very little work has been done on these placer diggings, but with the revival of prospecting in this section, parties are again turning their attention to placer digging and there are now about 20 men at work. The diggings cover several thousand acres and are said to turn out handsomely. Heretofore the great scarcity of water has been the drawback to their development, but there seems to be no doubt that an immense volume can be brought from the lakes in the mountains, a distance of perhaps three-fourths of a mile, to Greene river, and from there of course follows a natural channel to the claims. Some think water, at a very small outlay, could he brought from Twin lakes.

NEVADA.

Swiss-American Company.—Grass Valley *Union*, Aug. 25: This new organization of San Francisco capitalists will work on the western portion of New York hill, on the old Victor and Emmet ground. It is near the late rich discoveries on that favored hill. The claim is 1,900 feet in length, and is bounded on the west by the New Rocky Bar, on the south by the Ford & McDonald, on the southwest by the Grass Valley or Bobby Smith claim, and on the north by the Black Lead. It will be seen from this, to those who are familiar with the claims in that part of the district, that the Swiss-American is most favorably located. Nothing of a systematic character has yet been done on this ground, the owners not being prepared to put up necessary machinery. The ground has been long held by working miners and more or less work has been done upon it, but nothing of a systematic character. The deepest shaft has been sunk to a depth of only 40 feet, and the crushings of rock have paid from $10 to $45 per load. It has also produced some very rich specimens. The ledge at the bottom of the 40-foot shaft shows a strong two-foot ledge. It is believed that this ledge is the same as that in adjoining ground, or the same system of ledges which are rich gold bearing that are found so near together there. A perpendicular shaft will be sunk 125 or 150 feet, then a crosscut made to the ledge. The shaft will be on the western part of the hill, about 400 feet west of the Ford & McDonald shaft and east of the road leading to the old North Star mine. The Phenix hoisting machinery has been bought and is expected to be in running order in from two to three weeks. Thomas Cracklin is Superintendent.

Items.—In the Derbec mine, 55 tons of gravel gave from 80 out of about 600 feet of boxes a yield of at least $13.50 to the ton. The Belle or Green Emigrant claim, near Auburn, has lately cleaned up over $11,000. The ledge in the Brunswick drift of the New England mine is four feet thick and heavily sulphuretted. The Last Chance mine, near Omega, is about to be worked. The new air drills at the Murchie work well; the incline goes down rapidly; the new battery will crush about 30 tons per day. The Live Oak company are applying for a U. S. patent to their quartz claim in the south end of Grass Valley township. John Van Martin, Cleveland and others have struck favorable gravel in their Round mountain tunnel.

PLACER.

You Bet.—Dutch Flat *Forum*, Aug. 22: The mines are all running here yet, with favorable results. A blast of 800 kegs of powder was exploded in the Brown's Hill claim, which did all that could he expected. The Waloopa is running yet and paying very well. The Nevada company have three claims running yet, all of which are panning out splendidly. The Hussey claim is running and paying first-rate.

Greenwood.—*Herald*, Aug. 24: Frank San Francisco, A. Lee and another prospector, recently struck near Greenwood a ledge so rich that they have been able to make from $20 to $30 per day by crushing and panning out the decomposed rock. Besides this, they have ready some milling ore that may reach into the hundreds.

Items.—The Hayward mines at Chalk Bluff are still running. L. Moore, J. Hughes, Dr. Dozier, and another prospector, have struck in Ophir district a ledge that assays over $1,000 to the ton.

SHASTA.

Copper City.—*Reading Independent*, Aug. 22: It is thought that the Northern Light has very good prospects. At last accounts the winter cave of the bank and tunnel had not yet been cleared away; but work with that end in view was vigorously progressing. There is said to be sufficient ore in sight to justify the building of a mill. The company are now constructing a wagon road from their mill to Copper City, and as soon as completed they intend to haul down and have 100 tons crushed in the Extra company's mill. The other mines of the district are producing ore in most cases equal to that of the Northern Light, and have all good ledges.

SIERRA.

Items.—Downieville *Messenger* Aug. 24: Manson & Archambault are getting the machinery fixed at the Pliocene mine preparatory to sinking. They will put in a steam pump capable of throwing at least 80 inches of water, and with its help there is no doubt of their being able to keep the shaft clear. The pump was formerly used at the Independence mine. The York brothers have contracted to prospect in the river below Downieville for a silver ledge supposed to cross the stream somewhere there. Mr. Benham, superintendent of the Oriental quartz mine and others have relocated the Oak Flat claim, purchased the mill and will develop the property. The Sierra Buttes company are taking out good milling ore from the Independence ground.

SISKIYOU.

Empire Mine.—Yreka *Union*, Aug. 24: The new mill superintendent Mr. Ferguson has arrived, the flume and ditch are completed, and it is hoped that a start will soon be made. This mine is being opened by citizens, who, knowing little themselves about quartz mining have engaged competent men. The interests of the county will rise or fall according as this enterprise proves to be success or failure.

Hamburg Bar.—Encouraging news comes from this region. The last winter slide in the McCrary and Marten claim has been away, the channel has been reached and large quantities of dust are being taken out. Below this claim, on McCrary Bros.' claim, last year's tailings are being washed, yielding $100 per day. These tailings are exposed to the air for this great length of time and to soften them in a measure. In Mr. W. B. Morgan's claim, below Hamburg, but in the same channel, over $900 was taken out last week. Kittlewood & Co., who have the large claim in the river, above Hamburg have got their derrick in.

Items.—A rich quartz ledge has been struck in the Pacific mine. Cornish & Co. will soon finish their crushing and clean up. Warren & Nesbit have already cleaned up and will start their mill on rock from another ledge.

TUOLUMNE.

Philadelphia Gravel Mine.—*Independent*, Aug. 17: This mine is 13 miles northeast from Columbia, between the middle and south forks of the Stanislaus. It covers 600 acres, of which over two-thirds is gravel. A brief supply of water was obtained from Rose creek, and with one "giant" five-inch nozzle, under 200 feet pressure, eight men in 29 days secured $4,150. Now they have no water and are preparing to obtain a permanent supply, either from the middle fork or from the reservoirs on the south fork. When the water comes they will double forces for perpetual work.

Items.—Jones and Woodman, *alias* Star mine, is in a dry and lonesome place just now. Riverside mine, with 20 men and 20 stamps, all busy, does more than pay expenses while it drives its tunnel in from the level of the mill site. The Evans mine, with one arastra, makes money while it pushes its drifting. The Garrote gravel mines have suspended operations for the present, and work will hereafter start in at another point. In the meantime the company are disposing of the water from their ditch to the other mining companies in that section. Phelps, Shepard & Cowie have taken down and broken up the "giant crusher" on the Alahama claim, and have removed it to the foundry to he melted over for other uses. O. Cowan is hauling rock to his mill on Brown's Flat from the Jack Barry claim near Dragoon gulch. The ore improves as sinking progresses.

NEAVDA.

WASHOE DISTRICT.

Con. Virginia.—Gold Hill *News*, Aug. 28: The daily yield of ore has been reduced to 145 tons. This was owing first to the intense heat on the lower levels, and secondly to a delay of 48 hours in the hoisting caused by the breakage of the pump rod at the C. & C. shaft. There is no change worth noting of any of the ore-producing sections of the mine. At the C. & C. shaft the 2050 station is in, and the shaft is being sunk rapidly to make a sump. As soon as that is completed a drift will be started to the westward to connect with winze No. 3 for the purpose of opening and ventilating the 2050 level. The joint east crosscut from the Best & Belcher joint winze is making steady progress, streaks of quartz showing occasionally in the face. On the 1850 level a new winze (No. 3) has been started downward to connect with west crosscut No. 2 on the 1950 level for air purposes. Winze No. 3 below the 1750 level continues downward in excellent ore. This winze was started upon a streak of ore but a few inches wide, which has gradually widened until the full size of the winze is now in good ore. The south drift on the 1300 level has been retimbered for a distance of 370 feet.

Sierra Nevada.—The hoisting reels and other necessary machinery at the head of the south winze, below the 1700 level, is in place and works splendidly. Enlarging the winze so as to make another working compartment is also making good progress. Sinking the winze below the 2100 level was interfered with to some extent during the week, but is again making fair speed, the bottom still scalping the quartz and ore vein, with every indication still of the most favorable character.

Lady Washington Con.—The north drift on the 1300 level is still advancing, the face in vein matter and quartz.

Julia Con.—A most important and, to Julia stockholders, valuable contract and compromise has been made with the Sutro tunnel company. By the terms of this contract the tunnel company are to complete and connect with the Julia shaft at the earliest day possible a south branch of their tunnel which will serve the double purpose of a drain and working tunnel for the conveyance of timbers and supplies. Work on this branch tunnel is to be prosecuted from both ends, and has already been commenced on the tunnel side. As soon as the tunnel reaches the Julia shaft, the shaft will be doubled in size and be used for the hoisting and lowering of supplies through the tunnel, a depot being established for that purpose. For the privilege of the drain the Julia company is to pay $100,000; and for each foot of tunnel run from the Julia side the company is to receive back $70. Not the least important feature of the contract is that the Sutro tunnel company release all claim to that portion of the Julia claim lying within the limits of the Sutro corporation, and liable to dispute by them. Taken all together it is most certainly a splendid bargain for the Julia. The main south drift on the 2000 level has been cleaned out and repaired to a few feet beyond the junction of crosscut No. 2. Crosscut No. 1 on the 2000 level has been cleaned out and repaired to the face, and is being again driven forward as fast as the intense heat of the level will permit. The face has already cut some very fine quartz and ore, but not yet reached the point at which it is expected to cut the best ore.

Lady Bryan.—Good work has been done in freeing the shaft from the water which has for so many months submerged the mine from the bottom of the shaft up to the 250 level. The water is sufficiently reduced to allow of the old upper drifts being cleaned out and the investigation of the ore merits of the mine being resumed. The shaft is 600 feet deep, but the last station opened before work was suspended, was at the 500 level. This new shaft was commenced nearly five years ago, and openings made from it into the old mine at the 80, 170, 250 and 380 levels respectively. Merely the incline from the old workings was found to have penetrated to that depth, all the drifts and other explorations being above that point. The mine has been extensively worked in years past on the three upper levels mentioned, and although a large amount of good paying ore has been extracted therefrom, thousands of tons yet remain which can be extracted and worked with good profit. Some very rich spots and bunches of ore were formerly found on the 80 level, of the green chloride character, with a considerable amount of free gold. On the 170 level the ledge commences changing to the regular white Comstock character, and silver predominates. The ledge is a very large one, and on the 380 level lateral drifts were run 700 feet south, and 250 feet north from the shaft, following the east wall, and some little crosscutting was done. The ledge was found to be all quartz, and considerable ore of a fair grade was met with, but as further exploration and development could not be conducted to advantage, all work was stopped until the present new pumping and hoisting machinery could be brought to bear in the case.

Savage.—Owing to an accident which prevented the Savage and Hale & Norcross pumping machinery from working in concert during the first part of the week, the water gradually rose in the main shaft to within a few feet of the 2000 station. Yesterday morning, however, the pumps were again working in unison, and to-day the water is being again rapidly lowered.

Sutro Tunnel.—Total length 20,473 feet. The header is making good progress, and rapidly nearing the west wall of the Comstock ore belt. Definite and satisfactory arrangements having been made with the Julia Mining Company, fully recognizing and acquiescing in the claims of the Sutro Tunnel Company, a branch tunnel south was commenced day before yesterday, which is intended to connect with the Julia mine, and continue south to Gold Hill. This south lateral branch will he the full size of the main tunnel—ten feet wide by eight feet high—and its point of commencement is 19,715 feet from the mouth or entrance of the tunnel. The distance through the branch from the main tunnel to the Julia shaft is just 1,400 feet, and as work is also to be commenced from the shaft, it is calculated that the branch will be completed to that point, and connection made by the first of December. Meanwhile a large ditch or conductor for water is to be constructed throughout the entire length of the Sutro Tunnel, as well as the branch, of sufficient capacity to carry all the water which may he pumped or discharged into it from the Julia or other mines of the Comstock. As this water will he hot, the drain will he carefully covered throughout, in order to prevent the heat and steam from it rotting the timbering or heating the air of the tunnel.

California.—The average yield of ore was lessened for the week by the stoppage of 48 hours, caused by a breakage of the pump rod at the C. & C. shaft. That has been repaired, however, and the average daily extraction of about 200 tons of ore per day resumed. At the C. & C. Shaft the water rose rapidly when the pumps gave out, but has been drained and the sinking resumed. This shaft is now down ten feet below the 2,050 station, and will he continued down twenty feet further to form a sump before commencing to drift on the 2,050 level. The joint Ophir winze below the 1,950 level has reached the 2,000 level, at which point preparations are being made to start a south main lateral working drift, designed to connect

with the C. & C. shaft, and form a working base for the opening up of the mine to that depth.

OPHIR.—The south winze below the 1900 level has reached the 2000 level, and will now be connected with the south drift on that level for air purposes. As soon as that is done, it is the intention to continue this south drift directly through the California ground to the C. & C. shaft, forming a working base for the development of the entire levels of both mines. A tank and pump station is being cut out at the 2100 station. Retimbering the main shaft above the 1465 level is making steady progress, the repairs being conducted in such a manner as not to interfere with the use of the shaft.

UNION CON.—The north drift on the 1600 level is being steadily advanced, the face in soft prophyry, mixed with quaatz and clay. It is now in a distaunce of 617 feet. It is still uccessary to keep men at work retimbering portions of the drift where the swelling ground has crushed in the timbers. The chamber for the winze at the east end of the joint crosscut, on the south line on the 1600 level is nearly completed.

YELLOW JACKET. On the 2400 level the south drift is in 205 feet from the winze. The face of this drift continues in dry and fair working material, consisting of porphyry, with seams of quartz. The new shaft is down 1721 feet, The bottom is somewhat harder material, and continuing dry. It is calculated that about 100 feet will be made in siuking the shaft during the present month of August.

ORIGINAL KEYSTONE.—Sinking the maiu working shaft has made excellent progress siuce last weekly report, the rock working well and the influx of water remaining about the same. In the prospecting shaft at the north end of the mine a station is being opened and 16 feet of drift has been run in hard blasting rock since last Saturday. In softer material to-day. The erection of the building for the hoisting works will be commenced at once, all the requisite lumber being now on the ground.

SOLID SILVER.—The main tuunel or adit of this mine has recently been repaired, retimbered and put in complete order throughout, preparatory to commencing the extraction of ore from the winze below the tunnel level. This winze has been sunk near the fine ore chimney developed about 1100 feet from the mouth of the tunnel, and is 100 feet in depth. At the bottom it ent into a body of excellent pay ore, and it is now proposed to extract and mill the same.

LEVIATHAN.—On the 750 level the two lateral drifts north aud south are pushing ahead, running in the black dyke foot-wall formation underlying the west side of the ore vein. Streaks and bunches of ore giving good assays, and evidently offshoot or feeders from the vein, are frequently passed through iu both drifts, the the north drift showing the best in this respect.

BULLION.—The west drift on the 2000 level is steadily advancing, the face in hard ground, interspersed with slips of clay and small seams of quartz. There is a light seepage of water coming in, which creates a hot steam, making the progress slow and tedious. The east crosscut on the 1700 level is making steady progress, the face iu porphyry carrying streaks of quartz of a favorable character. Siuking the main incline is making excellent progress, the entire bottom in quartz of a fine, healthy character.

UTAH.—Sinking the main incline below the 1150 level is making the best of progress. It is now down 105 feet on the slope. The uprise conneeting with the perpendicular shaft is being enlarged and the chutes put in. The hoisting engines and other machinery are all in place and work finely. The bottom of the incline is in a lively character of vein matter.

CALEDONIA.—The south drift on the 1400 level is being pushed vigorously forward, the face in soft porphyry carrying streaks of lively, healthy looking quartz. There is still a considerable quantity of water in the bottom of the joint winze on the Overman line.

MEXICAN.—Excavating the chamber for the winze below the 1600 level in the joint east drift on the Union Con. line is making steady progress. The joint east crosscut on the Ophir line is being pushed ahead with the usual vigor, the face in hard blasting porphyry. It is now in a distance of 248 feet. The heat in both drifts is very great.

WARD.—The plans and specifications for hoisting and pumping machinery, second to none on the Comstock in power and utility, are being drawn, which machinery will he erected at the earliest day possible.

GOULD & CURRY.—Sinking the main incline is going slowly forward, the ground being hard and the heat intenso. The joint east crosscut on the Savage line is advancing, the face in vein porphyry streaked with quartz.

NORTH CON. VIRGINIA.—Sinking the main shait is making good progress, considering the hard character of the rock penetrated. The rate of progress is about 2½ feet per day. The flow of water is quite strong hut is easily handled by the pumps.

CONSOLIDATED DORADO.—Sinking the shaft is going forward vigorously and good progress is being made in sinking and timbering. Everything is in good working shape, and the development of the mine making steady headway.

JUSTICE.—The quartz and ore in the bottom of the winze below the 1300 level continues to snow a steady and favorable improvement, the streaks of ore encountered being wider and of a richer quality. The upraise from this level is also in good quartz and ore. Sinking the winze below the 1225 level to connect with the upraise is making the best of speed.

TROJAN.—The quartz in the face of the south drift at the fourth station level continues to improve, some of the assays running as high as $75 per ton. It is in a distance of 384 feet. The car samples from this station have averaged $41 per ton for the past week.

CROWN POINT.—The north drift on the 2300 level is being pushed vigorously ahead, the face in rock of a harder character than any that has heretofore been encountered. It is now in a distance of 298 feet. The two west crosscuts on the 500 level have been stopped, and two east crosscuts, directly opposite the west drifts, have been started, both of which are advancing in fine vein matter.

SILVER HILL.—Siuking the main incline is going ahead at the rate of two and a half feet per day, the rock in the bottom blasting out well and the flow of water giving but little trouble. The east crosscut from the main south drift on the 800 level is in fine quartz, which may change to paying ore at almost any moment.

BELCHER.—The breakage of the pump rod has been repaired and everything is again ready to start up. During the past week it has been necessary to pass the water through the 1600 level to the Overman shaft, through which it is taken to the surface.

CHOLLAR COMBINATION SHAFT.—Work was progressing finely both at the pump station and in the drift running to connect with the Sutro until two days ago, when a cog was broken in one of the driving wheels, which caused a breakage of the sole plate of the engine. It will probably take seven or eight days yet to repair the damage.

ALPHA.—Another west crosscut has been started at a point 150 feet south of the north line of the mine on the 2400 level, the face of which is in quartz and vein matter of a very favorable character.

HALE & NORCROSS.—The pumping machinery is all again in good repair and is working splendidly, lowering the water as rapidly as it is possible for it to be accomplished.

MORNING STAR.—Cleaning out aud repairing the main tunnel is going vigorously forward, in order to reach and prospect the ore vein at the point where the tunnel was stopped several months since.

CHERRY CREEK DISTRICT.

STAR.—*Territorial Enterprise*, Aug. 23: At Cherry Creek the Star is the principal mine. It has first-class hoisting works, and Burleigh drills are used in the underground operations. The company have a fine 20-stamp mill, and are taking out bullion at the rate of about $50,000 per month. The lead is from five to eight feet in width and the ore is somewhat refractory, requiring to be roasted. Their lowest working level is 360 feet below the surface, hut they have just reached the 460 level, and are now taking it out preparatory to extracting ore. The same good quality of ore is found at this depth that was obtained from the workings above. The total yield of the mine thus far has been between $400,000 and $500,000. There are several other very promising mines in the district, among which may he named the Mary Ann, Flagstaff and Pacific. The towu contains a population of about 500 souls. There are no idle men in the camp. The Star mining company, at their mine and mill, give employment to about 75 men. The Star will uudoubtedly prove a permanent mine.

NYE.

GOOD REPORT.—*Eureka Sentinel*, Aug. 21: State Mineralogist Whitehill is on his annual round to the mining districts of eastern Nevada. He has made a thorough examination of the mining outlook of Nye county, and states that it was never so bright as it is to-day. He devoted some days to the Carhonate Point region, which he pronounces hardly second to Eureka in point of mineral wealth. The Alexander mine, at Grantville, owned hy San Pedro & Co., bids fair, he says, to become one of the greatest mining properties in the State. There is more ore in sight in this mine than was ever disclosed on a single level in Con. Virginia or California. The ledge is 150 feet in width in places, and never goes below 60 feet. It carries millions of tons of ore worth from $30 to $40 to the ton, and interspersed through this immense mass are streaks of chloride ore which goes much higher. At Downieville there is also another fine property, owned hy the Downey Bros. One furnace is being operated with flattering results. The large new mill in the same section will he completed and ready for service within 60 days. Mining matters at Belmont have lately received a fresh impetus. The Old Belmont mine is looking hetter than for years, while the Highbridge Con., under the new management, is coming to the front with some rich developments. This latter property is to he worked on an extensive scale, giving employment to a large number of men, aud adding materially to the general prosperity of the town and county. The mines of the Tybo Con. company, at Tybo, are likewise looking and yielding splendidly. There has been a marked improvement in this property recently, and increased bullion shipments are confidently predicted. The mill of the company has just been started up, the mine yielding large quantities of ore that may ho successfully treated by tho amalgamating proccss. Good reports are also received from Reveille and Danville districts. On the whole, Mr. Whitehill is disposed to view the general revival of the mining interests of Nye county as establishing heyond question the prosperity of that section of the State for years to come.

NEVADA ITEMS.—The Sherman mine of Pyramid has just struck a very rich streak of ore. It is reported that the Jones & Kinkead company are soon to build a mill of their own. They are about to contract for a tuunel about 1,000 feet long, from the main ravine to strike the ledge several hundred feet below the surface. The Crown Prince tunnel will strike the ledge 450 feet below the surface. The mine is a promising one. The new mill site is surveyed. The Jenny A. mining company, at Hamilton, will not build a furnace this year, but will continue to prospect. Superiutendent Wermuth reports strong indications of oro in the Hoosac at the bottom of the shaft, now about 200 feet deep. The Oreana furnaces have been thoroughly repaired and will be run on Montezuma & Pearl Gold and Silver mining company's ore. Work has been resumed on the Red Deer mine in Mt. Rose district. The two and a half to three and a half foot vein on the lower level of the Fairmount grows richer and richer in antimonial sulphuret ore. Rich oro is coming from the Rescue mine, Silverado. The Leopard mill runs to its full capacity on Leopard oro. Shaft sinking progresses rapidly. In the Hussey mine the usual quautity of first-class ore is being taken from the stopes in the 120 and 230-foot levels. A promising strike was made August 17th, in the Connolly mine. It is the best showing tho mine has had for some time. Krenkle's copper mine, in Harmony District, is to be opened. Samples has assayed from 25% to 40% copper. The Mountain Bride mine sends large quantities of ore to the Auburn mill at Reno. Operations under the new management have commenced in the Highbridge mine. Rich copper prospects are reported south of the railroad, some 60 miles from Toano. Nine hundred dollar-ore has been found in the old Burke mine. J. B. McGee has been appointed Superintendent of the Day mine. Garrison and Riepe will work the mine in Silver King District which they recently purchased for $1,500 from John Heuss. Mining matters in Lincoln county begin to look more cheerful. The Hillside machinery is nearly set up.

MONTANA.

DEWEY'S FLAT.—*New North-West*, Aug. 16: Dewey's arrastra is running on Argyle ore, and Allen Hays' on Argyle float rock. The Monroe Co's mill is not running, but some ten or a dozen men are at work in the mine and taking out good ore. Milo French is foreman of the mine. Legatt & Co. are working four men sinking on the Argyle. They have over 200 tons of good ore on the dump. A. M. Madison is sinking on the Greeley—mine looking well. Dewey & Co. employ four men on the Argyle. Spurr & Mansfield are taking good ore out of their mine. Several men are making money gathering float on Quartz Hill.

MONTANA ITEMS.—The Alice M. Co., at Butte, is adding another five stamp battery to the mill, and is puttiug up two furnaces, each of daily fifteen tons capacity. The additions completed more men will he worked. Work on the La Platta ten stamp mill progresses favorably. Wilson, Lavally and McDennett are putting up a ten stamp mill about a mile above the La Platta mill. Wm. Wilson runs the Davis arastra on Gonion ore. Other mills in Butte are being huilt; so this county will have more than double its reducing capacity this year. The Sallie Belle mine, Red Mountain, has struck the lead 125 feet below the surface, the end of a 320 foot tunnel. The ore is as rich as that at the surface. The new silver Bow mill, with fifteen stamps and room for twenty, will probably make its first run early in October. W. A. Clark aud John Noyes have had surveys made for a ditch from near the head of Buffalo gulch to a 20,000 gallon reservoir to be constructed just below the Acquisition hoisting works. Ed. Barton has struck a honanza on Silver Creek. James Embody's Bisser lode has an eight foot crevice and $500 ore. James Sullivan who is working a placer claim ou Bonlder Bar has picked up in his sluices two nuggets, one $60, the other $80. Prospecting for quartz ledges has been lively in Montana this season.

News in Brief.

REVOLUTION is threatened in New Grenada.

A WORM is destroying the turuips in Kildare, Ireland.

A GREEK has attempted to assassinate General Todleben.

THE silver mine at Ikuno, Japan, has entirely petered out.

HOP-PICKERS are wanted in the vicinity of Healdsburg.

ONE thonsand Philadelphia iron mills men have struck.

THE San Jose gas company furnish gas at $1.50 per 1,000 feet.

OREGON grain this year will average 62 to 63 pounds to the hushel.

THE fare from Bodie to San Francisco hy the Sonora stage is reduced to $26.

THE Masonic Savings and Loan Bank of San Francisco has failed.

EXTENSIVE canneries of halihnt have been established on the Straits of Fuca.

THE coal production of China has already reached 3,000,000 tons annually.

THE army worms have disappeared from the Central Colony, in Fresno county.

SONOMA and Marin potato crops are thought to promise a good yield.

THE Mikado has opened the new buildings of the Tokio Engineering College.

FIRST-CLASS carpenters at $3 per day are wanted at the New Almaden mines.

THE Moore murder trial cost Ventura county about $8,000.

HELENA capitalists will build a tramway around the falls of the Missouri.

A NEW Russian 5% loan of 300,000,000 roubles, issue price 93 cents, is announced.

EACH offeuse of smoothing, cuttiug or boring silver dollars will requiro $1,000 fine.

THE wool clip of Josephine county, Oregon, will amount to 25,000 pounds this year.

A BLACK bug is destroying the potato crop in the vicinity of Prescott, Arizona.

ON August 26th ground was broken for the south lateral drift of the Sutro tunnel.

J. L. SMITH, of Louisville, claims to have discovered a new element, "mosandrum."

THE total product of Mexican mines from 1535 to 1877, is estimated at $4,067,119,321.

IT is estimated that property in Bodie has increased 50% in value in the last three months.

SILVER has been discovered eight miles north of Colorado City. The ore assays $65 per ton.

A HUMAN body ticketed from the planet Mars, has been found in an aerolite from Peru.

GLASS blowers in Wheeling, W. Va., have struck because a man withdrawing from their Uniou is not discharged.

A RAILROAD party is now surveying a route from Benton toward the Snoqualomie Pass, Washington Ter.

A BREAD-FRUIT tree has been acclimated in the State Capitol grounds at Sacramento, and is now in healthy bearing.

PREPARATIONS are being made for the four-day National Soldiers' Re-union at Marietta, Ohio, beginning September 3d.

AT the University of Oregon free tuition is given one student from each county and one for each member of the Legislature.

A LARGE carp pond is in the course of construction on L. D. Latimer's ranch, two miles east of Windsor, Sonoma county.

AUSTRO-HUNGARY may export this year: Wheat, 13,000,000 quintals; rye, 2,500,000; barley, 4,000,000; oats, 3,000,000.

DEER slaughtering is progressing at such a rate in the northern counties of California as to threaten the extinction of the species.

WORK has been unexpectedly suspended for a time on the great Brooklyn bridge. Causo, failure of the two cities to provide funds.

A MAN named Shepplar and his "pard" have struck an immensely rich gold quartz ledge on Dog creek. The ledge is four feet wide.

TURKEY wants England to accept the Cyprian revenue as security for a loan with which to carry on reform.

FOR a long time the temperature in the face drill holes of the Sutro tunnel has been 110°. The stratum is about 1,000 to 1,600 feet deep.

DURING the past year the United States Land Department of California surveyed 157 miles, containing about 3,240 acres, making 381 maps.

INFORMATION with regard to pre-emptible land in northern California can he obtained at the Humboldt, Shasta and Susanville Land Offices.

THE bullion product of the Black Hills for the year 1877, was nearly $4,000,000, and will not fall short of $8,000,000 for the present year.

THE recovery in trade is generally satisfactory, although several commercial centers, notably Manchester and Glasgow, still complain.

IT is reported from Deadwood, D. T., that the California company have purchased the Old Ahe, Palmetto and American Flag mines, adjoiuing the Homestead.

AT Negaunee, Mich., the works of the Miners' Powder Company exploded Aug. 22, doing terrihle execution upon buildings, feuces, glass and trees, and killing five men.

DURING the week ending Augnst 20th, 54,976 pounds of snlphur and 36,360 ponnds of quicksilver were shipped from Calistoga to San Francisco.

BIAGGIO GUERRERO has struck a ledge in the Columhia mine, near Wells-Fargo, at a point 110 feet from the surface, which assays from $12 to $19.

GORHAM BLAKE, of Boston, has seven ledges containing pay rock in Georgia. He has lately visited this coast to study improvements in mining.

AN artesian well on the Norris ranch, Sacramento county, is now down 1987 feet, and the stratum of soapstone which has already been hored through 400 feet, still continues.

AT the annual meeting of the shareholders of the Swiss Mining Company, the following officers were elected: N. Giamboni, president; A. Decourtieux, treasnrer; A. Sbarboro, secretary.

A CONGRESS of Industry and Commerce met August 20th, the President of the Paris Chamber of Commerce heing Chairman. Delegates from England, the Uuited States, Belgium aud Russia wero appointed Presidents.

BRITISH wreck register for year ending June 30th, 1877, reports: Wrecks and collisions, involving total loss, 511; involving partial loss, 3,653. The average for the past 10 years has been 2,417 vessels.

HENRY JOHNSON thinks he has found a meteorite. It will weigh at least 1,800 pounds, is of a dark gray color, ohlong shape, aud is smooth and rounded like a honlder. Location, five and a half miles north of Virginia City.

ON August 22d, Capt. W. E. Jndd, foreman of the Keystone mine, foll 65 feet to the bottom of the mine and sustained injuries from which he has since died. The careless connection between the cable and the lowering tub cansed the accident.

Work of the Burleigh Air Compressor.

Not long since the Richmond Consolidated mining company, one of the two principal mining companies of the flourishing town of Eureka, Nevada, had occasion to make inquirv into the merits of the best air compressors and rock drills in the market, with the view of introducing them in their mines. The compauy is an English one, and the mine is one of the very few on the coast owned by English capitalists which has been a financial success, and the managers are deserving of having the best machinery procurable. To accomplish this they desired the dealers representing the different machines offered for sale to send to the company indicator cards, taken from both air and steam cylinders; also frictional cards—intimating that whichever could practically demonstrate the greatest possible economy per horse-power would be the one selected. Messrs. Parke & Lacy, agents of the Burleigh drill and air compressor, in this city, sent the indicator cards of their machines, but no other manufacturers complied with the request. So that the result was Parke & Lacy obtained the order for $25,000 worth of machinery of the Burleigh pattern, which includes air compressors, drills, columns, etc. The compressor alone weighs 24 tons, and is a duplicate of that owned by the Eureka company.

As a matter of interest to engineers and mining men we have had engravings made to represent these indicator cards by which those versed in such matters may see how the compressors work.

To those not understanding the indicator diagrams it may be explained that the indicator is a small instrument temporarily attached either to the top or bottom of the cylinder for the purpose of ascertaining the pressure of steam at various parts on the stroke. It not only discerns the actual power at work in the engines, but it enables one to ascertain the working condition of the engine, and whether there are any defects in those parts of the machinery by which the steam is admitted to the piston; for instance, whether the slides are properly set or leaky; whether the stopes on the intermediate shafts are properly placed; whether the steam ports are large enough; and consequently whether a different arrangement of the working parts of the machinery would be advisable. In fact, in the hands of a skillful engineer, the indicator is as the stethoscope of the physician, revealing the secret workings of the inner system and detecting minute derangements in parts obscurely situated.

Fig. 1 represents the steam card taken from an 18-inch diameter cylinder, 24-inch stroke, making 40 revolutions per minute; steam cut off at one-sixth stroke; consequently shows that five-sixths of the steam is worked expansively, the above working with a boiler pressure of 77 pounds. But initial pressure on steam cylinder is 70 pounds, which, after working one-sixth of the stroke, shows a pressure of 69 pounds. After traveling four inches more, a pressure of 50 pounds is shown. In another four inches, 28.50 pounds is shown, then 20.50 pounds, then 16 pounds, and at completion stroke pressure on steam piston is only 12 pounds, making in all a mean pressure of 36.4 pounds throughout the strike.

Fig. 2 represents the card taken off the air cylinder, working in connection with and driven by the engine, the card of which is shown in Fig. 1. The diameter of air cylinder is 24 inches; stroke, 20 inches; making 40 revolutions per minute. Of course the piston commences at atmospheric pressure, and in making the first five inches of the stroke, it shows five square inches pressure in the air cylinder; the second five inches, 17.50; the next five inches, 46.50. The last five inches shows the full compression up to 46 pounds. The half pound at the 46.50 point is due to the lifting of the valve in the air receiver. When the air piston commences to descend, it forms a partial vacuum for about one-third of the downward stroke of the air piston, which the card explains, showing that there is no back pressure in the air cylinder, and that every portion of the air is expelled at each stroke. This is due to a small injection of water forced into the air cylinder during its stroke. This air card shows an entire pressure throughout the stroke of 473½ pounds, or a mean pressure of 23.69 pounds.

Fig. 3 shows the steam card of the same engine described as per card shown in Fig. 1, except that it is working at a higher pressure. In Fig. 3 the engine is making 56 revolutions, boiler pressure 80 pounds, or initial pressure 74 pounds; cut-off at one-quarter stroke. This card shows a total pressure of 1,055 pounds, and a mean pressure of 43.5 pounds.

Fig. 4 is the card from air cylinder of the same size as that shown in Fig. 2, worked under condition of steam as shown in Fig. 3, and in connection with it. The total pressure shown is 710.50 pounds, and the mean pressure is 35.50.

Fig. 0 shows a frictional card from the same sized steam cylinder running free as shown in Figs. 1 and 3, but making 60 revolutions with a boiler pressure of 78 pounds and an initial pressure of 55 pounds in the steam cylinder. All the cards are on a scale of 40 to the inch except Fig. 2, which is 30 to the inch.

These cards are made from tracings of the original cards taken off the machine now working the Overman mine on the Comstock. Although we have been frequently asked for information as to the relative efficiency of air-compressing engines by intending purchasers, we have not before had an opportunity to exhibit cards from any of the machines on the market. These cards will show to any engineer or mechanic exactly what is performed by the machine from which they are taken. We shall be pleased to publish the cards from other compressing engines if they are furnished to us for the general information of our mining readers, as it will be a benefit to all.

INDICATOR CARDS SHOWING WORK OF BURLEIGH AIR COMPRESSOR.

A most distressing famine afflicts Morocco.

The Sun Made of Metal.—In a recent article in the *Nineteenth Century*, by Mr J. Norman Lockyer, the writer very strongly objects to Dr. Draper's discovery of oxygen in the sun. Mr. Lockyer says he has gone carefully over the whole ground, and finds: First, that the photograph on which Dr. Draper bases the discovery is not one competent to settle such an important question. Second, that he does not find the coincidences between bright solar lines and oxygen lines in the part of the spectrum with which he is most familiar. Third, that comparing Dr. Draper's photograph with the fine photograph of the spectrum obtained by Mr. Rutherford, he "fails to find any true bright line in the sun whatever coincident with any line of oxygen whatever." Mr. Lockyer sums up the evidence as to the sun's composition in these words: "So far as our uncontested knowledge goes, the sun is chiefly made of metal, and on this account is strangely different from the crust of our earth, in which the metals are in large minority."

Contracts for building 40 iron bridges on the Chili and Southern Railroad are said to have been secured from the Chilean Government by American manufactnrers.

Continued from page 130.

Union Pacific railroad. This divides the Rocky mountain forest into a southern and a northern portion. The southern is completely isolated. This northern, in a cooler and less arid region, is larger, broader, more diffused. Trending westward, on and beyond the northern boundary of the United States, it approaches and here and there unites with the Pacific forest. Eastward, in northern British territory, it makes a narrow junction with northwestward prolongations of the broad Atlantic forest.

So much for these forests as a whole, their position, their limits. Before we glance at their distinguishing features and component trees, I should here answer the question, why they occupy the position they do; why so curtailed and separated at the south, so much more diffused at the north, but still so strongly divided into eastern and western? Yet I must not consume time with the rudiments of physical geography and meteorology. It goes without saying that trees are nourished by moisture. They starve with dryness and they starve with cold. A tree is a sensitive thing. With its great spread of foliage, its vast amount of surface which cannot diminish or change, except by losing that whereby it lives, it is completely and helplessly exposed to every atmospheric change, or at least its resources for adaptation are very limited, and it cannot flee for shelter. But trees are social, and their gregarious habits give a certain mutual support. A tree by itself is doomed, where a forest, once established, is comparatively secure.

Trees vary as widely as do other plants in their constitution, but none can withstand a certain amount of cold and other exposure, nor make head against a certain shortness of summer. Our high northern regions are therefore treeless, and so are the summits of high mountains in lower latitudes. As we ascend them we walk at first under spruces and fir trees or birches. At 6,000 feet on the White mountains of New Hampshire, at 11,000 or 12,000 feet on the Colorado Rocky mountains, we walk through or upon them; sometimes upon dwarfed and depressed individuals of the same species that made the canopy below. These depressed trees retain their hold on life only in virtue of being covered all winter by snow. At still higher altitudes the species are wholly different; and for the most part these humble alpine plants of our temperate zone, which we cannot call trees, because they are only a foot or two or a span or two high, are the same as those of the Arctic zone, of northern Labrador, and of Greenland. The Arctic and the Alpine regions are equally unwooded from coal.

As the opposite extreme, under opposite conditions, look to equatorial America, on the Atlantic side, for the widest and most luxuriant forest tract in the world, where winter is unknown and a shower of rain falls almost every afternoon. The size of the Amazon and Orinoco, brimming throughout the year, testifies to the abundance of rain and its equable distribution.

The other side of the Andes, mostly farther south, shows the absolute contrast, in the want of rain and absence of forest; happily it is a narrow tract. The same is true of great tracts either side of the equatorial regions, the only district where great deserts reach the ocean.

It is also true of great continental interiors out of the equatorial belt, except where cloud-compelling mountain chains coerce a certain deposition of moisture from air which could give none to the heated plains below. So the broad interior of our country is forestless from dryness in our latitude, as the high northern zone is forestless from cold.

Regions with distributed rain are naturally forest-clad. Regions with scanty rain, and at one season, are forestless or sparsely wooded, except they have some favorable compensations. Rainless regions are desert.

The Atlantic United States in the zone of variable weather and distributed rains, and the Gulf of Mexico as a caldron for brewing rain, and no continental expanse between that great caldron and the Pacific, crossed by a prevalent southwest wind in summer, is greatly favored for summer as well as winter rain.

And so this forest region of ours, with annual rainfall of 50 inches on the Lower Mississippi, 52 inches in all the country east of it bordering the Gulf of Mexico, 45 to 41 in all the proper Atlantic district from East Florida to Maine, and the whole region drained by the Ohio, diminished only to 34 inches on the whole Upper Mississippi and Great Lake region, with this amount of rain, fairly distributed over the year, and the greater part not in the winter, our forest is well accounted for.

The narrow district occupied by the Pacific forest has a much more unequal rainfall, more unequal in its different parts, most unequal in the different seasons of the year, very different in the same place in different years.

[To be Continued.]

Material and Labor.—A piece of iron, costing, in its rough state, one franc, is estimated by a French journal connected with the metal trade to be worth, when made into horse-shoes, three francs; into agricultural implements, four francs; forged into ornaments, 45 francs; converted into needles, 75 francs; steel buttons, 900 francs; employed as polished steel for decorative purposes, 2,000 francs; and made into shirt studs, 6,000 francs.

An International Exhibition will be held in Melbourne in 1880.

Useful Information.

Oils Used on the German Railways.

A paper by W. R. Browne in the *Railroad Gazette* gives various particulars concerning the operations of German railways. We quote a few paragraphs concerning the results of their experiments with lubricating oils:

Rape Oil.—Raw rape oil, without any admixture, has been in general use on most German railways since the year 1846. At first from 25% to 75% of pure turpentine was mixed with it to prevent its congealing in cold weather, but this was soon abandoned on account of its high price and because it clogged the cotton-waste used for drawing the oil to the journal. A better mode of rendering rape oil fit to be used in cold weather in axle-boxes with cotton-waste has been invented by Dr. Ziureck, of Berlin, and consists in adding rectified petroleum. The experiments made by him have shown that a mixture of 95% of rape oil and 5% of rectified petroleum congealed at 8°-9° Cent.; 90% of rape oil and 10% of rectified petroleum congealed at 10°-12° Cent.; 85% of rape oil and 15% of rectified petroleum congealed at 15°-16° Cent.; 80% of rape oil and 20% of rectified petroleum congealed at 19°-20° Cent. On several lines the rape oil is being mixed with oil of rosemary (½ lb. in 100 lbs.) for the purpose of rendering it unfit for domestic uses.

Olive Oil.—The excellent lubricating qualities of olive oil are shown by the small quantity of free oleaginous acid and slimy albuminous matter it contains, which makes it less liable to clog, by its moderate degree of cohesion and complete absence of mineral acids. Several large railway companies in Germany have employed it for these reasons almost exclusively; but as rape oil is generally much cheaper in that country, strong efforts have been lately made to supersede olive oil by rape oil, and on almost all German lines these have been successful. On English lines, however, olive oil is still preferred, where grease has not superseded it.

Oil of Rosin.—Oil of rosin in the raw state is not adapted for lubricating purposes, as it contains acids which gradually act upon the iron axles; but by neutralizing it with potash, soda or magnesia, it can be made into a good lubricant. A better method is to add to the rosin from 5% to 10% burned lime previously to subjecting it to a dry distillation process, by which the acids are confined at the moment of their generation. A lubricant supplied to the Austrian State railway in 1861 and 1862, and consisting of two parts of oil of rosin and one part of olive oil, gave a better result than either pure rape oil or olive oil, but it disappeared again from the market when the rosin rose in price during the Rebellion

Mineral Oils.—Filtered raw petroleum has lately been employed as a lubricant on the Austrian railways, the volatile parts having been first evaporated at the boiling point of water, and a small percentage of vegetable and animal oils added. The first experiments made with it were not very promising, the oil being too thin and the journals heating frequently; but by degrees the oil was improved and special axle boxes were made to meet its requirements, so that petroleum is now rendered a reliable lubricant, at a considerably lower cost than rape oil.

New Use for Seals.—An English exchange has an article on the possibility of training seals to catch fish. The following are the leading points. There exists an animal which might be trained to render us great service, that is the seal, which is slaughtered so mercilessly for the sake of its oil and skin. Intelligent and affectionate, it possesses all the qualities suitable for a domestic state. The director of the museum at Dijon had so skillfully tamed one some years ago that, though by nature amphibious, its primitive habits were changed, and it rarely went into the water, placing itself during the winter close to its master in the warm corner of the fireside, stretched on the wood ashes. If pains were taken to teach the seal, it might become to the fisherman what the dog is to the hunter. Nor need we despair of such a result, for the Chinese train the remora or sucking fish to catch turtles, and the heron and cormorant to capture fishes. The coasts of England would be fit places for the education of the seal. The value of such help may be imagined when we think of the great solitude of the sea, so many times larger than the space covered by land, where man has no ally, and can only count upon those who dread him. What an interest for him in the very element itself to have a friend and companion who would follow him in his fishing expeditions! There are not wanting conclusive results which have been obtained in individual cases; and if the same care were extended to the race, we may say that the seal is an ally ready prepared by nature.

Recipe for a New Explosive.—Bjorkman of Stockholm, Sweden, gives the following recipe for the manufacture of the new explosive vigorite. Mix in a wooden or rubber vessel 5 to 20 parts of sugar or molasses, 25 to 30 parts of nitric acid, and 50 to 75 parts of sulphuric acid. Twenty-five to 50 parts of this mixture, called nitroline, are mixed with 15 to 35 parts of nitrate of potash and 15 to 35 parts of cellulose.

Basket Willow on Embankments.—Basket willows are warmly recommended by a German official for the planting of the slopes of railroad excavations and embankments, especially where the soil is loose. On one of the leading railroads of Prussia they have been tried and found to answer admirably. A perfect network is formed by the roots which binds the whole surface firmly, the thick green growth transforming the raw and ghastly gashes in the earth into a beautiful thicket; the men who take care of and watch the track can easily care for the willows, which grow readily in dry as well as wet soil, if it is a little loose, and where there is market for basket material the growth can be made profitable. There are hundreds of kinds of willows, but those recommended for this purpose are the *Salix viminalis*, the *Salix prucinosa*, but most of all the *Salix amygdalina* (*triandria*). In dry ground the cuttings should have a good length underground. They will then put out a multitude of roots in every direction and make up for the want of abundant moisture by the extent of the ground from which they draw. If there is any way to hide some of the horrible wounds which railroads have made on Nature's face, it is much to be hoped that it will be tried; and the advantage offered by the willow in preventing the washing of slopes, gives an economic as well as an esthetic reason for planting it.

The Best Baits for Insect Traps.—M. E. C. Carriere has lately been trying a number of experiments on the best baits for insect traps, and gives an account of them in the *Revue Horticole*. The results effectually disprove the truth of the old saying "that we may catch more flies with a spoonful of honey than with a gallon of vinegar." A number of glass fly-traps filled with different liquids, sweet and sour, were placed under some fruit trees which were subject to the attacks of flies and other insects. The traps were baited with honey, weak wine and water, beer and water, vinegar and water, pure beer, pure wine, crushed pears and water, and other liquids; and the victims were counted, after the traps had been exposed for three weeks, with the following results: The trap containing beer and water stood at the head, and contained 850 flies and other insects; pure beer stood next, with 631; the crushed pears, weak wine, and pure wine coming next, pure honey being at the bottom of the poll, with only 17 sufferers. No doubt the odor of the beer and water, which was in a strong state of fermentation, had a great deal to do with attracting the insects.

Coloring Brass.—The *Polytechnic* translates from a German authority an old recipe for the production of various colors on brass, but which, as it may be new to many of our readers, we reproduce: Dissolve 60 grains bitartate of potassa in a liter of water, to which add 30 grains tin salt (protochloride of tin) dissolved in a fifth of a liter, heat to boiling, and allow the resulting precipitate to settle. The clear liquid is now to be poured, under constant stirring, into a solution of 180 grams of hyposulphite of soda in one-fourth liter of water, and again heated to boiling, during which operation a quantity of sulphur will be separated. The resulting clear solution is now ready for use, and gives to brass articles suspended in it, or when applied on the metallic surface, according to the length of the exposure or the amount of the application, a great variety of shades of color. First follows a light color, then all shades successively from red, dark blue, light blue, and finally brown. The sulphide of copper produces similar effects.

Good Health.

A Preventive of Suicide.

We lately had a paragraph from distinguished Eastern students of insanity to the fact that suicide was not necessarily the result of insanity. Dr. G. A. Shurtleff, the able Superintendent of the Insane Asylum at Stockton, in a paper on Suicide read before the San Joaquin County Medical Society, bears the following testimony to the influence of religion as a preventive of suicide:

"There is nothing which, in contemplation of the final hour, so solemnly and profoundly affects man, or so surely influences his acts, as an unquestioned and steadfast belief in what concerns his condition beyond this brief, mortal life. This is religion, and if born and trained in its faith, it becomes an organized element of his mind, an acquired instinct, which is more likely to direct his thoughts and acts in these matters than aught which depends solely on the logic of human evidence and knowledge. Through this faith a belief in things unseen and not of this world, which lie beyond the reach of science, of human reason and of natural evidence, is established. The weapons which would assail it are human and of the earth, and do not extend to the mysteries of another world, which are seen only by the eye of faith. This professed belief itself must be insincere and a false pretense if it fail to exercise, in the same mind, control over the conduct of him who avows it.

"I can say positively, from my own extensive observation, that the precepts of the Christian religion, especially as taught in their long-established forms, exert a strong influence even in the disordered as well as the rational mind in deterring from suicide those who put a sincere and absolute trust in its faith. I have often heard expressed, under suicidal thoughts and temptations, the irresistible conviction of the tried and chaste Imogen:

> 'Against self-slaughter
> There is a prohibition so divine
> That cravens my weak hand.'"

Color Blindness.—We recently had a paragraph on the subject relating chiefly to the color blindness of railway engineers. Investigations have lately been made by Professors Cohn and Magnus, of the sight of 5,000 children with the following results: Of 2,761 boys there were 76 who suffered from this blindness, or 2.7%. Of 2,318 girls, there was only 1 incapable of distinguishing colors. Further a curious fact was established. Among 1,947 Christian boys, 42 were unable to make this distinction, or 2.1%; among 814 Jewish boys 34 or 4.1%; among 836 Jewish girls, not one. These results seem to prove that in the case of girls color blindness hardly exists at all, and that among Jewish boys it is about twice as common as among Christian boys, though local influences might possibly affect the results. In this connection we note that M. Favre has lately been studying Daltonism in France, and he finds there are in that country more than 3,000,000 persons thus affected. The number of females affected is to that of males as 1:10. He says that nine cases of Daltonism out of ten may be easily cured in young subjects, the best mode of treatment being methodical exercise upon colored objects. Mothers should be careful to develop the chromatic sense in their children. Examinations and exercises in colors should be conducted in all schools, etc.

Restorative Soup for Invalids.—Take one pound of perfectly fresh beef or fowl, chop it fine, add eight ounces of soft or distilled water, five or six drops of pure hydrochloric acid, 30 or 40 grains of common salt, and stir well together. After three or four hours the whole is to be thrown on a hair sieve, and the fluid allowed to pass through with slight pressure. On the flesh residue in the sieve pour slowly two ounces of distilled water, and let it run through while squeezing the meat. There will be thus obtained about 10 ounces of cold juice, possessing a pleasant taste of soup, of which a wineglassful may be taken at pleasure. It must not be warmed, at least not to a greater extent than can be effected by filling a bottle with it and standing this in hot water, since it is rendered muddy by heat, and deposits a thick coagulum of albumen with the coloring matter of the blood. If from any special circumstance, such as a free secretion of gastric juice, it is deemed undesirable to administer an acid, the soup may be well prepared by merely soaking the minced meat in plain distilled water. Children will frequently take the raw meat simply minced when they are suffering from great debility. One teaspoonful of such meat may be given every three or four hours.

Painless Operations.—The new antiseptic method of surgery which has but recently been introduced into this country, has been twice successfully tried at the Alexian Brothers' Hospital, Chicago, during the past two weeks. In each case a leg was amputated, and the patient rapidly recovered, experiencing no pain whatever from the use of the surgical instruments. The method of operation is as follows: The surface of the limb to be amputated is first sponged with a solution of one part carbolic acid to 20 parts water. The instruments are placed in a solution of one part carbolic acid to 40 of water. While the operation is going on, a spray atomizer throws a stream of a solution of carbolic acid, one part to 40 of water, into the wound. This makes the operation perfectly painless, and does away with the necessity for using chloroform or ether. The wound is then dressed with oiled silk saturated with sulphate of lead, which indicates the presence of sulphate of hydrogen by turning black, and shows whether the wound is suppurating. Six layers of medicated gauze are then placed over the wound, and the whole is covered with Mackintosh cloth.

The Stupidity of High Heels.—The absurd and ungainly practice of mounting the hinder part of the feet on stilts while the toes press the ground and bear the weight, is one against which it is not easy to write with temper. It does not need a knowledge of anatomy to convince the shallowest that the foot is forced into a wholly unnatural position and distorted, by the heel being raised and the body made to rest on the ball of the toes! It should be unnecessary to explain that this disturbance of the foundation throws the whole superstructure out of gear, and deranges every mechanical function. But as the foot looks somewhat smaller as seen from the front or side when placed obliquely, fashionable people will cling to the practice.

How to Meet a Dog.—A gentleman gives the following advice in relation to dogs: "If," says he, "you enter a lot where there is a vicious dog, be careful to remove your hat or cap as the animal approaches you; hold the same down by your side between yourself and the dog. When you have done this you have secured perfect immunity from an attack. The dog will not bite you if this advice is followed. Such is my faith in this policy that I will pay all doctors' bills from dog bites and funeral expenses for deaths from hydrophobia."

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Measuring Rainfall and Percolation; Horton's Wooden Pipe Joint; New Machinery for the Alexander Mine; The Mines and the Courts, 129. The Lowe Gas Process, 136. The Week; The Corona; Absorption of Knowledge; The Bicycle; The State Fair, 137. Patents and Inventions, 141.

ILLUSTRATIONS.—Horton's Improved Wooden Pipe; The Lysimeter, 129. Indicator Cards Showing Work of Burleigh Air Compressor, 134. Sectional Diagram of the Lowe Gas Apparatus, 137.

CORRESPONDENCE.—From Arizona; Facts and Questions about the Phylloxera; Analysis of Sydney Coal, 130.

MECHANICAL PROGRESS.—Effects of Forging on the Structure of Iron; Dry Dock Work; A Massive Drain Pipe Machine; Peat Made into Cement; Stowing Jute to Prevent Decay; Railroad Lamp; Progress of Shoe-Making Machinery, 131.

SCIENTIFIC PROGRESS.—Archæology in the Mississippi Valley; Examination for Trichina; The Intra-Mercurial Planet; Hayden's Survey in the Field; Electroscope of Silk; Antimony in Batteries, 131.

MINING SUMMARY from the various counties in California, Nevada and Montana, 132-33.

MINING STOCK MARKET—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 140.

NEWS IN BRIEF on page 133 and other pages.

USEFUL INFORMATION.—Oils Used on the German Railways; New Use for Seals; Recipe for a New Explosive; Basket Willow on Embankments; The Best Baits for Insect Traps; Coloring Brass, 135.

GOOD HEALTH.—A Preventive of Suicide; Color Blindness; Restorative Soup for Invalids; Painless Operations; The Stupidity of High Heels; How to Meet a Dog, 135.

MISCELLANEOUS.—The Atlantic and Pacific Forests.—No. 1, 130-35. Work of the Burleigh Air Compressor; The Sun Made of Metal, 134.

The Week.

The operations in mining stocks swell the volume of banking business immensely. This morning, August 29th, the clearance at the San Francisco clearing house was the largest ever made since the establishment of the institution. It amounted to $3,181,000, settled by the movement of $555,000.

Further evidence of prosperous activity on our coast is furnished by the reported determination of the Virginia and Truckee railroad company to build a branch to Bodie, and, though it may seem somewhat paradoxical, by the mining suits threatened, commenced and in progress.

The new railroad will take the route from Gold Hill to Dayton, to Fort Churchill via Sutro, across the Carson to Walker lake, to be crossed by ferry from the south shore of this lake to Aurora, to Bodie. It will pass through Lyon and Esmeralda counties, and perhaps a corner of Churchill. The country drained is reported by prospectors to be rich in mineral resources. Even if this prove visionary, the first spike driven in a road connecting us with Bodie, will mark the opening of an era most happy for all concerned.

When a man finds something that is very good, there are always plenty of individuals watching keenly for a chance to wedge in some claim, even if it be but the part of one. Some characters seem willing to lose the spicy pleasure of anxious, hopeful labor, if some one else will only guarantee them their bread and butter. It can hardly be unjust to class among these, men who, after abandoning mining ground to more acute and enterprising workers, until these latter have found a good thing, show then a disposition closely related to that exhibited in the nursery by the dog in the manger, and try to *get back* that "good thing" which they neither ever owned, nor of themselves would ever have heard of. We have enough of this and to spare in California and Nevada. In so far as it concerns the quality of our mines, it is not altogether a bad sign. May the law be prompt to defend all honest claims, and quick to protect industrious and daring men in the possession of their just acquisitions. For if the law halts, justice will find a shorter path. Violence will repeat the story of the Black Hawk mine.

The Corona.

We have been the guests of old sun for a goodly number of millenniums. We have partaken of his good cheer; we have sat by his fireside; in fact, we, together with our respected globe, have lived, longer than we can remember, the lives of mere parasites, drawing every iota of our physical nourishment from the sun. Still, it is only within the last few decades that we have commenced to inquire in earnest who and what our host and ruler is. At first we learned from Egypt the small conceit that the sun and all the heavens rolled obedient to our will, and Egypt knew how to calculate eclipses so well that for 16 centuries we believed her. Then Kopernik and Kepler overthrew the doctrines of the Almagest; the telescope was invented, and the world began to "find out a thing or two" about that nearest star, upon which, as was little by little discovered, they were so helplessly dependent.

With true fidelity to human nature, the telescopists first discovered the faults in the sun's surface; they pointed to the "sun spots." When a total eclipse offered opportunity, the rose-colored promineuces and the "corona" excited wonder and admiration. And, to-day, whenever a total eclipse is heralded by the astronomers, observers hurry from all parts, armed with the most costly instruments, to witness a phenomenon that is not only imposing in its sublime beauty, but that becomes with the advance of science, at each recurrence, more instructive.

The rose-colored prominences may be studied now with the aid of a spectroscope without waiting for an eclipse. Of the attractive objects at an eclipse, the corona is at present the most interesting of those immediately connected with the sun.

What is the corona, and what is its relation to the sun and its influence on us, are questions that are by no means answered. As science and art have advanced, every new means has been made use of to aid in answering these questions. As in every other department of progressive research, theories have been brought forward according with the knowledge of their times and have one by one fallen back before the arguments of the next more fully equipped and enlightened investigators. The study of these theories and of the growing knowledge with regard to the corona is the study of the development of many arts and sciences, with here and there thrown in, as a relief from abstract reasoning and weary details, an entertaining picture of human nature.

When the corona was first observed the pictures of it were drawn from memory after the eclipse was over. This opened the door to personal errors and gave the imaginations of excitable observers a chance to astouish the world with the strange appearances of the corona. The views of the corona that come to us from these times, present, as might be expected, great differences and the variations in verbal testimony are quite amusing. To one the corona resembled "the ornament around a mariner's compass." To another it looked like "jets of steam spurting out from behind a ball of iron." By and by they reduced it to the now standard simile, and it remains to this day like "the glory seen around the heads of saints in old pictures." One Frenchman in Brazil got up such a striking picture of the corona that his conscientious brethren gravely remarked that it was a great pity there was no one else there to see it. According to some reports, the corona was pure white light and round in shape. Others made it greenish-white and trapezoidal. Then it has been yellowish and pinkish-green and silver-gray, until one begins to realize the task of a judge in taking testimony. By one school the corona was ascribed to the atmosphere of the moon; by another to the influence of our own atmosphere; by still another it was regarded as a solar appendage. We can appreciate Burton's mood when he wrote: "In the meantime the world is tossed in a blanket amongst them, they hoyse the earth up and down like a ball, make it stand and goe at their pleasure. One saith the sun stands; another, he moves; a third comes in, taking them all at rebound, and, lest there should any paradox be wanting, he finds certain spots and cloudes in the sun, by the help of glasses, which multiply, saith Keplerus, a thing seen a thousand times bigger *in plano*, and make it come 32 times nearer to the eye of the beholder."

But we are growing older now. Photography removes all danger from excitable temperaments in observers. Polarization of light has been investigated and brought to our aid. The spectroscope has added its indispensable quota. Unending improvements in all instruments have helped us. We have learned that the moon has no atmosphere. A peculiar line in the spectrum of the corona proves that it cannot be due to our own atmosphere. And, to-day, although there is still indefinite ground for investigation, many concurring evidences point to the theory that the corona is nearly related to the aurora borrealis and the zodiacal light, and is probably an infinite collection of little meteors, subjected to never-ending attraction towards and repulsion from the sun, and containing, or else associated with, some element which we have never met upon the earth.

What does all this amount to? Is not the product sadly disproportionate to the outlay? What use under the sun is this theory to a man struggling after his bread and butter? Only let him be patient and some such theory may some day make his planting and sowing easier and his watching for the harvest less anxious.

Absorption of Knowledge.

When a man goes into the country for a vacation, who has been accustomed to office work, he finds, perhaps, the greatest enjoyment in being in the sunshine. He lies at full length in it, basks in it, revels in it. Unconsciously, he absorbs health, strength and spirits from old Sol's beams, and comes back with the skin off his nose, perhaps, and a bronzed complexion; but the sun baths have invigorated him more than anything else could have done. He feels the good effects for many months after, but needs at least an annual repetition of the prescription to keep him in health.

Perhaps this unconscious absorption into the system does no more good than what we endeavor to force there; and this holds true as well with the mental as with the physical faculties. Many people who never have the opportunity or time to read or study, still become as well informed on general topics as others who pay no attention to what they see about them, but put their trust entirely in books. It is worthy of note, that, as a general thing, the information gained by those who get their knowledge by observation is more practical and more ready at hand, than that of those who read rapidly and forget rapidly, too.

A great deal of this knowledge which we acquire during our lives comes to us unconsciously. We do not remember where or how we learned a certain fact, although knowledge of it comes to us when we need it. It seems as if the mental faculties were always at work storing away facts when the orgauism in which they are placed is unconscious of the act. Other things which a passing glance brings to our attention, we forget in a moment, to remember years afterward when the occasion for the use of the knowledge then acquired, arrives.

With these facts before us, then, should it not be a duty with all of us of progressive tendencies to place ourselves in the way of absorbing information? We always recognize a traveled man, who has seen many lands, as one possessing more than usual knowledge, and whose fund of information is such as to give pleasure to himself as well as others. When we come to think of it, he has simply trusted his body to the care of certain railroad, steamship and stage companies, and been rolled across the ocean, or trundled over a continent, from place to place, and his mental faculties have been at work all the time, gathering, absorbing and accumulating information on all manner of people, countries and subjects. We never hear of travelers taxing their brains much, as, in fact, many travel to relieve themselves of thinking, and others go to rest their brains. They exercise their bodies enough, but when they return we see less change in their physical than in their mental faculties, showing that the brain has unconsciously worked without regard to the man. The dullest-minded, however, have been improved simply from the unconscious absorption of knowledge.

We, who have not the opportunity of seeing many lands, but whose circle of observation is bounded by narrow limits, should take every opportunity to explore those limits to the fullest. We need not trouble ourselves very much further than the mere physical exertion is concerned, for the mind will unconsciously work for us. Of course the more prudent among us will direct the attention of the mind upon various subjects, and thus far assist the faculties; but even if we do not, the mind will not be idle under any circumstances, but will continue its work silently, but surely, in the absorption of knowledge.

It is not intended to imply that study or observation should be ignored, or that our faculties should not be exercised on all occasions where it is possible they should be; but simply that we should give our minds an opportunity of receiving impressions which may be valuable to us. When international exhibitions are given, those of us able to go should go. When local exhibitions of arts and manufactures are arranged for our benefit, we should take advantage of the occasion and visit there also. In any building or place where the works of man are brought together, no one can be a visitor without learning something of value from even the most casual examination. Even if the visit is made to pass away the time, the mental faculties will take note of many things and store them up for future reference.

Who Wants Employment?—The New Almaden Quicksilver M. Co. is now employing a number of Chinamen at common labor for $1 per day, merely as a makeshift for white labor at $2 per day, which the Superintendent is unable to obtain. If there are any good white laborers at $2 per day who want the place, they can have it by applying at the mine.—*San Jose Mercury, August 27th.*

Connecticut used Paris green to kill potato bugs. The rains carried the poison to the rivers and killed the fishes.

The Bicycle.

Most of the visitors to the Fair this year have noticed the English bicycle, which is on exhibition near the carriage exhibit. To the casual observer it is simply a curious toy. To those who remember the old velocipede, about which there was a short lived furore upon its advent seven or eight years ago, it will at first appear to be an overgrown modification of the old machine, and thus will most likely pass it by, with the thought or remark that such machines are of little use. This is a mistake which naturally arose, partly from the defective construction of most of the old velocipedes, which were hastily put together, and soon became so worn that their rattle could be heard for blocks; and partly because the seat was placed so far back that the movement of propelling was a forward push, which must be resisted by an equal pull with the arms, and would soon exhaust the most expert rider.

With characteristic impatience we threw it by; but the English people, believing that there was something in it, set to work to improve, until the present bicycle is the result.

The principal features are the enlarged front and diminished hind wheel, which renders it easy to mount and dismount; the saddle placed so nearly over the front wheel that the propelling is a downward push, almost identical with the motion of walking, but without the labor of carrying the body, which is supported by the saddle, and the employment of rubber tires, and a perfection of mechanism which renders the machine absolutely noiseless upon any sort of road. The great size of the wheel gives a movement of from 12 to 15 feet for each revolution, consequently what appears to be a very dilatory and slow movement, will easily pass over from five to seven miles per hour, and this is one great charm of the machine to those not ambitious of racing honors.

Upon any ordinary country road and over any reasonable hills such a pace can be maintained, with but little fatigue, for an entire day; while a speed of 10 or 12 miles per hour can easily be attained upon a good smooth road. A vast number of tourists in Europe employ the bicycle, as being more rapid and independent than any other method of travel, and they make from 40 to 100 miles per day, according to their ability, desire, or the quality of the road.

Two young Frenchmen started from Paris on the 16th of March and returned on the 24th of April, having traveled in France, Italy, and Switzerland, a distance of over 3,000 miles during the trip. Their longest single day's run was 90 miles. The race this year from Bath to London, England, upon the public road, 100 miles, was won in a little over eight hours, a feat beyond the powers of any horse.

The State Fair.

From a correspondent we learn that the efficient Secretary of the State Agricultural Society, Major Robert Beck, is hastening the many improvements to be made to the pavilion and park, and that everything will be in readiness by the time set to open the fair, September 16th. Among the many improvements and alterations being made for the comfort and convenience of exhibitors and visitors at the pavilion, might be mentioned a grand balcony on the west side of the hall, 126x18 feet, with two rows of seats. New stairs seven feet wide have been put up between the lower and upper halls. A new floor has been laid in the new hall on the east and all the shafting and gearing has been removed to a building in the park 80x90 feet, erected especially for the exhibition of machinery. The department from which it was removed will be devoted to the exhibition of vegetables, fruits, and flowers.

An amphitheatre is being erected at the park for the exhibition of stock. The building is in the form of a double octagon, having 80 feet in diameter, 16 sides and 16 angles. Forty feet around the center pole will be furnished with seats for the use of visitors, and the remaining space will be devoted to the exhibition of stock.

The stands in the park have been enlarged and improved and have a seating capacity for 6,000 people. Provision has also been made for stabling for 500 animals, together with large and convenient pens for sheep, Angora goats, swine, and coops and cages for fowl. In fact the appointments and accommodations are confidently believed to be superior to any other agricultural society in the union. The officers feel assured that the fair will be a grand success.

On August 27th Jack O'Harra and three others tried to jump the Blackhawk ground at Bodie. The employes fired upon them and O'Harra was fatally wounded.

It is stated that a new Turkish loan of £5,000,000 is in contemplation, to be guaranteed by the British Government.

Sir George Nares, the Arctic explorer, is about to survey the dangerous parts of the Straits of Magellan.

The heavens at Helltown, according to the Chico *Record*, have showered down manna in the shape of fishes.

The Lowe Gas Process.

There is hardly a branch of technology which has given rise to more vexed discussions of late years than the manufacture of illuminating gas. There seems to be a certain amount of dissatisfaction at all times afloat in a community which is ever ready to become fixed upon any corporation or body of men who are receiving a reasonable return for capital invested. Aware of this, it is not our purpose to attack in any manner the existing gas companies; but simply to state such facts as appear to be proved with reference to what seems to be an important improvement in gas manufacture.

The idea of manufacturing an inflammable gas from the action of steam upon burning charcoal and then giving to it an illuminating power by charging it with some hydrocarbon vapor is not a new idea by any means. Such a process was in existence at least 25 years ago. But there were certain practical objections to the method of manufacture in vogue at that time, which finally led to its abandonment.

The subject has, however, never been entirely given up, but it has been kept alive while progress was made in other branches of technology. The Simens gas producer, which has proved such an aid in metallurgical operations, was invented, then the regenerator principle was discovered, and finally the increasing discoveries of petroleum so cheapened the price of the illuminant hydrocarbons that all the conditions for the new improvement were ripe. Prof. T. S. C. Lowe was the man who took advantage of these favorable conditions, and strikiug out in an entirely new path, invented what seems without exception to be the most improved method of manufacturing water gas.

For a moment let us consider the chemical principle involved in the production of the so-called water gas. It is a familiar fact to all who are acquainted with even the first principles of chemistry that when steam passes through a layer of red-hot coals there is produced by the double decomposition a mixture of hydrogen and carbonic oxide gases, there being by supposition a sufficient amount of ignited carbon to complete the reaction. Otherwise carbonic acid in varying proportions will be an ingredient also. In case the reaction is complete there will be produced for each volume of steam at 100° C. which has been decomposed, one volume of carbonic oxide and one volume of hydrogen. This mixture of equal volumes of hydrogen and of carbonic oxide is then water gas pure and simple. In practice less carbonic oxide is usually formed, and in its place appears a variable but small amount of carbonic acid. This mixture is very inflammable and produces a great heat when ignited, but is not a light-producer. It must be mixed with some hydrocarbon vapor or gas. In this the various methods differ somewbat in detail. In the more successful of them, like the Tessie do Motay, the water gas is drawn from a gas receiver where it has been stored since its production, and is passed over a sheet of crude petroleum or naptha heated from without by hot water, and the gas thus saturated with hydrocarbon vapor is changed entirely into a mixture of permanent gases hy passing it through retorts heated from without, and filled with bricks to increase the heating surface.

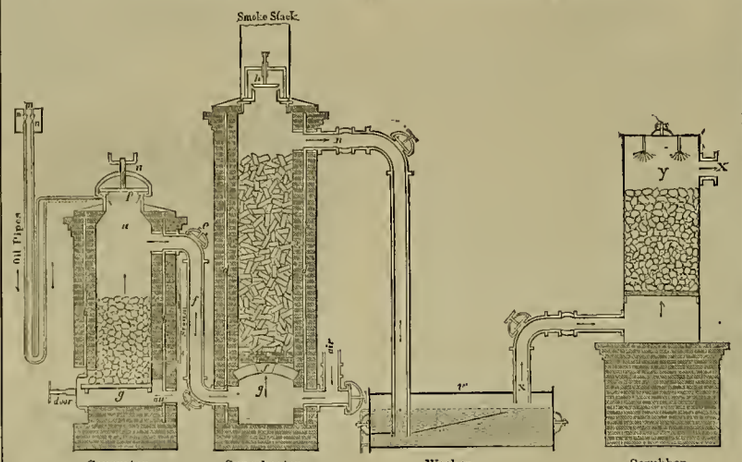
The Lowe Apparatus.

We now come to the method of Prof. Lowe. The apparatus is shown entire in the accompanying cut. The only change is a slight shortening of the connecting pipe and an omission of the lime boxes. It consists of a generator, a superheater, a washer and a scrubber, the essentials, of course, being the generator and the superheater. They are both built of brick, with a fire-brick lining, *c*, *c*, and *e*, *e*, with a space for non-conducting material, *b*, *b*, and *d*, *d*, between the two brick walls, and are both surrounded with a shell of boiler iron. The generator is in effect a cupola furnace, with an air-tight grate door and an air blast at the bottom. A pipe allows the introduction of steam into the midst of the burning fuel when necessary. The charging of fuel takes place through the clamped door, *n*, at the top.

The superheater is a similar stack, somewhat higher, and filled with fire brick loosely piled together. At the bottom an air blast can be introduced, and at the top is a valve, *h*, which can be kept closed or open at pleasure by a weight and pulley. The process is now as follows: The grate, *g*, of the generator being covered with kindling, the apparatus is charged with anthracite or coke from the top to the depth of three or four feet. The fire is lighted and the air blast turned on at the bottom. The door, *n*, being closed, the gases, essentially carbonic oxide, coming to the top of the fuel, pass in the direction of the arrows down the connecting pipe till they reach the bottom of the superheater, at *g*, where they are ignited and are supplied with air by the blast pipe shown in the cut. The valve, *h*, is left open and consequently the intensely heated gases pass up the superheater, and impart their heat in the most effective way possible to the mesh of fire brick with which it is filled. As this gas, being now mostly carbonic acid, is useless for gas purposes, it does not pass into the washer, but through the open valve, *n*, into the smoke stack. By the time the anthracite has become heated to a good red, the bricks of the superheater have assumed a white heat. At this point the air blasts are both shut off; the valve, *h*, of the superheater is closed, a steam jet is let in at the bottom of the glowing coal of the generator and the mixture of carbonic oxide and hydrogen gases pass up from the fuel. At the same time a constant stream of crude petroleum, or of naptha or gasoline, when that is obtainable at a less price, is let in from the oil pipes through the jets, *p*, in a shower upon the ignited fuel. It is thus instantly vaporized and the mixture of carbonic oxide and hydrogen gases pass into the superheater saturated with these illuminant vapors. Here they come into contact with the white-hot bricks and become changed into permanent gases. The exact nature of the chemical reactions which occur in the superheator is not known. It is certain, however, that they vary according to the proportions of water-gas and hydrocarbon vapor, the temperature of the bricks, the rapidity of the current, etc. The operation is repeated when the apparatus is cooled below a certain point. The rest of the operations which the gas undergoes, the washing, scrubbing, lime purification, etc., are precisely like those of ordinary coal gas, with the exception that it is claimed to be less difficult to purify.

One cannot fail to admire the simplicity and compactness of the whole apparatus in comparison with the extensive space required by the retort system.

According to the report of Prof. Henry Wurtz, Nov. 1st, 1875, an apparatus of the following dimensions: a generator nine feet high, 28 inches internal diameter, half filled with clean anthracite, and a superheater, 15 feet high by 28 inches internal diameter, produced at each run, 3,000 cubic feet or more, according to the degree of heat attained; and as the average time of heating up and generating gas was altogether one hour, 24 such runs were made in a day, or over 70,000 cubic feet of gas are obtainable in 24 hours from such an apparatus.



SECTIONAL DIAGRAM OF THE LOWE GAS APPARATUS.

So much for a brief description of a process whose success has been one of the vexed questions of the day, and about which there have been more contradictory statements than about any other question of a technical nature which has come to our notice for many years. Ever since 1875 the *Engineering and Mining Journal* has steadily given its sanction to the process, and we have carefully followed up the controversy which took place upon its pages, and have lately re-read the various articles, reports, replies and editorials which extend through several dozen numbers. On the other hand the *American Gas Light Journal* has as steadily fought the new process. So that between the opposing statements it is almost impossible to ascertain the truth. It is not our intention to enter this controversy. We shall merely give what seems to be established, and shall reserve our verdict until we have a better knowledge of the bottom facts.

The First Great Objection

To the water gas has been the amount of carbonic oxide which it was said to contain. We take from the report of Profs. Rogers and Stevens which appeared in the *Gas Light Journal*, November 2d, 1877, page 179, the following analysis of the Lowe gas:

Lowe Gas From Gasholder at Manayunk.

Hydrogen	42.86
Marsh gas	44.28
Olefiant gas	5.18
Carbonic oxide	3 43
Carbonic acid	.69
Sulphuretted hydrogen	.80
Oxygen	.14
Nitrogen (estimated)	.56
Ammonia, etc	2.00
	100.00

Lowe Gas taken from Pipe Tapped Between Purifier and Large Meter.

Hydrogen	64.66
Marsh gas	24.73
Olefiant gas	4.81
Carbonic oxide	2.72
Carbonic acid	.19
Sulphuretted hydrogen	.30
Oxygen	.41
Nitrogen (estimated)	1.31
Ammonia, etc. (estimated)	.37
	100.00

Analysis of Manayunk City (Coal) Gas for Comparison.

Hydrogen	47.72
Marsh gas	38.53
Olefiant gas	5.20
Carbonic oxide	1.90
Carbonic acid	.94
Sulphuretted hydrogen	1.03
Oxygen	.17
Nitrogen (estimated)	.85
Ammonia, etc (estimated)	3.66
	100.00

For the purpose of a more extended comparison, we give the following analysis of purified coal gas from some of the principal cities of Europe, which are taken from an address of Prof. Chandler read before the Gas Light Association (*Engineering and Mining Journal*, January 1st, 1876, page 11.):

	Heidelberg.	Bonn.	Chemnitz.	London Common.	London Canned.
Hydrogen	44.00	39.80	51.29	46.00	27.70
Marsh gas	38.40	43.12	36.45	39.50	50.00
Carbonic oxide	5.73	4.66	4.45	7.50	6.80
Olefiant gas, etc.	7.27	4 75	4.91	3.80	13.00
Nitrogen	4.23	4.65	1.41	0.50	0.40
Oxygen	.....	.....	0.41	.....	.....
Carbonic acid	0.37	3.02	1.08	0.70	0.10
Aqueous vapor	.....	.....	.....	2.00	2.00

It is evident that the smallest amount of carbonic oxide contained in this table exceeds by nearly 30% the greatest amount contained in the Lowe gas as given by Profs. Rogers and Stevens. But there is no doubt that there is usually a much larger amount of carbonic oxide in the Lowe gas. The analyses given by Prof. Morton and by Prof. Henry Wurtz usually place it as high as 26% to 27%. We have not as yet been able to find exact statements of the poisoning power of this gas. But it has been probably over-estimated. At any rate, wood gas which contains large amounts of it has not been found to be more dangerous than ordinary coal gas. Besides this, it is a matter of fact that the Lowe gas has a distinct odor, though different from that of coal gas. The great opposition to water gas in general is founded upon the fact that it was originally used without carburization for producing light by heating a coil of platinum foil. This gas had no odor. But the Lowe gas contains hydrocarbons from the petroleum and has a distinct odor, perhaps slightly less disagreeable than that of coal gas.

A More Serious Objection

Has, however, been brought up. The opponents of the process claim that it deposits soot and tar in the pipes of the consumers. The Lowe party claim on the contrary that the deposits are from the old coal gas accumulations that have been taken up from the pipes by the peculiar dissolving powers of their gas. We have been unable to sift the truth from the mass of conflicting statements that have come to our notice. It is not improbable that "soot" is produced at certain stages of the Lowe process. Tar, etc., occurs, but, according to Prof. Wurtz, in less amounts than in coal gas. But after all, the soot, etc., seems not to be a necessary ingredient of the *purified* gas, and its presence in the mains seems merely to indicate lack of sufficient purifiers.

Next as to Cost of Production.

This of course depends upon the price of anthracite and petroleum or naptha at the particular locality. From the report of Profs. Rogers and Stevens 5,200 cubic feet were made in half an hour with 248 pounds anthracite coal and 16 gallons of crude petroleum. This gives 48 pounds of anthracite and 3.08 gallons of petroleum to 1,000 cubic feet. It should be remarked that the candle power of this gas was low (12.51 to 13.95 candles), but the method of collecting and treating the gases was open to grave objections, and has been severely criticised. Besides, these gentlemen state that "it is within the power of the manufacturer to control, within a wide range, its [the illuminating power] by the use of a larger or smaller quantity of oil." The Lowe men, however, only claim to make a gas of 20 candle power with 90 to 60 pounds of anthracite, according to its freedom from ash, and three gallons of crude petroleum. At the works at San Jose, Cal., where a 20 candle gas is produced, they state that 50 pounds of anthracite are used and three gallons of crude petroleum. This estimate for coal includes all that is burned under the boilers for steam making. The engineer of the Lowe gas works at Baltimore, in a private letter dated May 9th, 1878, states that they were making with six sets of the apparatus 690,000 cubic feet in 24 hours. Using for this purpose for each 1,000 cubic feet in the holder, 60 pounds of anthracite and 4¾ gallons of naptha. The amount of coal includes all used for steam purposes, heating, building, etc.

The Relative Economy

Of this gas and of coal gas is a question which will depend very much upon circumstances. When anthracite and petroleum or naptha are cheap, and gas coal is high, with no market for coke, the water-gas method, with the small outlay for its compact apparatus, will have a great advantage, if all that is claimed for it be true. But on the other hand, when the conditions are reversed, the margin of profit will be much less. The gas men claim that it is not so much the cost of production which troubles them as the storage and distribution of the product itself.

We do not apprehend the need of any great terror on the part of the gas stock owners. If the new process proves itself a success they should certainly be the first to inform themselves of the fact. If they find that they can supply their customers with a better gas at a lower cost to themselves, it will certainly pay them better than any outsider to adopt the new improvement. It is just in such things that cautious progress stands in opposition to unwise conservatism. We would add a word to those most interested. Give the process a trial beside the retort system and under the direction of competent experts, and then you will be able to judge for yourselves whether or not it is worth your while to slowly introduce the new system as necessity arises of increasing production or of replacing worn-out retorts.

In the short space of such an article it is impossible to more than glance at the salient points of this interesting process. We have taken steps to settle some of the disputed issues, and hope shortly to be able to express a more unqualified opinion on this subject.

Address all communications to Chas. Holmes, Secretary Lowe Gas Co., room 14, No. 330 Pine street, S. F.

New Incorporations.

The following companies have filed certificates of incorporation:

Silver Queen M. Co.—Capital stock, $1,000,000. Directors—W. S. M. Wright, David Clark, T. J. Ludroig, C. G. Ames and G. L. Crane; all of Santa Rosa, California.

Calabasas L. & M. Co.—Location: Pima county, Arizona. Directors—J. P. Jones, Juo. Currey, E. L. Sullivan, George C. Perkins and C. P. Sykes. Capital stock, $10,000,000.

Old Dan M. Co.—Location: Bodie district. Capital stock, $10,000,000. Directors—C. H. Hobbs, F. B. Reynolds, A. H. Rutherford, C. A. Singletou and J. P. Dyer.

Last Resort M. Co.—Location: Bodie district. Capital, $5,000,000. Directors—W. M. Stewart, W. B. Carr, L. F. Lovelaud, James Morgan and F. W. Clute.

Monte Aquacarte M. Co.—Location: California and Costa Rica. Capital, $5,000,000. Directors—John Stuart, C. B. Dahlgren, Henri A. R. Moyne, D. E. Mellis and C. W. Carter.

North Fork G. M. Co.—Object: To operate the Calias and other gravel mines in Nevada county. Capital, $500,000. Directors—David L. Hill, E. Nichols, L. P. St. Clair, George Hill and Robert Cryer.

Ruby Silver M. Co.—Location: Arizona. Capital, $1,000,000. Directors—E. G. Freeland, H. M. Rosekrans, J. W. Kinsman, F. H. Wells and L. B. Seaver.

South Comstock Con. M. Co. — Capital, $10,000,000. Directors—Robert Sherwood, George Schultz, W. F. Myers, G. W. Rogers and J. M. Buffington.

Don Quixote M. Co.—Object: To mine in Mono county. Capital, $10,000,000. Directors—C. K. Hobbs, C. F. Singletary, A. H. Rutherford, F. B. Reynolds and J. P. Dyer.

Quartz Mt. G. M. and T. Co.—Object: To operate in California. Capital, $5,000,000. Trustees—H. H. Pearson, O. H. LaGrange, J. R. Hardenbergh, W. R. DeFrees, W. B. Murdock.

Handly M. Co.—Object: To operate in California. Capital, $10,000,000. Directors—Clintou Gurnee, R. F. Bunker, R. G. Brown, C. Reis, J. M. Walker.

R. E. Lee T. and M. Co.—Object: To operate in Bodie district. Capital, $6,000,000. Directors—W. B. Davenport, J. G. White, W. S. Chapman, Fred. W. Hadley, F. K. Bechtel.

Mont Blanc Con. Gravel M. Co.—Object: To operate in Nevada county. Capital, $1,000,000. Directors—Francis Souchet, George Edwards, Henry Bush, Apolonaire Ganthier and A. B. Brady.

The Ida mining company's stock has been listed on the San Francisco Board. This property lies between the Black Hawk and the Summit mines, in Bodie district.

There is said to have been an important discovery of gold diggings in the Shoshone mountains, Montana.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the lar gest west of the Mississippi), are constantly increasing. These fa cilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

DEWEY & CO.,
Patent Solicitors,
No. 202 Sansome St., S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
A. C. KNOX—Pacific Coast.
C. N. WEST—Santa Cruz, Monterey and San Benito counties.
A. C. CHAMPION—Tulare, Fresno and Inyo counties.

This is necessary to protect us and subscribers against the acts and mistakes of others.

Much Obliged, Etc.

PORTLAND, OREDON, June 26th, 1877.

DEWEY & Co., Patent Solicitors, S. F.—*Gents:* I am much obliged to you for courtesy shown me, and am much pleased with the manner in which you have done my business, and assure you, will cheerfully recommend you to my acquaintance needing such services. Hope to have a case again before long, of my own. I have been an inventor all my life, but let others reap the benefit, or had work stolen from me. Please have the extra copies of my patent, etc., mailed to me direct, and oblige

Yours truly. J. H. WOODRUM.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, $7.50. Postage, 50 cents extra

North Side, Above Battery, San Francisco.

Hand-Book of Arizona Territory,

by RICHARD J. HINTON,

(Of the San Francisco *Evening Post.*)

This volume is now ready. It is a large 12mo of 530 pages, accompanied by a

NEW MAP OF THE TERRITORY,

Compiled expressly for this work. This is the best map of Arizona yet published, and gives the latest mining districts. The volume will be profusely illustrated, containing full page lithograph views of the Loop, at Tehachape Pass, on the S. P. R. R.; Yuma, Prescott, Phœnix, Florence, Tucson and Tubac; the ancient church of San Xavier del Bac, ruins of the Tumacacori Mission and of Mount Wrightson, and other views of the Santa Rita Mountains. Calabazas, in the valley of Santa Cruz; Corrumacion Peak, the Arivc Valley and the ruins of Casa Grande.

Also, numerous other engravings of mines and scenes, comprising Mineral Park, Fort Whipple, Castle Dome, Ortman Flat, the Rio Verde Valley, Montezuma's Well, the Salt River Ruins, Indians, Public Buildings, Ancient Ruins and Remains, etc. In addition to these illustrations, the Hand-Book will contain

An Old Spanish Map of Arizona

And contiguous Territory, never before published; a copy of the famous Father King Map, and profile maps of the Mining District of Mohave County, in which the McCrackin mine is located; of Castle Dome District, Yuma County; of the Bradshaw District, near Prescott, where the Peck mine is worked; of the Pioneer, in which the famous Silver King is located; the Globe, where the Wheatfield, Stonewall Jackson and Miami mines are found; and of the extraordinary rich Santa Rita Districts, the Aztec and Tyndall.

The letter press will be crammed with valuable information, interesting description and accurate data as to the resources of Arizona—its geology, mineralogy, mines, mining, agriculture, etc.; also. of its roads, routes, fares, etc. Its historical chapter will be invaluable; and those on the Ancient People and Ruins of Arizona, as well as on the Jesuit Missions, Indians, etc., will prove of absorbing interest.

This is the most complete work on a new Territory or mining region ever issued. It is the result of conscientious observation and study, the author having made extended tours through the Territory, and being also in possession of the note-books of mining engineers and explorers, who spent years in examining this marvelous country, which is soon destined to be recognized as the Richest Silver Bearing region on this Continent.

The Hand-Book of Arizona

Will be handsomely printed, profusely illustrated, bound in flexible covers, and sold at retail for $2 each.

HINTON'S NEW MAP OF ARIZONA,

Handsomely colored and mounted, now ready for delivery. Retail, on rollers, for the wall, $2.50 each; in covers, $1.50 each. For sale by

DEWEY & CO.,

Publishers of the MINING AND SCIENTIFIC PRESS S. F.

Assessment Notice—Vigorit Powder Co., Jas. W. Baker, Secretary, S. F.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, $2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

THE EXPLORERS,' MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 372 pages and 83 engravings. By J. S Phillips, M. E. Price—cloth, $10.50; in leather, $12; postage 50 cents. Sold at this office.

MR. W. J. WOODLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

Single samples will be mailed from office for 50 cents, (and upward, according to size), postpaid. Wholesale and retail agents wanted.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News.*

BODIE AND ESMERALDA;

—BEING—

An Account of the Past History and Revival of Affairs

In the above named Mining Districts, with Scientific Reports thereon by PROFS. SILLIMAN and BLAKE, and the late J. ROSS BROWNE, with detailed description of leading mines, including Maps and Illustrations, by JOS. WASSON. Single copies, post paid, from this office, $1.

Opinions of the Press.

"What has long been wanted, not only in this office, but by thousands on the Pacific Coast. * * * It answers authoritively, in short, a thousand questions asked every day, with the past, present and future of the whole section of country included in Esmeralda and Mono counties."—*Virginia Enterprise.*

"It is a valuable compilation and one which should be in the hands of every man interested in either district."—*Alta California.*

"A vast amount of information. * * * A copy of it should be on the table of every mining operator."—*S. F. Evening Post.*

LAND! BOUNTY!! PENSIONS!!!

PATENTS!

Do you want to buy, sell or exchange lands or other property in any part of the U. S. or Canada? Are you a Soldier or Sailor, in want of a Patent? Why not obtain more Bounty or Pension? Do you want to locate Government or State Lands without settlement? Why not? When I have the well-known Approved Soldiers' Additional Homesteads, under seal of the General Land Office, and that can be located without settlement, upon any Government $1.25 or $2.50 lands, subject to homestead. The Sioux Half-Breed Scrip, for location upon unsurveyed lands.

Land Warrants and Scrip of all Kinds

For cash, or part on time. Good title given or no pay. Have you any lands with an imperfect title to sell, or choice vacant lands you know of which could be located to advantage; or claims not lawfully held, which we could contest. Let me hear from you in full, and I will do my best to inform you what is to your advantage.

I will mail you a circular explaining all, and a copy of the new Pension Law. Address, (plainly)

D. H. TALBOT,

General Land, Scrip and Warrant Broker, SIOUX CITY, IA.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co.,	Con. Virginia M. Co.,
Crown Point M. Co.,	California M. Co.,
Belcher M. Co.,	C. & C. Shaft,
Yellow Jacket M. Co.,	Utah M. Co.,
Sierra Nevada M. Co.,	Ophir M. Co.,
Silver Hill M. Co.,	Mexican M. Co.,
Sutro Tunnel Co.	Overman M. Co.,
Gould & Curry M. Co.,	

REYNOLDS, RIX & CO., Agents.
18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

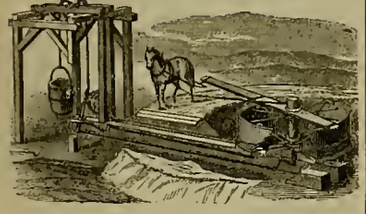
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street, San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 85 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 3 50
One man, per day	3 00
Wood, 1½ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

JUDGE WM. WEBSTER, Paymaster Mine, Reno, Nev.
LEWIS CHALMERS, Manager Exchequer and IXL Mines, Silver Mountain, Cal.
J. S. CONE, Vice-President Tehama County Bank, Red Bluff, Cal.
R. H. CAMPBELL, Superintendent Afterthought Mine, Redding; Shasta County, Cal.

For further information, apply to

D. J. O'HARRA, Reno, Nevada.

FIRE! FIRE!! FIRE!!!

ENGINE FOR SALE.

A first-class, large sized Britton Fire Engine, in fair order is offered for sale cheap. Price, $400. It is worth more than double that sum. About forty men can work on the brakes. Towns or corporations wishing a good machine should examine this engine before ordering elsewhere. Apply to

Mining Share Market.

The week has been undisturbed by any startling good or bad reports. The market has been steady, with an immense volume of business. The decline at the end of last week did not frighten Virginia City holders, which perhaps was a sign that it was caused by want of definite news rather than by fear of bad reports. No important news has come this week from the Comstock, and holders seem inclined to wait quietly for further unmistakable developments. The Solid Silver, immediately west of the Union Con. and Sierra Nevada, has attracted some attention through its sympathy with those neighbors. Julia, in the face of good news, has persisted in a fall. Last Friday it was $15.10; Tuesday it got down to $12.25. Perhaps the $100,000 contract with Sutro has had a hand in this. It is reported, however, that the decline is caused by Geo. D. Robers, who, being refused admission to the mine, immediately threw his stock on the market. The fall in Justice may probably be attributed to the Rough & Ready suit. The Bodie quotations afford a very interesting study at present. Suits are commencing in that district and make themselves felt in the San Francisco Boards. The rumored conflicting claims to Bodie created a tendency at the beginning of the week to sell that stock. The following, from the Gold Hill *News*, shows the want of good reason for such tendency: "Those who recently went from this section to Bodio to look after their mining interests, and who claim a location of the Bodie mine nine days prodious to that of those now holding the mine, have returned. They report no intended suit for contesting the title." The suit of the New York company, the Empire, against the Beehtel, Tioga and the Black Hawk has, as will be seen by reference to the quotations, affected the stock of these mines. It is stated, however, on good authority, that this suit will be only a waste of time, talcut and money. Tho *Stock Report* says: "The Empire company was organized in 1864, worked their ground until 1867, unprofitably, and then abandoned it. Judge Beehtel informs us that the abandonment was complete and final. They did not in any particular comply with the mining laws of the district, which provided a way to hold possession of their claim if they wished to. They simply gave it up in disgust, left their mill to rot away, and finally in 1875 it was sold for taxes—the mill, not the ground as the complaint implies.

The Fair Season.

The following is a partial list of the coming fairs. We shall be pleased to add to it if readers will send us the dates and locations of their respective exhibitions:

San Francisco Mechanics' Institute, San Francisco, August 13th to September 14th.

Napa and Solano district fair, at Vallejo, September 3d.

Golden Gate district fair, at Oakland, September 9th to 10th, inclusive.

El Dorado county fair, at Placerville, September 13th to 15th, inclusive.

California State Agricultural Society, September 16th to 21st, inclusive.

Sonoma and Marin district fair, at Petaluma, September 23d to 28th, inclusive.

Northern district fair, at Marysville, September 23d to 28th, inclusive.

San Joaquin valley district fair, at Stocktou, September 24th to 28th, inclusive.

Montana Agricultural, Mineral and Mechanical fair, at Helena, September 23d to 20th, inclusive.

Santa Clara valley fair, at San Jose, September 30th to October 5th, inclusive.

Upper Sacramento Agricultural Society's Fair at Chico, September 30th to October 5th, inclusive.

Siskiyou county fair, at Yreka, October 2d to 5th, inclusive.

Nevada State Agricultural, Mining and Mechanical fair, at Reno, October 7th to 12th, inclusive.

Stanislaus County Stock Growers Fair, at Modesto, October 9th to 11th inclusive.

Monterey county district fair, at Salinas City, October 8th to 12th inclusive.

Oregon State fair, at Salem, October 8th to 18th, inclusive.

Southern California Horticultural Fair, at Los Angeles, October 14th to October 19th, inclusive.

Southern California Agricultural Society's Fair, at Los Angeles, October 14th to October 19th, inclusive.

Plumas, Lassen and Modoc District Fair, at Susanville Lassen county, October 21st to 25th inclusive.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, Aug. 19th, $3,131.88; Aug. 24th, $7,912.78; Bodie, July 30th to 23d, $428,076.29; Aug. 23d, $32,800; Aug. 24th, $36,000; Aug. 25th, $15,400; Aug. 26th, $17,000; Aug. 27th, $30,000; Standard, $20,000; Aug. 25th, $21,146.23; Eudowment, $4,272.86; Manhattan, Aug. 22d $12,232.08; Tybo Con., Aug. 19th, $4,631.25; Aug. 21st, $4,636.12; Aug. 23d, $4,536.75; total for August, $52,049.90; Star, Aug. 19th $3,038; total for August to date, $11,751; Con. Virginia, Aug. 24th, $123,735.18; California, Aug. 24th. $116,713.46; Independonce, Aug. 19th, $6,177.22; Aug. 26th, $8,000; Silver Reef, Aug. 16th, $4,244 28; Ontario, Aug. 16th, $2,977.64; Aug. 17th, $2,871.87; Aug. 19th, $5,226.63; Aug. 20th, $3.019.52; Aug. 21st, $2,719.86; Aug. 22d, $2,906.03; Old Telegraph, Aug. 17th, $2,400; Raymond & Ely, Aug. 20th, $5,436.23; McCracken, Aug. 26th, $8,784.70; Christy, Aug. 28th, $5,504.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING AUGUST 13TH, 1878.

BLASTING WEDGES—Otto T. Brockhausen, Reno, Nev.

WHEELBARROWS—John Lennon, S. F.

HORSE-POWER EQUALIZERS—Lowry L. Rowland, Monmouth, Oregon.

PROPELLING VESSELS—Samuel H. Cowles and Benjamin B. B. Brewer, Sacramento, Cal.

LAWN MOWERS—Adolph H. Ran, S. F.

STOVE ATTACHMENTS—Lorenzo B. Lawrence, Monticello, Cal., and A. G. Strawbridge, Sharon, Pa.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

[Communicated.]

The Pacific Mineral Land Company.

A company will shortly be incorporated, under the above name, in this city with a large capital stock, for the purpose of acquiring and working mineral land on the Pacific coast of the United States and adjoining countries. The company will mine coal, iron, silver, gold and other minerals, sink petroleum wells, make coke and establish iron manufactories, build railroads where necessary, own and run steamers, and seek in every profitable manner to develop the resources of this coast.

A gentleman of life-long practical experience in the coal and petroleum regions of the East will devote his services to the company as President. A special feature will be made of coal, the safest and most lasting of all the minerals. Arrangements have already been made for the acquisition of valuable and accessible coal fields on the northern part of the coast, work on which will be commenced without delay. It is intended before New Year's to lay down coal of the best quality in San Francisco at lower price than has yet been done. The company will arrange for the immediate construction of large and powerful steamers suited for carrying coal, merchandise and passengers, thus ensuring the shipping of their coal at a small expense.

A sufficient working capital for all purposes will render further calls on the stockholders unnecessary, and no assessment will be levied on the stock. Every facility will at all times be offered for full examination of the company's affairs by individual shareholders. Gentlemen well and honorably known both here and in the East are interested in the undertaking, and their names are a guarantee that the affairs of the company will be conducted in a perfectly fair and honorable manner. A large amount of stock has already been applied for in this country and in Europe.

This will be the strongest company ever organized on this coast, and offers unequaled inducements for the safe and profitable investment of capital, the stability and sure rise in value of real estate being here combined with the profits of mining and manufacturing, whilst the variety of operations to be carried on reduces the risk to a minimum.

Further particulars will be announced in these columns in the course of a few weeks.

OCEAN VILLA, SANTA CRUZ.—Mr. Geo. H. Bliss, Proprietor of this flourishing watering place, offers large, well furnished rooms, single or in suites, to visitors. Also cottages for families that desire them. Grounds large, romantic and pleasant. Situated forty feet above tide water, having a beautiful view of the Bay, Ocean, City and Mountains. Premises extend to river's edge, affording rare facilities for boating, bathing and fishing. No pains spared to please guests. Address, P. O. BOX 106. Santa Cruz, Cal.

PIOCHE, Nev., Aug. 17th, 1878.

MESSRS. DEWEY & CO.—*Dear Sirs:* My letters patent for car brake through your Agency has been duly received, for which please accept my many thanks. And allow me to say that your valuable advice so kindly tendered to inventors through your MINING AND SCIENTIFIC PRESS and circulars, together with the brevity and promptness of your action in securing letters patent to applicants, cannot be too highly endorsed. Again thanking you, I subscribe myself obediently one among your many friends. Respectfully, H. H. GARRISON.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,420.94. Lewis C. Grover, President; L Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansomo St., San Francisco.

WATSONVILLE, July 20th, 1878.

MESSRS. DEWEY & CO.—*Gents:*—I was not expecting my patent so soon. You certainly kept your word when you said no time would be lost. I remain, yours truly,
W. T EASTERDAY.

LOS GATOS, Aug. 9th, 1878.

MESSRS. DEWEY & CO.—*Sirs:*—I received by express the letters patent, dated June 18th, 1878. I am very much pleased with the specification and all, for which accept thanks. Very truly yours, MILTON ROSS.

MR. W. J. WOODLEY, who took out a Canadian Patent some four years ago, is requested to call at the MINING AND SCIENTIFIC PRESS PATENT AGENCY OFFICE. Business of importance.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

And in accordance with law, and an order of the Board of Directors, made on the 16th day of July, A. D. 1878, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 304 Post street, on the sixth day of September, A. D., 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

FRANCIS P. DEVINE, Sec'y.

Office, No. 304 Post Street, San Francisco, Cal.

Gover Mining & Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of August, 1878, an assessment (No. 37,) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Monday, September 23rd, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, October 21st, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal

Pocahontas Gold Mining Company.—Location of Principal Place of Business, San Francisco, California. Location of Works, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of August, 1878, an assessment (No. 14) of One Dollar and a Half ($1,50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 9, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before we will be sold on Wednesday, the 23rd day of October, 1878, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors M. C. SOUTHARD, Sec'y.

Office, Room No. 9, 411½ California street, San Francisco, California.

Office South Comstock Gold and Silver Mining Company.

NOTICE.—The annual meeting of the stockholders of the South Comstock Gold and Silver Mining Company, for the election of Trustees and the transaction of such other business as may be presented, will be held on Monday, the 19th day of August, 1878, at two o'clock P. M. of that day, at the office of the Company. Transfer books will be closed on Saturday, August 10th, 1878, at the hour of 12 M. of that day.

J. M. BUFFINGTON, Secretary.

Office—Rooms 3 and 4, second floor, No. 309 California street, over Aetna Insurance office.

Telegraph Copper and Silver Mining Company.

Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gopher Mining District, Calaveras County, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1,) levied on the seventeenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No Certificate.	No. Shares.	Am't.
Howland, W H	Not issued	1350½	$ 40 52
Jones, C C	Not issued	5640	169 20
McCrea, Wm	Not issued	4999	149 97
Bollinger, J C	Not issued	17,166	514 98

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of July, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 2, 528 California street, San Francisco, California, on Monday, the ninth (9th) day of September, 1878, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. T. MILLIKEN, Secretary.

Office, Room 2, No 528 California street, San Francisco, California.

Vigorit Powder Company.—Location of works, California City, Marin County, State of California. Location of principal place of business, City and County of San Francisco, California.

Notice is hereby given that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 1) of fifty cents (50c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No 1, 109 California street, in the City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the twelfth day of September, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the second day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expense of sale.

JAS. W. BAKER, Sec'y.

Office, 109 California street, Room No. 1, City and County of San Francisco, California.

Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 28, 1877.

MESSRS. DEWEY & Co.—*Dear Sirs:*—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for fire brick, and for a smelting and condensing furnace, making six patents I have obtained through your patent agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours,
GEO. R. EVANS.

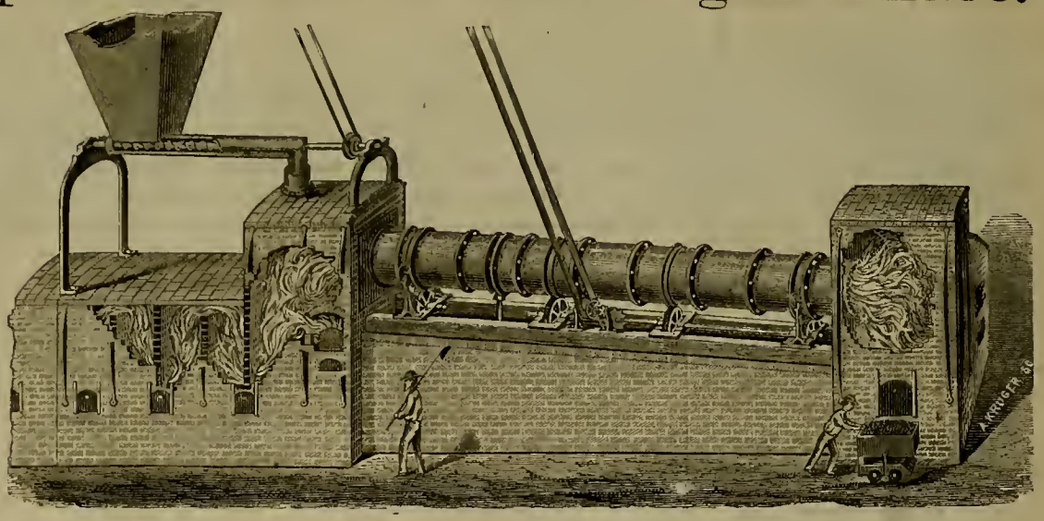
ROBERT M. CONE, 226 Fremont St., S. F.

Howell's Improved White Roasting Furnace.



This cut represents the most improved construction of this unrivaled Furnace, the superiority of which, over all others as regards cost and capacity, as well as the economical and thorough oxidization and chloridization of ore, is now generally conceded.

In this Furnace, as covered by the Howell and White patents, are combined the three acknowledged requisites for the thorough and economical roasting and chloridization of ores.

First.—Continuous progression through and discharge of the ores from the furnace—while in the meantime they are, by being constantly showered through the heated air and gases within it, exposed in the greatest possible degrees to their reducing action.

Second.—Subjecting the ores to this showering process any length of time that may be necessary, according to the character of the ore, for its thorough reduction. In passing through the furnace it ordinarily falls about 1,000 feet, all the time in direct contact with the flame.

Third.—Increasing the heat on the ores as they are progressed through the furnace.

In this respect this furnace excels all others, as in none of them are combined all these essential requisites. It will chloridize the most refractory ores up to from 80% to 98% of their assay value, depending upon their nature and grade

The first cost, as well as the cost of operating it, is less than that of any other furnace of equal capacity.

It requires no especial skill in management that cannot be readily acquired by any one capable of conducting an ordinary silver mill.

We manufacture various sizes adapted to a five, ten or twenty-stamp mill, and will furnish plans by which any competent mill man can erect and operate it.

This furnace having the full or partial brick lined cylinder, embraces the devices covered by the patent to John Howell, as well as the original devices covered by the White patents. It has been erected and operated successfully at the following mines in California, Nevada, Arizona and Montana, viz: Camanche, Jefferson, Leopard, Utah, Star, Navajo, Grand Prize, Peck, Tiptop, Hackberry, Independence, Endowment and Alice.

At least ten of them are now in active and successful operation, in some cases reducing ores of the most refractory character.

These facts are a sufficient attestation of the merits of this furnace.

The undersigned, with Mr. John Howell, are the sole owners of the Howell patent, and they have perfected arrangements with him, and also with Mr. J. M. Thompson, who is owner of an interest in the White patents, and as such is possessed of as full and perfect rights and powers under the same as the patentee himself, by which they have acquired the exclusive right to manufacture these furnaces for the Pacific States and Territories. We hereby **caution** all parties against purchasing the same from any others but ourselves, or the said Howell or Thompson, as we shall prosecute all parties infringing upon the same. For particulars, price and terms, address

RANKIN, BRAYTON & CO.,

Pacific Iron Works, First and Fremont Sts., bet. Mission & Howard, San Francisc

Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Ranch.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for an illustrated paper containing information about Shasta County and these lands, to the proprietor of Reading Ranch.

EDWARD FRISBIE.

Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the "Elephant Ore Stamp." The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse power Engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

DEWEY & CO.
American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E.COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Pateuts and Assignments; Every legitimate branch of Pateut Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to ahundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Pateuts, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columhia, Canada, Norway, Swedcn, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuha, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are ohtainable.

No models are required in European countries, hut the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliahle and permaueutly established.

Our schedule price for ohtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsihle agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has heen done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentahility of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may he lost hy extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential hy us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of pateuted articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our owu office, and all facilities for producing fine and satisfactory illustrations of inventions and machiuery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in hringing their valuable discoveries into practical aud profitable use.

(NARROW GAUGE.)

New Route to Alameda, San Jose and Santa Cruz.

SUMMER ARRAGEMENT, 1878.

COMMENCING SATURDAY, JUNE 1ST, 1878, AND until further notice, trains and boats will leave San Francisco at the new Ferry Landing, Market street:

5.00 A. M., via Alameda Ferry, daily, for Alameda, West San Leandro, West San Lorenzo, Mount Eden, Alvarado, Hall's, Newark, Mowry's, Alviso, Agnew's, Santa Clara, San Jose, Lovelady's, Los Gatos and Alms.

9.20 A. M., via Alameda Ferry, daily, for Alameda, Newark, Alviso, Santa Clara, San Jose, Los Gatos, Alma and all Way Stations, connecting at Los Gatos with Coolgrove's stages for Oil Wells, Patchen, Mountain Charley's, Martin's Ranch, Scott's Valley and Santa Cruz, or via Wright's Summit, Hotel de Redwood, Comstock's Mill, Mason's Grove, Soquel to Santa Cruz. Also connecting at Los Gatos with Blabon's stages for Saratoga and Congress Springs. (Dinner at Los Gatos).

4.20 P. M., via Alameda Ferry, daily, for Alameda, Newark, Santa Clara, San Jose, Alma and all Way Stations.

☞On Saturdays only stages will connect with the 4:20 P. M., train at Los Gatos for Santa Cruz and Saratoga. Returning, leave Santa Cruz at 4 A. M., Monday (breakfast at Los Gatos), arriving in San Francisco at 10:15 A. M.

EXCURSION TICKETS

Will be sold from San Francisco to San Jose and return, $3; to Los Gatos and return, $3.75; to Saratoga and Congress Springs and return, $4.50.

☞These tickets will be sold ONLY on SATURDAYS and SUNDAY MORNINGS.

The RETURN TRIP ticket will not be good for passage after the Monday following the date of purchase. Procure tickets at New Ferry Slip, foot of Market street, and at Park Street Station, Alameda.

FERRIES AND LOCAL TRAINS

VOLUME XXXVII Number 10.

Willard's Desulphurizing Furnace.

This furnace, which is represented by the accompanying cut, is one of the most interesting exhibits at the Mechanics' Fair, and deserves the attention, particularly of mining men, which it is receiving. The furnace has for its object the thorough decomposition of sulphuret, arsenical, antimonial and telluride ores. It consists, as is seen in the figure, of a cylindrical chamber, which is made, according to its dimensions, of either wrought or cast-iron. This chamber or retort has a false bottom, somewhat on the principle of a Bessemer converter, which separates it from another chamber into which a blast of air is blown. The false bottom is perforated in order to allow a finely-divided current of heated air to pass up into the ore to be treated. The furnace is so arranged that charging and discharging are very easily performed, and the operation may without difficulty be made entirely automatic.

The operation of the furnace is as follows: The ore to be treated is mixed with about half its bulk of some finely-divided carbonaceous material, as straw, shavings or sawdust. These are used in preference to coal dust or charcoal dust because it is necessary that the mass retain moistnre longer than these last-named materials are capable of doing. The mixture is thoroughly moistened with a solution containing about as much salt as sea-water. The bottom of the retort is heated np to a dull red, no higher, and then the mixture, prepared as above, is charged into the furnace. The blast is now turned on below the false bottom, throngb which the air, heated by circulation over the hot bottom, passes np into the ore. The fire under the retort is now allowed to go out. The process continues for a length of time varying with and determined by the nature of the ore. When the roasting is over, the ore comes out a very porons, friable mass which has certainly every appearance of a dead roast. Its mechanical condition is such as to prepare it admirably for further treatment by any process, whether it be leaching or amalgamating.

After a little study it will he seen that this process is quite different from the ordinary roasting processes now in vogue. The presence of the carbon and hydrogen of the material mixed with the ore as above, and of the water of the salt solution, prevents not only the partial fusion of the ore, but also the formation of non-volatile oxides of antimony, so difficult to treat when once formed. Without careful analytical investigation it would be fruitless to attempt an explanation of the chemical reactions that take place dnring the operation.

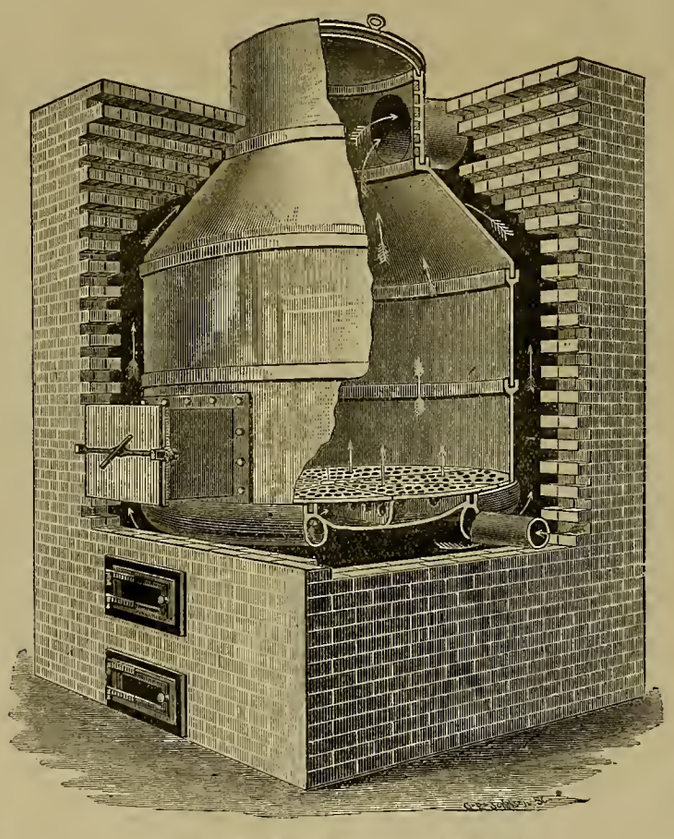
The Cost of the Proceee

In San Francisco has been calculated at present prices of fuel, labor, etc., for all the processes gone through with from the time the ore is delivered at the works to its appearance as retorted amalgam, *i. e.*, including crushing, pulverizing, roasting, amalgamating, etc. The calculated cost for all these operations is $5 per ton. The cost for roasting alone, including mixing, fuel, labor, etc., is from $1 to $1.50 per ton.

The following data furnish a basis for the calculation of cost in any district. The labor required to run six furnaces, each working a charge of one ton at a time, is as follows: For roasting and firing, one man; to assist in charging and discharging, one man; for mixing, one man. The last two of these men, the mixer and charger, may be dispensed with if automatic mixing and discharging apparatus is used, and then one man alone can run the furnaces. The capacity of each of these furnaces is from four to eight tons per day, according to the nature of the ore, low grade ore being more easily treated. All this, then, may be run by one man. So much for the labor. The air blast is driven in by a blower which requires from three to five horse-power. Soft wood for fuel, about one cord to 20 tons of ore, is required for heating the retort. Salt in small quantities must he obtained for the solution. Five per cent. by weight of saw dust is mixed with the ore.

Many object that the saw dust is difficult to obtain. If it is not obtainahle, any woody refuse, such as straw, shavings, leaves, brushwood, will do. Sawdust, however, seems best adapted for ready uniform mixing with the ore. It can be readily produced by means of a very simple machine which was originally invented to facilitate the extraction of dye-stuffs from various dye-woods.

Mr. Willard has already treated to the satisfaction of all concerned, many samples of different ores. We will mention a few only: gold-bearing pyrites from Sierra Co., auriferous arsenical pyrites from Plumas, auriferous pyrites from Butte, arsenical pyrites from Drytown, Amador, samples from Meadow Lake. Maurice Dore, Esq., and Messrs. Gleason and Pauson, may be referred to as having tried the process. The latter gentlemen stated that their Meadow Lake ores on which Mr. Willard tried his furnace, were among the most difficult that they had. Yet, so well satisfied were they with the results of the trial, that they have bought and shipped the only ton furnace that Mr. Willard had on hand.



WILLARD'S DESULPHURIZING FURNACE.

According to the Denver, Colorado, *Tribune*, chlorinations with the roasted ore gave from 88% to 99% of the assay value, the latter being the more usual.

Mr. Willard has two furnaces at the fair, a large and a small one. With the latter he exhibits his process, operating on small batches of ore. He uses a Baker pressure blower, which, however, gives more blast than is necessary. His largest furnaces will handle about a ton at a time. Those desiring further particulars will do well to visit the fair and see the operation. Mr. Z. A. Willard, the inventor, may be addressed at 1031 Market street, San Francisco.

Aug. 27th, Jack O'Harra and three others attempted to jump the Black Hawk ground at Bodie. They were fired upon, and O'Harra was mortally wounded.

A black walnut imbedded in a rock taken from the Black Star coal mine fifty-two feet below the surface is on exhibition at the bank of Anaheim.

Kelly's Transom Adjuster and Lock.

Mr. James Kelly exhibits at the Fair a device for operating windows and transoms, which he recently patented through the Mining and Scientific Press Patent Agency. The device is intended for operating window sashes, transoms, etc., which are suspended so as to turn about an axis, and which may be situated out of convenient reach. Everybody knows how much trouble it is to open or close a transom sash, for instance, over the door. You always have to get a step-ladder or a chair to do it, and it will never stay in the position you want it. It persists in either remaining wide open or close shut.

Mr. Kelly's device is intended to remove this objectionable feature, and admit of the transom being opened or closed from below and in keeping it in any position desired.

The sash is journaled or hinged on a bar, to which is attached a short lever connecting with a long one, which reaches downward. This long rod is attached to a lever, the long end of which projects through a slot in the window or door frame. By moving the knob on the end of this lever up or down, the sash is swung in either direction, and by screwing the knob up a little on a movable plate the sash is held in any position. The device can be put inside or outside of the frame. If put inside, nothing is exposed but the knob and escutcheon. The arrangement is the best thing of the kind yet invented. By turning the knob a little, the transome sash is locked in any desired position. The knob may also be arranged so that by pulling the knob out and moving it, the window may he opened or closed, and by letting go the knob, a spring pulls the knob in and a pin in the outside escutcheon catches on one of the holes in the inside escutcheon, thus locking the sash in any position. Mr. Kelly may he addressed for further information at No. 1005 Natoma street, near Eleventh.

The Mines and the Courts.

Suit has been commenced in the United States Circuit Court by the Stedtfelt Furnace Company against the Tip Top Mining Company, for infringement of patent.

In the suit of B. F. Baker vs. the Pioneer Mining Company, to recover $100,000 damages for breach of contract, judgment was given, in the Twelfth District Court, in favor of the plaintiff.

It is said that a special meeting of the Board of Trustees of the Justice Mining Company has been held, to finally settle the dispute between the Justice and Alta mines, by ratifying the pending compromise. The terms of settlement are represented to be that Alta shall pay Justice $50,000 and give it the use of its shaft; and that in consideration thereof, Justice waives all ground covered by the famous dollar deed, and withdraws all suits.

In the appeal of the Occidental M. & M. Co., situated on the Brunswick lode, in Silver Star Mining District, Storey county, Nevada, from the adverse decision of the Commissioner in the case of the Sutro Tunnel Co., vs. the Occidental Co., Secretary Schurz has decided in favor of the former, affirming the decision of the General Land Office. When the Occidental Co. applied for a patent in 1875, the attorneys of the Sutro Tunnel Co. protested, on the ground that this lode was within 2,000 feet of the tunnel, or within the district to be drained, developed and improved by the tunnel; and in August, 1876, these attorneys filed a statement that this lode has been actually drained by the Sutro tunnel and rendered workable, testimony being taken at the local office. The Commissioner decided that while the evidence was not conclusive, still a *prima facie* case had been made out in favor of the tunnel company.

After reviewing the evidence in regard to the creation of the water flow in the Occidental tunnel, coincident with the extension of the Sutro tunnel, the secretary holds that the quoted testimony does not show conclusively that said mine has been drained, benefited or developed by said tunnel, hut it does show, *prima facie*, that said mine has heen drained, although the conclusion is reached only hy tracing the effects to their natural causes. As to the right claimed by the Sutro Tunnel Company, to construct a tunnel to the Brunswick lode on the grounds of discovery, the secretary decides adversely, because he holds that this can he done only to the lode discovered hy the tunnel, and the Brunswick was discovered earlier. In his decision, Williamson construed "develop," as used in the law, as one and the same thing with "discover." The secretary decides differently, and holds that under the clause in the law giving the right to construct a tunnel to the mines developed by the tunnel, a royalty can be claimed from the Brunswick lode; aud such a condition must he inserted in the patent for the mine to that effect. While this insertion will he made upon a *prima facie* showing by the Sutro Tunnel Company, the secretary lays down the doctrine unequivocally that benefit to the mine must be fully and conclusively shown in fact, before royalty can be claimed from any mine.

Meteorological Summary for August.—The report of the U. S. Signal Service officer, of San Francisco, for the month of August is summarized as follows: The mean hight of barometer for the month was 29.90; mean temperature, 58.2; mean humidity, 79.4; prevailing winds, southwest; highest barometer, 30.108; lowest, 29.732; highest temperature, 73°; lowest, 32°; monthly range, 21°; greatest velocity of wind 32 miles per hour; total number of miles traveled hy wind, 8,780; total rainfall, .00 inches. Rainfall in August during former years: 1871. .02 inches; 1872, .00 inches; 1873, .08 inches; 1874, .00 inches; 1875, .00 inchcs; 1876, .01 inchcs; 1877, .00 inches.

Academy of Sciences.—Monday evening, September 2d, the California Academy of Sciences held a regular meeting. Among the donations to the cahinet were some ores from the Black Warrior mine of Arizona, by G. A. Treadwell, and a specimen of a new auriferous mineral by Thomas Price. A number of books, periodicals, exchanges and some lithographic plates were also received for the library. S. B. Christy read a paper ou the ocean beach placer mines.

CORRESPONDENCE.

We admit, unendorsed, opinions of corres pondents.—EDS

Truckee and Vicinity.

EDITORS PRESS:—This town is situated in the easteru end of Nevada county, Californiа, aud near the westcrn line of the State of Nevada, on the Truckee river, 14 miles from its source, at the northern end of Lake Tahoe, about two miles from Donuer lake, and on the Ceutral Pacific railroad; altitude about 6,000 fcet. The town is a livcly little place, contains a population of about 2,000 inbabitants, polls nearly 500 votes, has enrolled 220 school children, good public school with three teachers, two churches, two hotels, a great number and variety of stores, livery stables and shops. The principal industry is the lumber and wood business. There are a great many saw-mills in tbe town and vicinity.

Truckee Lumber Company.

The saw-mill and sash and door and furnituro manufactories of this company are situated in the town of Truckee. The business is owncd and managed hy E. J. Breckell and W. H. Kruger. Capital invested, $60,000. They work about 200 men. Wages, $3 to $5 per day. The capacity of the mill is 50,000 feet of lumber per day. The timber is procured on the Truckee river, and floated down to the mill. Large quantities of sashes and doors, window-blinds, moldings and shingles are manufactured by this company, also furniture that, for elegance of finish and quality, is not surpassed by any manufactory on the coast. To guard against fire, the proprietors have erected an engine house and purchased a good fire engine with 2,000 feet of hose, constructed two water tanks, 30,000 gallons each, aud organized and uniformed their employees into a fire company. The upper story of the engine house is furnished np for a reading room for the benefit of the employees, in which they have placed a well-selected library. The bell in the dome is one of historic fame, being the old vigilance bell that struck terror to the hearts of the evil doers of San Francisco during the stirring times of '56.

Pacific Lumber and Wood Company.

This is an incorporated company, having its principal place of business in Truckee; President, J. D. Lord. The business is managed by the Superintendent and principal owner, Mr. F. Burckholter, who is also a banker in Truckee. The mill is located at Boca, 10 miles east of Truckee, on the Central Pacific railroad. The logs are delivered to the mill by a narrow-gauge railroad, extending into the timber four miles south of Boca. The mill and logging camp are connected by telephone with the principal office at Truckee.

Other Mills.

There are many other mills in tho vicinity. The Banner Mill and Lumber Company, eight miles distant, owned by Martin & Leach; also the Shaffer mill, the Ellen mill, the Richmond Brothers' mill and many others, all making daily large amounts of lumber. The principal market is the State of Nevada and Territory of Utah, the Comstock coming in for a very large share.

Lake Tahoe.

By invitation of J. F. Moody, proprietor of Moody's Hotel in Truckee, and one of the proprietors of Moody & Huntington's stage line, we took passage in one of their magnificent coaches at 7 o'clock in the morning for Lake Tahoe, distant 15 miles. The road runs along the banks of the Truckee river the whole distance, and is one of the most pleasant and inspiring drives on the Pacific coast. The scenery is grand; high rugged mountain forests of tall pines and symmetrical fir trees, the pure atmosphere, the limpid mountain river, transparent as glass, in which can be seen so plainly the speckled beauties that they look as though floating in mid air, which, together with the hundreds of other attractions, not the least of which is the smooth and evenly-graded road, makes the time to Tahoe City, two and a half hours, seem very short.

Tahoe City

Is at the head of the Truckee river and the outlet of the lake. The river is at that point about 50 feet wide, and has an average depth of five feet. The velocity of the water is said to be five feet per second, which would make the discharge from the lake per 24 hours about 23,400,000 gallons. There is a dam at the outlet that when the gates are closed the surface of the lake can be raised about four feet.

The Grand Central Hotel is located at Tahoe City, which is quite an imposing structure, and was full to overflowing with visitors and tourists, who seemed to be enjoying themselves greatly at this charming resort. The town is situated on a high bluff at the northern extremity of the lake, and commands an extensive view of one of the grandest pictures ever opened to the view of mortal man. The lake lies at an altitude of 6,218 feet above the level of the sea. It is 23 miles long and 15 miles wide. It is in the form of a parallelogram, lying northeast and southeast, partly in Nevada aud partly in California. At a distance of three miles from shore, its depth is from 1,000 to 1,200 feet. The greatest depth yet found is 1,800 feet. The water is so transparent that trout and other objects can be seen at the bottom where the depth is from 80 to 100 feet. Owing to the rarity of the atmosphere the water has little buoyancy. It is hard work to swim in the lake. Nothing is ever seen floating on the lake but boats or rafts of logs in transit. Stray logs, drift-wood, and even shingles soon sink. The bodies of persons drowned in the lake never rise or are never seen again.

Lake Taboe is the great sanitarium of the Pacific coast. Those suffering from catarrh, bronchitis, incipient consumption, and kindred diseases, will receive more benefit from a visit to this place than the whole *materia medica* can afford. It possesses climate, scenery, and means of health, giving pleasure to the careworn and debilitated far ahead of any other place of resort it has fallen our lot to visit. The overworked business man is bound to forget his cares while free. The scenery is too grand, the air too quieting and dreamy to allow business ties to absorb the attention.

The Steamer Niagara.

This splendid little propeller, the fastest passenger boat on the lake, is commanded by Capt. D. W. Avery, and is always in waiting to convey tourists around the lake upon the arrival of Moody & Huntington's stage from Truckee in the morning at 10 A. M. The excursion around the lake takes about six hours, during which time landings are made at McKenney's, Emerald Bay, Yank's, Rowland's, and Glenbrook. Pleasure seekers have only to place themselves in charge of Capt. Avery, when they may dismiss from their minds all care or uneasiness, and give their whole attention to the beautiful scenery of tbe lake and the grand surrounding mountains, as whatever their destination may be, he will carry them promptly to the point and in good time. While using his utmost endeavors to contribute to the comfort and pleasure of his guests, Capt. Avery never forgets to attend to business. W. G. A.

Truckee, August 20th, 1878.

The Coal-Gas Works of the Napa State Insane Asylum.

EDITORS PRESS:—Thinking that such information may prove interestiug to some of your readers, I send you a description of the Asylum gas works, recently erected by Mr. Smedberg.

Construction.

The works consists of:

a. Two settings of oue irou retort each; the retorts heing D shaped, 24″x13″ inside, and 7′ 6″ long over all.

b. An atmospheric coudenser of four-inch wrought iron gas-pipe.

c. A Pelouze and Audouin condenser, with uickel plated differential guage.

d. A cast-iron scrubber, containing a column of coke eight feet high.

e. Two cast-iron lime purifiers, with cast-iron covers, and nickel plated rotary release and test valves. Also a twin of rotary four-way valves, hy which either purifier may be worked aloue, or both be worked together in either sequence.

f. A gasbolder 18 feet diameter by 10 feet deep, having a storing capacity of 2,500 feet.

g. A glazed experimeutal meter for testing burners. The whole is as tight as could be wished, and does not create the slightest smell or annoyance of any kind.

II. Performance.

The works were laid out to supply 250 burners; but in point of fact an average of only 130 were lighted three hours per night iu June. The gas made during the month was 30,300 cubic feet, being an average of 1,010 cubic feet per nigbt, or 2 8-10 cubic feet per burner per hour.

The material retorted is a mixture of 80% of Australian "Sydney Wallsend" caking coals, and 20% of Australian "Hartley Shale," yielding 5 32-100 cubic feet per joint pouud, or 11,916 cubic feet per ton of 2,240 pounds.

It requires 20 pounds of unslaked Clipper Gap lime to purify 1,000 cubic feet; so that one barrel of say 240 pounds purifies 12,000 cubic feet of gas.

The labor required for gas-making is so slight that it is performed by the firemen who stoke the boilers for tbe engine, etc.; and no special hand is added to attend to the retorts and purifiers.

The quality of the gas, as might be inferred from such high percentage of Hartley Shale, is very fine, standing by Sugg's illumiuating power meter at the equivalent of 26 staudard photometric caudles. The burners give a stiff, white, smokeless flame, and the gas is so efficiently scrubbed that little ammouia can reach the gasholder.

While tar reaches the *inlet* of the Pelouze and Audouin Condenser, this beautiful machine throwing the tar-bubbles against opposed plates, (like an egg agaiust the wall) breaks them up and delivers all the tar to the tar well, while the gas passes on absolutely free from this troublesome impurity.

As the works are now using only one-half the coal that was expected, we do not get coke enough to heat the one retort which is at work; and we were therefore obliged to use seven cords of oak wood as supplementary fuel during June.

III. Cost of Lighting.

A.—EXPENSES OF GAS MANUFACTURED.

June, 1878, 30,000 cubic feet registered.

Coals.—4,560 lbs of Wallsend at $12.32 per ton of 2,240 lbs	$ 25.08
1,140 lbs. of shale, at $32 per ton of 2,240 lbs	16.28
Total for coals	$ 41.36
7 cords of oak, as extra fuel, at $8	$ 56.00
2½ barrels of lime, at $2	5.00
Estimated wear and tear, say 50 cents per day	15.00
Total	$117.36

Thus it will be seen that each burner cost us one cent per hour.

B.—WORKING AVERAGES.

Gas per pound of coal	5.32	cubic feet
Gas per long ton	11.926	" "
Gas per barrel of lime	12.120	" "
Gas per cord of extra fuel	4.328	" "

In conclusion it may be stated that the works are perfect in every mechanical detail; beside being compact, symmetrical and carefully finished in every part. We have not had the slightest hitch, stoppage or difficulty of any sort since the works were first lighted, four months since. With one man's additional labor, we could send out 5,000 cubic feet per day, with the same wear and tear, and have a surplusage of coke instead of buying wood for extra fuel, as at present. Respectfully,

T. M. MARTIN,
Engineer in Charge.

The foregoing statement meets with my approval in every particular.

E. T. WILKINS, M. D.,
Resident Physician.

Metallurgy of Silver.

The following extract serves to illustrate the advances that have been made in metallurgy as in every other industry. It is taken from the London *Jeweler:* The ancient method of extracting silver from its ores was exceedingly crude, requiring a period of several months in the operation. In the old Mexicau process the ore was ground to a fine powder in circular paved pits, called arrastras, hy means of large stones attached to a shaft drawn round by mules, resembling the manner in which clay is still mixed in some of our brickyards; water was added and the argentiferous mud was piled into heaps and left exposed for a considerable time to the action of the atmosphere. It was then mixed with common salt and copper pyrites, called magistral, by driving mules backward and forward over the mass. Mercury was added, which combined with the silver to form amalgam and the dross washed away. The excess of mercury was removed by squeezing the amalgam in canvas or chamois-skin bags. This method is said to have been invented in the year 1557, by a miner named Bartholomew De Medina.

Nearly all the modern improvements are mechauical modifications of detail, but the advantages of machiuery are so great that as much can now be accomplished in a few hours as formerly required several days. The usual method at present adopted is to roast the silver ores containing sulphur with from 10 to 12% of common salt. About 1,000 lbs. of ore constitute a charge. The heat volatilizes the sulphur, and the chlorine unites with the silver. After the ore has swelled into a spongy condition it is thoroughly sifted and placed in barrels holding 1,000 lbs. each; mercury is added and the barrels are revolved for about 20 hours. Modifications of this process are adopted in some cases to shorten the time; the mercury is sometimes delivered in a fine spray while the ore is kept hot. In order to separate the mercury the amalgam is dried, rolled into balls, and placed in hermetically-sealed retorts. The and mercury is driven over coudensed, and the silver is cast into hars (called pigs) for shipment.

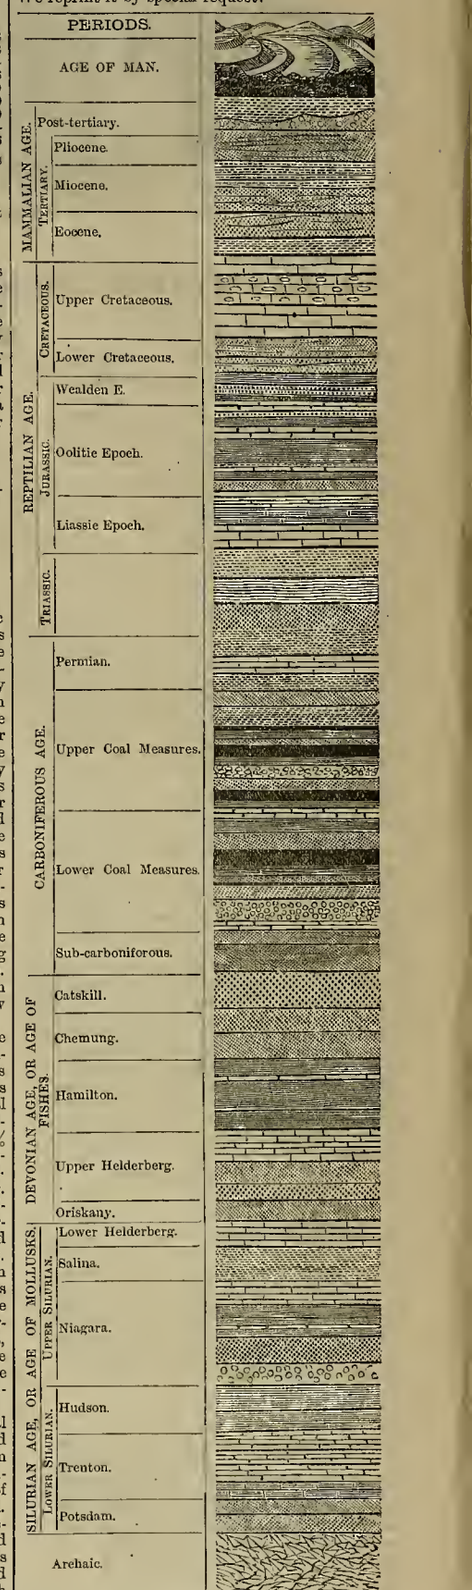
Efforts have been made to effect the removal of the silver without the aid of mercury, and several methods of solution and precipitation have been devised. Zieroofel's process is exceedingly ingenious. The mass, consisting of sulphurets of silver, copper and iron, is roasted. The sulpburet of silver also suhsequently becomes sulphate, and if the heat were continued would be reduced to the metallic state; as this is not desired the roastiug is discontinued and the silver is fouud as a soluble sulphate, which is then dissolved in hot water. The silver is precipitated by means of copper plates. The principal objectiou to this method of reduction is that the presence of certain impurities, such as antimony or arsenic, cause the formation of insoluble salts, which retain a portion of the silver.

Von Patera's process consists in converting the silver into a chloride, by roasting with salt. It is then dissolved iu a cold dilute solution of hyposulphate of soda. It is next precipitated in the form of sulphate, by the addition of polysulphide of sodium, and finally reduced to the metallic state by melting in a furnace while exposed to the atmosphere. All the processes of solution are comparatively modern, and possess advautages in several ways over the old amalgamation method.

FUNGUS ON SUNFISH.—Seth Green has lately beeu examiuing the perch and sunfish that have died in great numbers ou Lake George. He finds that the disease is a fungous growth on the gills, resembling pulmonary consumption, aud warns the people against eating the fish.

The Earth's Strata.

The adjoining diagram, showing the strata of the earth in their order, is taken from Dana. We reprint it by special request:



UNITING THE HUDSON AND EAST RIVERS.—The feasibility of the important project of uniting the Hudson and East rivers by means of a great ship canal is again attracting attention. The subject has been talked about at different periods for half a century, but nothing was ever accomplished till Gen. John Newton made surveys of different routes and submitted his report to the Government. Congress then voted to make an appropriation of $300,000 for the purpose of commencing the work. Gen. Newton states in his official report that the probable cost of making a navigable channel, with 15 feet of water, would be $2,777,571, and with 12 feet of water the cost would be $2,270,825. As soon as the right of way has been secured to the United States Government from owners of land along the Harlem river, and some other preliminary matters are arranged, it is expected that this great project will be commenced. That it would promote the commerce of New York there can be no question.

MECHANICAL PROGRESS.

Construction of Manholes in Steam Boilers.

Robert Brigg, in the *Journal of the Franklin Institute*, gives the following suggestions on the use of cast iron bonnet manhole rings on the cylindric portion of a boiler when a manhole is wanted on such a surface. First, within some reasonable limit of curvature, it can be affirmed that a bent manhole is just as good for service as a flat one. For shells of three and one-half feet in diameter and above, this is absolutely true. Double clips are always better than one, but with one clip it is practicable to make as good a joint as any steam engineer may desire with such bent manholes, and a rubber, or, what I prefer, a hemp-plait gasket filled with red and white lead, with a little litharge if in a hurry. Secondly, for all places, both curved and flat, a wrought iron manhole ring is better than a cast iron one. It is safer, easier to make up to the boiler, and when the difference of weight is considered, it is nearly, if not quite, as cheap as a cast iron ring piece. Care should be taken to make the wrought iron rings heavy enough. Most of the failures to use them have been occasioned by *saving* in material; but material enough to give strength to the boiler, where it has been weakened by the manhole, is ample for all purposes, and the dimensions to supply this strength are easily computed. Suppose the manhole to be 10×14, and imagine a shell 7-16 thick. The weak place of such a hole is the 14-inch way, if it is longitudinal to the cylinder. There have been removed from the shell $14 \times 7\text{-}16$ or $6\frac{1}{4}$ square inches of material, whence, for bare strength, only 3 7-16 square inches of iron should be found at each end of the manholo. $2\frac{1}{2} \times 1\frac{1}{4}$ give $3\frac{1}{4}$ square inches of section, and adding to the width $\frac{3}{4}$ for the rivet holes in the ring, becomes $3\frac{1}{4} \times 1\frac{1}{4}$. This dimension is the least that should be used in this case, and it will be found ample for the jointing of the manhole plate. Little deduction should be made in case the hole is made transverse to the shell. Here the curvature of the shell begins to tell on the strength of the ring, and in such case double clips should be used for the plate.

Wrought iron manhole rings should always be riveted to the inside of the boiler.

TESTING THE STRENGTH OF CEMENT.—At the Paris Exposition there is on exhibition a machine for testing cement. To the upper end of a suitable cast-iron framing is hinged a beut lever, one end of which carries a heavy counterbalance weight. The other (and shorter end) has suspended from it the frame in which the block to be tested is placed. The lower end of this frame is acted upon through a link by a toothed quadrant, which can be partly rotated by a handle driving the worm which engages it. By means of a segment at the back of the machine, and a pointer driven by a small stud on the bent lever, the maximum attained elevation of the counterbalance weight is shown, and therefore by suitable marks the strain sustained by the block is at once known. It will readily be seen that the pulling motion is extremely even and gradual, so that the block cannot get broken by jerks. The two bolts which untie the two halves of the frame in which the specimens are tested are left very slack, by which arangement the full test load can be applied, and at the same time the counterbalance weight can only drop a short distance when fracture takes place. The machine is simple and efficient, and a large number of manufacturers and users of cement have them daily employed at their works.

KEEPING ON THE SCALE.—The Royal Laboratory Department in the Royal Arsenal, Woolwich, have practically abolished the operation of giving a smooth surface to shot and shell by the use of the lathe. The method of casting these projectiles of exact size and smooth exterior was first carried out on account of the expense which would be saved by the abolition of turning, but a still greater advantage has been found in the superior hardness of the unturned shells, the one-tenth of an inch of the outer skin which it has been usual to turn off the Palliser projectiles being equal in strength to one-third of the interior surface. By reducing the thickness of the walls the shell is thus enabled to contain a much larger bursting charge without any diminution of penetrative power, and the whole mass proves to be more cohesive and serviceable in what may be regarded as its natural skin than after the material and chemical changes wrought in its constitution by the friction of the lathe.

A STEEL PROPELLER.—A Philadelphia exchange says: The new iron steamship *City of Columbus* left Chester yesterday for New York on its trial trip. The new vessel is equipped with the latest improvements in the shape of a propeller wheel. In the *Macon* an iron propeller was placed, and in the *Savannah* the wheel was made of brass, but in the *City of Columbus* the propeller is made of the finest steel. The *Savannah* was made to eclipse the *Macon* in point of speed, but is thought that the *Columbus* will beat them all. The vessel was finished throughout before leaving the dock, with the exception of the carpeting and furniture.

A Novel System of Brick Burning.

Quite a startling novelty in brick burning is reported from England and is said to be in successful operation. The kiln, in its construction, resembles a single tunnel, about 108 feet long, 8 feet wide, and 11 feet high to the crown of the arch. The bricks from the machines are carried on a belt to a strong iron wagon with a clay top, standing close to the machine, and when 5,000 have been set in position, it is taken to the inlet end of the kiln, which contains nine wagons, and as the load of green bricks is admitted at the inlet end, one is passed out at the other end ready for the purchaser. The fires operate from four small furnaces in each side of the kiln in the centre of the length, while those from the centre to the outlet end are cooling, and those from the centre to the inlet end where a small chimney stands, are getting treated, and which in their turn are subjected to the direct action of the furnaces; four to six hours complete the burning operation. It is surprising, considering the small structure, the quantity that can be passed through, 15,000 to 20,000 per twenty-four hours, which are burnt at a cost of only 3d. per 1,000, and the time occupied in the passage of the bricks through the stages of drying, burning, and cooling does not exceed three days. The iron wagons do not suffer from the heat, cold air being circulated freely under the clay bottom, but is excluded from penetrating above it. The kiln is quickly erected, costing about $2,500, including wagons and all appliances for working it. If used for temporary purposes three-fourths of its cost is readily portable; in working, wheeling on harrows is avoided. There are no stacks to build and plaster, and the waste of bricks that are used for that purpose avoided; the bricks only being handled once in a green state very much preserves the quality, and about 20 per cent. of the labor used in brick making is avoided; and small orders for special shaped bricks can be supplied in three days.

NEW PROCESS OF SHIPBUILDING.—A new mode of constructing iron or steel ships has been invented by Mr. J. Humphrys, general manager of the Barrow Shipbuilding Company in England. By his mode of construction, which is on the longitudinal system, whereby the maximum strength is obtained by the minimum weight, the dependence on skilled manual labour which is now so eminently characteristic of the present method of shipbuilding is altogether obviated, the fabric being most readily and simply constructed by the employment of channel sections of iron or steel, and the riveting effected by mechanical rivets, such as Tweddle's. The fabric is erected in permanent buildings specially designed for the purpose, whereby the present expensive system of frame, floor-plate bending, hand templating for the skin and other plating, shoeing and ribboning, hand riveting, etc., all of which are dependent on skilled manual labor, are all dispensed with, mechanical appliances and unskilled labor taking their place, the result being that a stronger, lighter, and less expensive fabric is produced, and a considerable saving in the time required for building is effected.

AMERICAN SUCCESS AT PARIS.—A dispatch from the Paris Exposition says: In the award of prizes at the Paris Exposition, the United States agricultural exhibit has received a diploma of honor and the United States educational exhibit a gold medal. Of the eleven objects of art offered by the Agricultural Society of France for exceptional merit in agricultural machinery in the recent field trials eight have been awarded to American inventions. Dr. Edward H. Knight, the American juror of Class No. 76, has been authorized to announce the awards. They are as follows: McCormick's binding reaper, Wood's binder, Osborne's binder, Johnston's harvester, Whitley's harvester, Deere's gang plow, Diedrick's hay press, the Chicago hay press. The above eight prizes are independent of the medals of the exhibition.

A NEW OIL WELL DEVICE.—An invention which is proposed to drill oil wells without a derrick; to pump the sand out without removing the drill; to test and pump the well, after it is completed, without removing the tubing, is said to be completed by two Pittsburghers. The *American Manufacturer* says: The drill is a hollow pipe and is studded with diamonds, which obviate the necessity of removing the same to sharpen the tools, as is the case with steel drills. It works with a rotary movement instead of the chopping motion of the drills now in use. The pipe being hollow, the sand pump runs inside of it, and when the well is completed the pipe is used for tubing, the oil being pumped through it. If the drill does all that the inventors expect of it, they have a good thing.

AMERICAN LOCKS ABROAD.—According to a Paris journal, the locks displayed in the American Department at the Exhibition are incomparably finer and more perfect in every way than anything of the kind ever before seen in Europe, at any rate in France.

HYDRAULIC RAILWAY IN PARIS.—A Girard hydraulic railway, the wheels sliding on the surface of a film of water on the rail surface, is being built in the Park of the Trocadero, Paris, and will convey visitors to the Exhibition. It will be 400 meters long.

SCIENTIFIC PROGRESS.

Prof. Haeckel on the Echinodermata.

Among the many distinguished corresponding members of the San Francisco Microscopical Society is Prof. Haeckel, the illustrious German biologist. At a recent meeting of the society, the subject of the lower forms of marine life was under discussion, and the society listened to a translation by Secretary Clark of a short paper on "The Alternate Generation of the Echinodermata," sent by Prof. Haeckel.

"The palingenetic development of the *Echinodermata*, ordinarily known as metamorphosis, which leads to important inferences as to their race history, is to be considered as a genuine alternation of generations, and especially for this reason, that the two succeeding generations are destroyed in order to make possible the change into one another by a single transformation.

"The first generation, the 'nurse,' or so-called larva, is a solitary, bilateral, limbless individual or 'person,' which consists of only one piece of antemera, and possesses the greatest resemblance to true worm larvæ. On the contrary, the second generation, the perfected echinoderm, has the ground plan of a symmetrical, five-sided pyramid, and consists of five antimera or parts; it forms a true stock or cormus, which is composed of five articulated, worm-like, bilateral persons. When this cormus originates within the nurse by budding, a multiplication of antimera occurs, whereby from one antimer five arise. This origin can be interpreted only as a non-sexual reproduction, not as a mere transformation.

"The true nature of these genuine alternate generations is clearly shown by those sea-stars in which the body remains free from the five, or more, independent arms, and the central disk, which barely unites the latter in the middle, exists almost as an independent body. These are *Ophidiaster*, *Chætaster*, *Brisinga*, etc. Particularly interesting in this relation are most species of the genus *Ophidiaster*, or *Linckia*, from which several specimens are exhibited. Here the single arm, which possesses the morphological value of an articulate worm, is freely detached from the disk, and every arm forms, by regeneration, both the central disk and the four remaining arms. The speaker showed, with numerous specimens of the four species of *Ophidiaster* selected, all the various stages of this reproducing process, and discussed the significance which these so-called comet forms of sea-stars possess for the morphological interpretation of the same.

"Therefore, we should take as the oldest stem form of the *Echinodermata* the asteroidea, from which, as diverging branches, have developed *Ophiuridea*, *Crinoidea* and *Echinoidea*. In the last the centralization of the whole cormus is carried farthest, and from them the *Holothuroidea* have arisen. Thus the *Holothuroidea* stand most distant from the original form of the *Echinodermata*—the *Asteroidea*.

DANGERS THAT BESET SUBMARINE CABLES.—Every one who has at all studied oceanic telegraphy perfectly, understands the dangers to which the shore ends of the communicating wires are exposed from the action of currents, the anchors of ships, etc. But the general idea prevailed that once the cable was laid in the gloomy depths of the ocean it was in safety. Such, however, is not the case, for the inhabitants of those regions seem to resent the intrusion. In many cases, owing to the inequalities of the bottom of the sea, the wires can not rest wholly on the bed, but in some places hang in festoons. Then they are liable to accidents from the larger denizens of the sea, among which we may particularly mention the sun-fish (*Orthagoriscus*). That peculiar but little known animal is nearly circular, of a brilliant silvery white, and at night emits a powerful phosphorescent light, whence its name probably arose. When swimming it turns round like a wheel, and moves with great rapidity. It grows to an enormous size, often attaining four feet in diameter, and some of them are said even to reach eight feet. Specimens have been caught weighing 500 pounds. It is found in all seas from the Arctic to the Antarctic Circle. Where the tail is in ordinary fishes, this curious creature has a sort of flattening in its circular shape from which bony spines project. Not long since, an interruption occurred in a cable, and on examination it was found that it had been penetrated by one of the caudal spines of the sun-fish. Even when the wire lies quiet at the bottom it is not safe; for a species of marine weevil attacks the gutta-percha and gradually destroys the conductivity. But the most curious instance of damage inflicted on a cable is that which lately befell the one from Portugal to Brazil. A fault having been found, the tests were applied and the precise spot indicated. The wire was fished up and was discovered to be broken. In one of the ends was entangled a large whale. The monster was covered with parasites, and, in attempting to free itself from its tormentors, had broken the cable, and then managed so to twist itself in the coils of one end that it was held fast a prisoner, and, not being able to rise to the surface for air, was drowned.

DEPTHS OF LAKES.—The Bavarian *Courier* publishes an interesting comparative statement of the depth of lakes. Among European lakes the Achensee, in the Tyrol, heads the list. At some points the depth of this lake amounts to 2,500 feet. The greatest depth of the lake of Constance is about 975 feet, that of the Chiemsee about 458 feet, and that of the Walchen and Konigssee, 611 feet. The measurements made about 1870 at the Dead Sea showed that at its deepest part its depth is 1,836 feet, but if we consider that the level of this lake is already 1,394 feet below the level of the Mediterranean, then we find that the total depression in the soil here amounts really to 3,230 feet. The lake of Tiberias is extremely shallow in comparison; on its eastern part the average depth is only 26 feet while on the western side it lies between 19 and 22 feet. In lake Baikal depths have been found which for a lake are utterly astonishing. In the upper part of the lake the depth is 10,800 feet, (about the hight of Mount Etna) but downward the bottom constantly descends, and near the opposite bank the depth amounts to 13,230 feet. The depth far exceeds that of the Mediterranean Sea, which at its greatest part measures only 7,800.

HOW GRAPES RIPEN.—According to *Comptes Rendus*, St Pierre and Magnien have arrived at the following conclusions in regard to the changes which grapes undergo while ripening. During the process they evolve carbonic acid in darkness as well as in light, when exposed to the air or placed in an indifferent gas. The amount of oxygen evolved in air is always in excess of the oxygen taken up; this has been remarked in the case of observations extending over a long space of time. Grapes can absorb or give off water according as they are placed in a moist or dry medium. As the change goes on the acids decrease in amount, while the quantity of sugar increases. The acids and the glucose are carried to the grapes by the sap. Here the acids are slowly consumed, while the sugar increases in point of concentration, and at a still later stage the sugar itself is consumed.

A DOUBLE EXPEDITION TO THE NORTH POLE.—From a communication recently received at the Navy Department, it appears that Mr. James Gordon Bennett contemplates a double expedition to the North Pole, one vessel going by way of Behring's Straits, and the other by way of Spitzbergen. He has been in consultation with Petermann, the great German geographer, and other Arctic experts abroad, and now proposes to fit his well known yacht, the *Dauntless*, for an additional Arctic expedition, putting in her an auxiliary engine and screw, and otherwise making her complete for an expedition by way of Spitzbergen. The *Jeannette* is on her way to San Francisco, and will pass through Behring's Straits early next year. Her owner will spend no less than one hundred and twenty thousand dollars on the *Jeannette* expedition.

ARTIFICIAL PRODUCTION OF CRYSTALS OF SILICA.—At one of the *seances* of the French Academy, M. Daubree presented a method of obtaining crystallized silica in the dry way. For this purpose the tungstate of soda is employed by M. Hautefeuille, who obtains at will the silica crystallized either in the form of tridymite or of quartz. It has been well known, from the researches of G. Rose, that the phosphates and the tungstates could be made to serve this purpose. But it has been demonstrated by M. Hautefeuille that the tungstate exercises a far more energetic action in this respect than the phosphate; so that at a very moderate temperature, it may be employed to produce a number of the more or less fusible silicates that occur in nature.

MOSANDRUM.—A dispatch from St. Louis says: In the sub-sections of the Association for the Advancement of Science, a paper by J. Lawrence Smith of Louisville, was read this afternoon announcing the discovery of the oxide of a new metallic element, which the professor intends to call "mosandrum." This is the first element ever discovered by an American. It is found in the mineral samarskite, from North Carolina, and resembles the metals of the cerinm group.

HYDROGEN.—E. Varenne and E. Hebre have found that for making pure hydrogen gas a solution of 10 parts of bichromate of potash and 5 parts of sulphuric acid in 100 parts of water acts as an absorbent of all gases which can be mixed with hydrogen produced from impure materials. By the use of this mixture hydrogen free from the compounds of arsenic, antimony, sulphur, carbon and silicon may be obtained.

NATURAL SCIENCE IN EDUCATION.—The motion of Sir John Lubbock, providing for the addition of elementary science to the subjects for which grants are made under the English education code, has been defeated. Dr. Lyon Playfair, who supported it, said they only wanted to give children the opportunity, at present denied them, of gaining elementary knowledge of common things.

A RECOVERED FUNGUS.—Rediscovery of a lost *Sphæria* is noticed by the bulletin of the Torrey Botanical club. This fungus, the *S. barbirostris*, was discovered by Dufour, in the department of Landes, France, over forty years ago. Since then no specimen has been found until lately, when Mr. J. B. Ellis rediscovered it on some maple bark at Vineland, New Jersey.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

OUR MINING PROSPECTS.—The dearth of mining news from this county has lately heen very noticeahle. It is encouraging to see the following in the Alpine *Chronicle* of Aug. 24th: Since the formation of this county a more favorahle opportunity for mining men to obtain valuahle mining property has never been presented than Alpine can offer at this period in her history. Is is not owing to the harrenness of our mountains that Alpine is not more favorahly known in mining circles, hut it is owing to the ignorance and had management of those who have attempted to develop some of the hest miniug property in the county, and the failure of the score of processes for working ores that have been tried here since '65, wheu the Rivot furnace was erected at Markleeville. We have had introduced here at this late day a process that has heen emineutly successful in reducing the most rehellious ores in Alpiue county, and at an insignificant expense per ton. Through this process the Advance company has heen enahled to make regular shipments of bullion to San Francisco for several weeks past. Now that we have a practical reduction process, there is encouragement for mining men to take hold of mines in Alpine and develop them. With a mill at the mine, to save the expense of transporting the orc, $10 ore would pay a profit to the mine owner and enahle him to develop his mine with its prodnct. There is scarcely a mining claim in Alpine couuty that would fail to produce $10 or $15 ore from the croppings. In all the mining districts of the county there is an ahundance of wood and water, thc latter sufficient to run hundreds of stamps, and mining enterprises can he managed here with a reasonahle outlay. The county will recuperate under the continued success of the new reduction process at the Advance mill, and those having interests here are already feeling encouraged, and steps are heing taken hy San Francisco parties to inangurate a mammoth mining enterprise in the Silver Mountain district early next spring, wheu other claims at Silver mountain will be started up. With our mines placed in charge of superintendents who thoroughly understand silver mining and are economical in their mauagement, we are confident that Alpine will soon fall in line as a hullion producing county. A large numher of our claims are now subject to relocation, and there are many valuable mining properties here that can he had on good terms hy parties wishing to develop them. Alpine has one hullion-producing mine, and a judicious outlay would soon give us a score of them.

HYDRAULIC MINING.—William H. Naileigh, Daniel L. Naileigh and William Pennison, of Virginia, have heen for the past two months engaged in preparing for hydraulic mining near Hangman's hridge, on the Carson river.

AMADOR.

CENTENNIAL.—*Ledger*, Aug. 31: A hody of extra quality ore was uncovered on Tuesday. There are 2,000 tons on the dump ready for milling. While the mill is heing erected, the lode will he explored 100 feet deeper. That the stock-holders have confidence in the mine is proved hy the fact that a deliuquent assessment list has never heen published in connection with the property.

MONTIRICHARD.—A force of 20 men is pushing work on the reservoir, and its completion is close at hand. The reservoir will cover an area of five acres, and will cost at least $2,500. This reservoir will prevent further interruptions at the mill. This mine is off the mother lode and the managers are cautious in developing it. In order to discover what they have ahead they will soon sink 100 feet further. The present stopes are not yet exhausted.

ITEMS.—The Oneida mine has, since its opening in 1869, produced $1,391,750. Its yield this year has been $123,386. The last Downs' clean-up aggregated $3,008, an average of ahout $40 per ton. It is estimated that enough rock is in sight to keep 10 stamps running for a year. Manon's creek mining claim at Sutter turns out a higger crop of lead than gold. The Talisman mill has been engaged to crush rock from the Tucker Hill claim of Sutter Creek. Teams are at present employed in hauling ore to the mill.

CALAVERAS.

CHILI GULCH.—*Chronicle*, Aug. 31st: Hoey & Silter's mine and mill are in full operation. The battery was set in motion Wednesday. The pay chute has heeu struck in the mine, levels run and breasts opened, and it is expected that gravel can be taken out fast enough in the future to keep the hattery in constant operation. The prospects of the mine are first rate. There is any amount of gravel to he had, and no lack of indication that it will pay well for mining and milling.

GARIBALDI.—This mine has heen sold to Kellogg and Garland. Kellogg is a San Francisco capitalist and minor. Garland is proprietor of the sulphuret works in Sutter Creek, and owner of large mining intcrests in Amador. The price for the mine was $4,000, cash down. The property was sold hy John Etchevery & Co., and is generally known as the "Butcher John mine." It is understood that work will be commenced immediately. The Good Hope hoisting works, and Garland's 18-stamp mill, are, it is reported, to he put upon the mine.

SCARCITY OF WATER.—W. W. Cook, of the Maison de Sante, has heen compelled to shut down, and several others must soon follow his example and wait for the rains. All the great tunnel mines will continue in operation, however. Duryea, Brown & Co., Hoey & Sliter, the Rough Diamond, Johnson, Querel & Co. and others will not even reduce their working force, the quautity of water requisite to keep the several mills in operation being comparatively small.

EL DORADO.

GOLD DEPOSITS.—*Mountain Democrat*, Aug. 31st: The late strike in the Gold Deposit mine is giving to the miuing interest of this section such an upward "lift" that in all probahility it will cause the opening of several mines which are well knowu to be rich but for lack of capital have for some years laid idle. This strike has not heen kept a secret, as too often has been the case in this place, hut all who have desired to do so have heen invited to examine the mine and the ore tbat has heen extracted. This is as it should he, and will do more good to the county than many secret strikes which the people had lost confidence in. This lode is a true fissure vein with well defined walls, and by miniug men is considered to have all the requirements of a good mine. The company is now running a tunnel along the side of the lode, and are grading the ground for the erection of boisting works, etc., which, it is said, they inteud to push to completion as soon as possible, when they will commence sinking.

FRESNO.

MINING RESOURCES.—*Expositor*, Aug. 29: The mining resonrces of this county have heen receiving considerahle attention of late, owing principally to the recent valnable discoverics made in the Sierras, on the north side of the San Joaquin. Prospectors are ranging all through the mountains, from the vicinity of Fine Gold Gulch to the Bodie mine, and scarcely a week passes without sevcral new and promising gold and silver-hearing quartz ledges heing discovered. The discovery of the apparently rich veius of silver-bearing ore, in the vicinity of what is know as "Pine City," has led to the discovery of another, and apparently richer series of mines near the head waters of the San Joaquin, in what is known as the "Lake District." Following up the discoveries, other ledges have heen found still further west in the vast slate helt that extends along the summit, east of the Palisades. A numher of rich veins of silver ore have recently heen discovered ahout 20 miles east of the Oro Fino mines. The newly discovered ledges are apparently a continuation of the hase metal veins found in Inyo and Mono counties. The discovery of these veins will cause a thorough search to he made through the mountain range for hidden mineral deposits.

MONO.

THE Mono *Press* is indefatigahle in collectiug reports from the mining claims. Similar energy displayed in some other counties might increase the numher of our dividend-payiug mines.

PACIFIC TUNNEL.—Bodie *Standard*, Aug. 28: C. W. Mills commenced work last week. The tunnel is now in over 200 feet and a good stratum is coming on the face. Thirty tons of ore on the dump will mill ahout $65 per ton. An air shaft, nearly 150 feet from the mouth of the tunnel, followed a good ledge for 60 feet, the full length of the shaft.

SOUTH BODIE.—The shaft is down 80 feet. A douhle compartment shaft, three and a half by seven feet, will be driven down, the timhering of which will be commenced at once. Three shifts will be put on and the work driven ahead as rapidly as possihle. Hoisting works will arrive for this claim inside of 20 days. The working capital is $20,000. Twenty feet from the surface there are several stringers, and in the hottom a very good stratum is coming in.

BENTON.—The Indian Queen mine, though located in Nevada, is properly one of the Benton mines. Since the company have taken hold of this mine, they have taken out over $300,000 worth of huilion, making over $500,000 worth of ore extracted in all. They have also erected a splendid four-stamp mill from the profits, and under Howell's supervision, two dividends of fifty cents per share, were declared. Enough machinery is now on hand to enlarge the mill to eight stamps, and should tbe mine continue to look as favorahle as it now does, the enlargement will soon be made. The company will then he ahle to produce twice as much hullion, and stockholders can look for numerous dividends. During a thirty-five day's run just made 166⅔ tons of ore was reduced to a milliug cost of $27½ per ton. The ore thus reduced (deducting 7¼ tons of custom ore), amounted to $23,235; average assay, $145.44 per ton, and amalgamated, 92½ per cent. The ore contaius about 35 per cent. lead, and ahout 10 per cent. other base metals. It is of a very refractory nature, thus makiug the working of it to a high perceutage, a very difficult task. Nearly thirty meu are employed in the mill and mine, and upon the whole, the Indian Queen mine is perfectly estahlished.

ORIENT.—This claim is nortb of the California and south of the Old Dan. The shaft is down 26 fect. A vein formation of 2½ feet of good payiug quartz was cut in the sbaft. Thc mine has been sold to San Francisco parties who will incorporate it, and commence operations at once.

MCCLINTON.—This week the shaft has been sunk 8 feet, making a total of 370 feet. The ledge of good milling ore in the hottom is 3½ feet wide.

SAND BANK.—This claim was sold Aug. 26th, hy Louis Lewis to San Francisco parties for $5,000 in coin, and 50,000 shares of stock. The shaft is down 135 feet, and a good ledge followed almost all the way from tbe top. Hoistiug works have heen ordered.

RED JACKET.—This shaft is down 40 feet. When down 30 feet, the south drift was started, and is now 7 or 8 feet. Very fine ledge matter was encountered in this drift. A good ledge is coming in the hottom of the shaft.

SILVER QUEEN.—Parties have taken hold of this mine, and will prosecute the work vigorously. The shaft was sunk 100 feet, and then drifting for the ledge commenced. The drift is now in 75 feet.

SILVER HILL TUNNEL.—This is a very recent location. The tunnel is in 70 feet, and in a short time three shafts will be put on. The locators are Thos. Steere and A. Bah.

GENERAL BATTERMAN.—This shaft was sunk 32 feet some months since and during the past week was resumed, and it is now down 40 feet.

CALIFORNIA.—This mine was sold a few days since hy Louis Lewis to Cliuton & Gurnie, of San Francisco. The shaft is down 103 feet.

BERTIE MAY.—Have heen timhering the shaft during the past week. It is down 40 feet and sinking will he resumed in a few days.

POORMAN.—The owners commenced work ou this claim, and the shaft has beeu sunk only a very short distance.

MONO & CROSS.—This claim is on Silver hill. It has a ledge four to six feet wide. It is ahout eight feet between the walls and the formation is soft porphyry, mixed with clay and quartz. On each of the walls there is nearly a foot of clay. It is thought to he a true fissure vein.

NEVADA.

NEW ENGLAND MINE.—*Herald*, Aug. 31: This mine is a new euterprise, and the work of paospecting has just commenced. On thc New Englaud proper uothiug is known of the lode to a greater depth than 150 feet. There is every reason to helieve that south of thc perpendicular shaft, where the first hoisting works were constructed, there is a pay chute equal to anything yet developed. The work now being done is confined to the 450 level, and ahove it a great deal of fine ore has heen taken out. The size of the ledge increases and the quality of the rock seems to improve very much in the 450 level. On this level a tunnel has heen run we should say over 100 feet, and an "upraise" made for air, and for the purpose of stoping. The "upraise" has heen run a distance of 80 feet from the tunnel through a body of ore from two to five feet thick, and of as good a quality as any taken out. A winze was started from the 350 level to connect with the "upraise," aud in this the same body of ore is found. It is estimated that there is now enough ore in sight to keep the mill running six months. With a force of five men on a shift there is sufficient ore now heing taken out to keep a 20-stamp mill running all the time. The new crushing mill is doing good work and gives entire satisfaction. It is a 10-stamp mill, witb all the latest improvements. The appliances for saving sulphurets are very complete, and are showing fine results.

THE SMITH MINE.—*Transcript*, Aug. 31: Sinking is to he commenced iu the Smith mine, at the Half-Mile House, in a few days. A large force of men are to he employed, and the work pushed ahead as rapidly as possihle. The indications of a rich claim there are indisputahle. What little rock has heen taken out already is found to be very rich, and the ledge is said to be an extensive one.

MEADOW LAKE.—Grass Valley *Union*, Sept. 1: The stuhhorn Meadow Lake ore have at last succumhed. Willard's new roasting process in connection with Gleason's method of amalgamation, have ohtained 92⅞ of the gold from the ores. The Truckee Smelting Works will be at once removed to Meadow Lake.

ITEMS.—New diggings of gold-hearing gravel have heeu hrought to notice recently in the vicinity of Round mountain, ahove Nevada City, and are attracting considerahle attention. It is supposed to be a hranch of the Blue Tent lead. A party of 32 persons have located 640 acres, named their company the Atlanta and intend to start work soon. The San Francisco Copper mining company, at Spenceville, is now shipping 30 tons of pure copper per month, and during the coming fall will increase their shipments to 50 tons per montb. Messrs. Edmunds & Co. have just completed the working of three tons of sulphurets from the New York Hill mine, at their works on the Union Hill road, which yielded $1,070, or $356 per ton. The Pioneer Reduction Works, of Gold Flat, are tunneling for water. Hoisting machinery for the Moore's Flat Gold mining company has heen ordered at the Nevada foundry. A fine ledge, five feet thick, is in sight in the Hudson incline. The Manzainta mine is to be resurrected.

PLACER.

QUIET TIMES.—*Dutch Flat Forum*, Aug. 29: Matters in mining circles are quiet at present. The hydraulic mines are all idle with exception of the Lekamp mine, where the usual number of men are still at work. The other companies will commence fitting for the next season in a month or six weeks. At Lowell Hill the various tunnels are being pushed steadily ahead, with good indications of soon developing something of value. Several new claims have heen located on Bear river during the past six months. On some of them work has heen commenced, and is heing vigorously prosecuted. Reports from Little York say that the gravel is improving in quality, and hig returns may he looked for next season. At Gold Run everything is quiet waiting the return of water. The indications are very favorable for the next season.

PLUMAS

GOPHER HILL.—*National*, Aug. 31st: The Plumas Ditch Co. have had a good season's run of water, and their pipes have heen running in the Metcalf and Haycock claims on Gopher Hill, for some months. Within the past few weeks they have cleaned up, and the result so far, amounts to the neat little sum of $28,000. Some hedrock is yet to be worked over, and it is thought that at least $3,000 more will he taken out hefore the season's work is over. The company have a vast amount of ground yet to work, and the ditch commands a section of mining country which is almost inexhaustihle.

SHASTA.

FURNACEVILLE.—Reading *Independent*, Aug. 29: W. C. Boylan, Superintendent of the Tehama M. Co.'s miue, better known as the Donkey mine, gives the following facts: They have now on the dumps at least 1,200 tons, which will assay on the average $40 per ton, and may mill $25 to $30. The ore is not as spotted as in the other mines, but earries a more uniform grade. The ledge where they are now at work is 14 feet wide, hut may not average this clear through. The company are now taking steps toward the early construction of a mill.

COPPER CITY.—Good reports come from all the mines, the Extra, Potter, Northern Light, Pittshurg and Wiuthrop. The ledges are turning out to he true fissure veins. As they sink deeper they grow more clearly defined and yield richer ore. The Extra company have shipped over $3,000 in silver hricks ahove 900 fine and a numher of tons of cement copper. The Potter ledge is eight feet wide and gives assays as high as $40 per ton gold and silver (no copper). The Pittshurg has hut just commenced. The arrangements at the Winthrop are said to he most systematic. Superintendent Springer will have things so convenient that one man will he able to convey 50 tons per day from the miue to the mill. French capitalists have heen examining the region with a view to finding a location that will justify the erection of large reduction works.

SIERRA.

ITEMS.—Nevada City *Transcript*, Sept. 1: Thanks to the energy of Col. L. E. Cram and Wm. Hanley, the Golden Star Gravel M. Co. have developed a very rich mine. They wait for water at present. The Masonic mine, under the management of Chas. Rice, is said to he paying well. Wm. Mansen is developing the Pliocene with all possible speed.

SAN BENITO.

QUICKSILVER.—Gilroy *Advocate*, Aug. 31: A ledge of quicksilver has heen lately discovered within three miles of the Stantonville camp. It is ahout 18 inches wide and assays as high as 20% and 25%. It has heen named "The Mariposa."

NEVADA

NEVADA ITEMS.—The lately incorporated Jersey M. Co. have commenced operations in Jersey district. The indehtedness of the Mayflower mine has heen settled, and the mine will he started. The Pioche West Extension machinery is being taken dowu to he shipped to Andy Fife, Long Valley. The owners of the Great Unknown location, are sinking with three shifts, night and day toward the ledge. The mines in Lake district, ahout four miles west of Ward, are to have a 20-stamp mill. Operations are soon to he commenced among the copper ledges in the old Howard district. Tom Andrews has discovered, thirty miles southeast of Cherry Creek, a mountain of ore assaying from $45.50 to $2,000 ton. The other day, Harrison in Vizau's old claim near Osceola, washed out $300 in dust and nnggets. It is said that the work of putting up copper smelting furnaces at Rohinson will he commenced immediately. A. H. Ruse has struck a fine ledge near the Blue Jacket mill, Bull Run country. All along the quartzite helt, which is easily traced from Ruhy Hill to Secret Cauyon, prospecting is reported lively. At the Cherry Creek mill, Tom Andrews' fabulous ore assayed no higher than $98.82. Two important strikes have lately heen made in the leading mines of Ruhy Hill. The Richmond was first to the front with an important development, and now comes well authenticated rumors of a splendid find on the 1200-foot level of the Eureka Consolidated. If true, and we can hardly douht it, this is the deepest point at which ore has heen found in this district. It is douhly important from this fact, that it attends largely to assure the future of Eureka. It is thought that the Leopard chute has heen struck in the Hussey. The negotiations of some Virginia City capitalists for the purchase of the Mountain Bride mine in Paradise mountains, fell through on account of a dispute in regard to the ownership of part of the grounds. Reports from the Railroad district mines are good.

WASHOE DISTRICT.

CON. VIRGINIA.—Gold Hill *News*, Sept. 4: Daily yield of ore 200 tons, which is heing crushed as fast as it is extracted. Repairing the consolidated shaft is making steady prog-

ress at the rate of five feet per day. Sinking the C & C shaft is progressing at the rate of two feet per day. It is now down 17 feet below the 2050 station. The rock in the bottom is still hard blasting and the flow of water apparently stronger than ever. The situation in the mine is virtually unchanged for the week.

CALIFORNIA.—Daily yield, 250 tons of ore, keeping the Battery mill steadily running. The ore stopes going northeast on the 1750 level still continue to show well. The joint Ophir winze on the north line of the mine has reached the 2000 level, at which point a joint station is being cut out preparatory to drifting southward to connect with the C & C shaft. The flow of water at the bottom of this winze will be driven through the diamond drill hole by means of a donkey pump, to the Ophir south drift on the 2000 level and will then be taken to the surface by the Ophir pumps. The repairs to the Con. Virginia shaft are making steady progress, the heat still being intense. The rate of progress is about five feet per day. Sinking the C & C shaft is going steadily forward, the bottom being in hard blasting rock and the flow of water still very strong. Whenever any accident or delay occurs to the pumps, it always requires an extra strong exertion to keep the water from flooding the shaft.

YELLOW JACKET.—Sinking the new shaft is making the best of progress. It is now down 1,740 feet, the sinking averaging four feet per day. The drift south on the 2400 level is in 231 feet, the face in favorable vein matter and perfectly dry.

CON. IMPERIAL.—The west crosscut on the 2400 level is still advancing in favorable vein matter, carrying quartz and some ore.

UNION CON.—The chamber for the joint winze on the Mexican line below the 1600 level is completed, and the sinking of a winze was commenced last evening. The north drift on the same level is being pushed energetically ahead, the face in clay and porphyry. It is now in 626 feet. Retimbering the crushed portions of this drift is making good progress.

WARD.—Sinking the main shaft is being pushed ahead with all the speed possible, the bottom in good blasting ground and the flow of water giving but little trouble. It is the intention to push the shaft downward with all the speed possible, so as to complete a connection with the south drift on the 1800 level of the Julia mine.

UTAH.—Sinking the main incline below the 1150 level is progressing at the rapid rate of four and one-half feet per day, the bottom in good working ground. The northeast drift on the 1150 level is being steadily advanced, the face in soft, easy working ground. A large air receiver has been put in at the 1150 station.

GOULD & CURRY.—The east crosscut from the foot of the joint Savage winze on the 1900 level is making good progress, the face in blasting ground. Repairing the main south drift on the 1900 level is making good progress. Sinking the main incline is making slow progress on account of the great heat.

VERMONT CON.—Sinking the shaft is progressing at the rate of three and one-half feet per day, the bottom still being in vein porphyry mixed with streaks and bunches of quartz and clay.

HALE & NORCROSS.—The pumps continue to show a steady gain on the flow of water, but have not yet reached the 2100 level. The pumps run steadily at the rate of six and one-half strokes per minute.

NORTH CON. VIRGINIA.—Sinking the shaft is making the best of progress, the bottom still in very hard blasting rock. The plans and specifications have been submitted and the contract let for the manufacture and erection of splendid new hoisting works. The works will be erected over the old ones so as not to impede the sinking of the shaft. The new hoisting machinery will be the most perfect and powerful on the lode.

OPHIR.—The south winze below the 1900 level has reached the 2000 level, at which point a station is being opened preparatory to drifting. Sinking the main incline is being driven vigorously downward, the bottom in good blasting ground and the flow of water giving no trouble whatever. A pump tank is being put in at the 2100 station.

BELCHER.—The repairs to the pumping machinery are completed and the pumps working splendidly. Sinking the main incline has been resumed and is making good progress. A crosscut has been started east from the bottom of the winze on the 2160 level to prospect the ore vein at that point. A drift south from the same point has also been started to connect with the south winze for prospecting and ventilating purposes. The south drift on the 2360 level is in 227 feet, at which point a crosscut east has been started. A crosscut is also being run directly opposite the air shaft.

BULLION.—Sinking the main incline is making the usual excellent rate of progress, the bottom still in splendid quartz affording low assays of both gold and silver. The east crosscut on the 1700 level is rapidly advancing, the face still in porphyry carrying streaks of quartz. The face of the west drift on the 2000 level is in soft porphyry carrying streaks of quartz and clay. The seepage of water is still light.

BEST & BELCHER.—The north drift from the Gould & Curry on the 1900 level has been again started up and is making good progress, the face in hard blasting rock. This drift is now in 205 feet north of the Gould & Curry line. The east drift on the 1900 level from the bottom of the joint Con. Virginia winze is also making good progress, the face in porphyry carrying streaks of favorable-looking quartz. It is now in 93 feet.

TROJAN.—The south drift on the fourth station level is being driven vigorously forward, the face still in quartz of a good character. Several crosscuts have been run on this level, all of which show quartz and some good ore. The drifts on the third and second stations are showing well. The new air connection on the third level greatly benefits the air circulation in that portion of the mine.

SAVAGE.—The pumps are still slowly gaining on the flow of water, but have not yet been able to reach the 2100 level. Preparations are being made to sink a winze below the 2000 level to the 2100 and 2200 levels. Otherwise no change to report.

SUTRO TUNNEL.—The face of the tunnel is now in a distance of 20,500 feet, at which point the tunnel has been temporarily stopped on account of the necessity of using the air pipes and drilling machinery for driving the south branch of the tunnel running to connect with the Julia shaft, which is now well under way and is being pushed ahead with great vigor.

OVERMAN.—The south drift from the bottom of the winze on the 1600 level is making fair progress, the face partly in hard and partly in soft rock, which requires careful timbering. The east and west drifts on the same level running to meet each other are both making good progress, the face of each being in good blasting ground.

LADY WASHINGTON CON.—The north drift on the 1300 level continues to advance, running parallel with the ore vein, the face in porphyry and clay mixed. The prospects are excellent when crosscutting the ore vein shall have been decided upon.

SIERRA NEVADA.—This mine has been not only the topic of conversation in every circle, but the center of expectation as well. On Saturday evening, last, a drift was started at a point 100 feet below the 2100 level. This drift had to be started in the bottom or underside of the winze, so that several feet of the drift amounts to nothing more than open cut. Soon after commencing the drift, the poor ore in the bottom was penetrated, and that which was richer began to show itself. By the time the drift was in 10 feet the entire face was in rich ore; at the distance of 13 feet, three average assays of the face and sides gave the following yield: No. 1, gold $115.12, silver, $341.10, total $434.92. No. 2, gold, $211.04, silver, $399.80, total $510.84. No. 3, gold $131.10, silver $242, total $373.15. Later in the day an average of five assays from the sides and face gave $610. Early this morning the drift was again visited by a large number of mining men and experts, all of whom took samples. Some of the richest specimens assayed high into the thousands, while a fair average of the assays of the ore, rich and poor, in the face of the drift, ranged from $300 to $500 per ton. The preparations for the permanent working and development of the new bonanza are being forwarded with all the dispatch possible, and a road is already being opened to the Sacramento mill, situated just above the hoisting works, for the purpose of giving the ore a milling test at the earliest day possible. The best experts that we have on the Comstock, now begin to look upon the development of a new bonanza in this mine as an almost foregone conclusion. Sinking the new upright working shaft below the 1700 level is being pushed ahead with all the speed possible.

LEVIATHAN.—The north drift on the 750 level is being pushed ahead with all the vigor possible, the face in the clay and black dyke lying next to the ore vein. The face of the drift shows frequent streaks of the quartz of a very lively healthy character. The south drift on the same level is also making good headway, skirting the west edge of the ledge, the streaks of quartz wherever cut showing splendidly. The hoisting capacity of the main incline machinery has been largely increased.

MEXICAN.—Sinking the joint Union Con. winze below the 1600 level was commenced last evening and is making good progress. The joint Ophir east crosscut on the south line of the mine on the 1600 level is making good progress, the face in hard blasting porphyry.

CHOLLAR COMBINATION SHAFT.—The broken machinery reported last week has been replaced with new, which will be in better condition for service in a day or two more than ever before. The north drift running to connect with the Sutro tunnel is advancing at the rate of five feet per day, the face being in ground which requires constant timbering. It is now in a distance of 195 feet, and will have 170 feet yet to run to connect with the tunnel. The water has risen over 200 feet in the shaft, but gives no trouble.

SILVER HILL.—The greater portion of the past week has been consumed in making some necessary changes to the machinery. These are now about completed and work will be resumed in all parts of the mine at once.

ORIGINAL KEYSTONE.—A drift has been started in the prospecting shaft on the north end of the claim to cut and prospect the ledge. The foundations for the new hoisting engine and other machinery are making the best of progress, and will soon be ready for the reception of the machinery. A large force of workmen are employed on the new hoisting works building, which is being pressed forward to completion as fast as is consistent with the durability and efficiency of the works.

ALTA.—The shaft has reached the 1550 level, at which point a station has been opened and a drift started to cut the ledge. A large portion of the ore vein on the 1150, 1250, 1350 and 1450 levels will be ready for crosscutting in a very short time.

JUSTICE.—Sinking the double winze below the 1300 level is making the best of progress, the bottom still in a fine character of quartz and ore. The south crosscuts on the 1100 level, near the Silver Hill line, are showing an improvement in both the character and quantity of the ore encountered.

CROWN POINT.—The east crosscuts on the 500 level are each still advancing in favorable vein matter. The north drift on the 2300 level is being pushed steadily forward, following the west side of the ore vein. The surveys were completed and two east crosscuts started this morning on the 2300 level. These drifts will be pushed ahead with all the vigor possible, and others started as soon as the north drift on that level reaches the Kentuck line.

EUREKA DISTRICT.

CUM GRANO?—Eureka *Sentinel*, Aug. 25: The steady progress of Eureka district in the development and yield of its mining properties, is a gratifying indication of its permanence, and demonstrates that the future is full of promise. There has been so little boasting in connection with the development of its resources that it is only within the last two years that the outside world has become acquainted with its importance, and at the present time, localities which do not possess one-tenth of the merit of the base range, are given prominence in the Eastern and San Francisco journals, while this district is almost unnoticed; and this in the face of the fact that Eureka district is contributing over a million dollars per month in gold and silver to the money centers, and the aggregated yield for the past ten years is considerably more than fifty million dollars in precious metals. It is amusing to see the San Francisco papers, and particularly those devoted to the mining industry, give prominence to official letters and voluminous reports from mines located on the Comstock, in which a pound of ore has never been discovered and is never likely to be discovered, without even a notice of this district. Good mines are possibly as well off without notoriety, but the richest lodes have needed capital to develop them, and while half a dozen properties in this district are yielding largely, there are miles of virgin ground and hundreds of claims that only need the impulse of capital to take rank with the best. Ore is found all over Prospect mountain; on Adam's hill, along the great lode from Ruby hill to the Hoosac mountain at Silverado, Spring valley, Secret canyon and other contiguous places. Let one-hundredth part of as much capital as has been sunk in holes in Storey county, be expended in this district, and there is no section that would give as speedy or as handsome returns.

MOUNT ROSE DISTRICT.

QUARTZ MILL WANTED.—Winnemucca *Silver State*, Aug. 27: Ore is being sent here from various mines and stored in the freight houses, as there is no place where they can get it crushed at present this side of San Francisco. The Auburn mill at Reno is not doing custom work, as the lessees, Messrs. Jones & Kinkead, have sufficient ore of their own to run it to its full capacity until their lease expires. The White & Shiloh works at Galena are said to be shut down, and the title to the Humboldt reduction works here has not yet been decided by the Supreme Court. This unfortunate state of affairs retards the development of the Paradise mines, whose owners are principally poor men who cannot incur the expense of extracting ore to let it lay on the dumps for months. If some arrangement could be made between the persons who claim the reduction works whereby they could be run, it would greatly benefit this community, as mine owners could realize from their ores and be enabled to give employment to a great many men at fair wages.

IDAHO TERRITORY.

ALTURAS.

VARIOUS MINES.—*World*, Aug. 23: The mines on Queen's river about 10 miles from Altanta, are looking splendid, and as depth is obtained everything shows permanency. The ledges widen in depth and the ore grows richer. One gold bearing ledge and two silver ledges have been found, and several that carry both gold and silver. The machinery for the hoisting works of the Buffalo mine is on the road between Rocky Bar and Atlanta. The Buffalo mill is making a run on 500 tons of ore from the Monarch mine. The Monarch mill is also running on ore from the same mine.

BONAPARTE.—*Statesman*, Aug. 29: Prof. H M. Winn has succeeded in organizing in the East a company to mine the Bonaparte claim. The capital stock is $2,500,000, with a large paid-up working capital, a sufficient amount of which is placed in Winn's hands to start his work in good shape. As fast as needed, more money will be forthcoming.

IDAHO ITEMS.—The Potosi mine continues to yield well. The ledge at the present point of operation is two feet wide and liberally streaked with mineral, showing heavy sulphurets all through. Some of the rock shows as high as 50% mineral. There is a force of nearly 50 men at work in and around the Black Jack. The Gold Hill shaft is down 250 feet and the tunnel to tap the ledge has been started. Mr. J. F. Harvey has built an arastra on Willow creek to work rock. The mine which was discovered last spring in Deer gulch, Boise county, near the Idaho City road, is being developed as rapidly as possible.

News in Brief.

A Chinese envoy is about to be despatched to Russia.

A chamber of commerce has been established in Tokio.

SWARMS of crickets are reported in San Buena Ventura.

SAN Francisco gave about $2,000 for the yellow-fever sufferers.

ON Aug. 28th the *Great Republic* carried over the Columbia river bar the largest and most valuable cargo ever shipped from Oregon.

THE condition of the oat crop, as shown by August returns to the Agricultural Department, is represented by 100; average of July, 101.

AUGUST 31st the Anti-debris association subscribed $170,000, assessable to an extent not exceeding 3% for the purposes of the society.

BULGARIANS maltreated Jews and Turks. Russians interfered. Consequence, a fight in which Russians and Bosnians were killed. Reform!

THE Tokio *Times* has advocated a commercial alliance with the United States which shall free the trade between the two countries from tariff charges.

THE European delegates to the Monetary Congress thank the United States for bringing about a change of opinion on important monetary questions.

THE effort of a Philadelphia coal company to introduce their anthracite into the non-coal producing countries of southern Europe, promises to meet with success.

ON August 28th, a paper by Prof. Hilgard of the University of California, on the relations of science to agriculture, was read before the National Agricultural Congress.

COLONEL HOGG of Oregon, has just returned from Europe, thinks that the Indian troubles and the cry of glutted labor market, will probably ender immigration small the coming year.

THE S. F. Copper M. Co. at Spenceville, Nevada county, is now shipping 30 tons of pure copper per month, and during the coming fall will increase their shipments to 50 tons per month.

CATTLE in large numbers are dying of murrain in Tulare and Fresno counties. Large numbers are also dying in Fresno of a disease not heretofore met with in this country. The hair rises up on the back, becomes greasy in appearance, the animal ceases to eat, and dies in a few days.

The Engineer.

Railroad Surveying.

A writer in the *Manufacturer and Builder* has an appreciative word for the railroad surveyor. Perhaps no class of men are subject to greater hardships aud privations than civil engineers who have to make the first surveys for a new railroad, especially when the line runs through a mountainous and unexplored country; as is the case in that region of our continent known as the far West. Matters grow worse further north, in the British territory. In the heart of the mountains there is hardly a day without rain, except when it snows. At night the surveyors often lie down in the open air, and consider themselves very lucky when their blankets are dry. In the early morning they rise to a breakfast of pork and beans and the luxury of a cup of tea. While their relations at home are enjoying a sweet hour of sleep in a comfortable bed before rising, the engineers are off into the dark, silent wood or clambering up precipices, always wet from the mist, or on the rocky banks of a roaring river, coming back at night to camp tired out and hungry, but still satisfied when they have made progress in their interesting work. And this goes on from day to day and from week to week, working, eating, sleeping. Books are scarce, as they are too bulky to carry; newspapers are never seen, and so they hear no news, except when fragments of them, from three to six months old, reach them in the shape of wrapping-paper. The monotony of this mode of life is only from time to time broken by rheumatism, sore feet and hands, and, if the campaign is long and fresh vegetable food not to be had, scurvy makes its appearance, until at last the arrival of a pack train with fresh provisions is a happy event, long remembered.

In addition to all the discomforts referred to, there are dangers to life inseparable from such kind of work—fires in the forest, risk of starvation by the giving out of supplies and the non-arrival of pack trains, danger of drowning while crossing lakes or rivers in frail craft, falling over precipices, etc.

A Prismoidal Road in South Africa.

A system of one rail railway is already in use for military purposes in Transvaal, South Africa, apparently with success. This one rail road is thus described: The cost of construction is comparatively slight; it can be put up without loss of time in grading, and having no gauge, it can be readily adapted to the sharpest curves. The posts have a constant hight of seven feet, three of which must always be above ground. This leaves a four foot margin for such inequalities as cannot be overcome by a grade of one in ten. The stability of the structure is assured partly by sinking into the ground (440 holes in a mile) and partly by anchor footings. These holes are of varying depth, and really do duty as cuttings. The structure may be either of wood or iron; but wood is preferred for military purposes, since omissions or damages are more easily repaired.

The upper rail is formed of a stout oaken beam on edge, breaking joint on the posts. An iron deck beam may be used in lieu, but its use might delay the construction, in being bent to regular curves, which the pioneer does not effect. The lower or grip rail, which forms a continuous chain, as it were, for the grip engine to pull at, is in oak, notched to hold firmly to the posts and struts. These deep notches, occurring with regularity at every four feet, admit of ready but not too facile bending on curves, the maximum being fixed at 100 feet radius, or about two inches per bay. Saw cuts at every eight inches are for the same purpose. The breaking strength of the structure is twenty tons, its weight about eighty tons per mile complete.

The mode of erection is very simple, and is the same whether iron or wood is employed in the construction.

Sacramento Drainage Commission.—A dispatch from Dixon, Solano county, says: The Commissioners of the Sacramento drainage district, comprising W. F. Knox, R. S. Carey and M. Eghert, with their secretary, Chris. Green, made a personal inspection of the lower end of the proposed canal line. The Commissioners were accompanied by Gov. Irwin, Gen. B. F. Alexander, Col. Mendell, chief engineer of the survey; Col. J. W. Smith, assistant engineer Pierson, and W. H. Mills, of Sacramento. The party left Elmira at 10 o'clock today and drove to Denverton, where the mouth of the proposed canal is located. After an examination on the ground of the field notes, the party followed the line of the canal to a point near Maine Prairie. The entire party reached here at half-past six this evening, and will leave in carriages to-morrow morning to inspect the mouth of Putah creek; thence they will drive to Knight's landing, returning to Sacramento by boat.

A Novel Tramway.—An improved tramway invented by Mr. H. P. Hevner, is at work on the premises of Messrs. Roehling, at Trenton, N. J. It differs from other tramways in having the load moved on a suspended track which is composed of five-eighths inch diameter round steel rods, the pulling being done by a small wire rope. The power required is very small, a six horse-power engine transporting 190 tons of material per hour with ease. The arrangements for turning off at any angle, and returning, are very perfect, and are so arranged that it is almost impossible for anything to become misplaced. Several of the tramways are to be built for use on sugar plantations, also to transport nitrate from the mountains about ninety miles back from the coast of Peru.—*Coal and Trade Journal.*

Brooklyn Bridge.—It having been announced that work on portions of the bridge was suspended and hundreds of men thrown out of work, it was thought by some that the delay was to be for an indefinite time. The trouble was occasioned by influences brought to bear upon the New York Board of Apportionment to prevent Comptroller Kelly from issuing bonds to secure the money to pay that city's proportion of the cost of the bridge. This question, says the *American Manufacturer*, is now finally settled by the decided opinion of the counsel for the city, W. C. Whitney, Esq., who concludes an elaborate statement of the case as follows: "I am therefore firm of the opinion that your honorable board is without jurisdiction in the matter; that under the law of 1875 and the ordinance of May 8th, 1876, the right of the bridge trustees to receive the money called for is perfect, and that without further action it is the duty of the Comptroller to issue the bonds and pay the money to the amount of the requisition of the trustees to the extent of $2,666,666.66, under the act of 1875." This question being settled, the work must go on.

A Minnesota Narrow Gauge.—The *Railway Age* says: That narrow gauge roads may prove desirable and profitable feeders to the existing main lines is indicated by the action of the Chicago, Milwaukee and St. Paul company in leasing the Minnesota Midland, a road of three feet gauge just completed from Wahasha, Minn., on the former line, northwesterly through a fine agricultural region to Zumbrota, some forty miles. This road, which was built, we believe, at a cost of less than $7,000 per mile, is undoubtedly equal to all the traffic that it will ever have, while in building it on the narrow gauge its projectors avoided the mistake that has beset so many minor western roads of building on a much larger and more expensive scale than was required, inspired by visions of trunk lines and enormous through business which were never realized. Under the powerful protection of the leasing company the Minnesota Midland, whose existence thus far has been a series of doubtful struggles, is certain to do a valuable and successful work in developing the region which has heretofore been destitute of rail facilities.

The Study of Light.—In closing an elementary treatise on light, the author, Prof. Mayer, writes thus beautifully of his theme: "We have seen how light moves through air, water and other transparent substances; we have learned something of the manner in which it may be reflected and refracted; and we have examined a few of the more simple facts about colors. Yet we have not by any means learned all that is known about light, nor have we exhausted half the capabilities of our apparatus. We have studied reflection from plane surfaces; all the wonderful effects produced by reflection from curved mirrors remain for further study. We have examined only one or two of the different kinds of lenses; and in the beautiful science of colors we have, as it were, only opened the gate into a strange and marvelous country. You may go on for a year and make experiments every day, and even then not reach the end. You have seen that it is not difficult to make experiments; and, should you take up other books on light and make new experiments, you would find much that would be of the greatest value and interest. Should you learn nothing else, you will see for yourself with what skill, wisdom and goodness, all those beneficent laws have been arranged. These things came not by chance, or of themselves. They all point to a great and wise Creator, who has given the light a pathway, and filled it with bewildering and perpetual beauty. It is the light that paints the flowers, tints the clouds and decks the sky in blue. Everything selects its own particular color out of the solar spectrum, and shines with all the beauty and glory of the light. No man hath counted all the glories of light, nor hath any man yet traced all its paths. It brings us strange messages from distant suns; it makes all nature beautiful."

Our Paris Mineral Exhibit.—The cases at the exposition exhibit a great variety of useful ores and minerals, such as copper, antimony, lead, manganese, iron, borax and borax minerals, asphaltum, coal oils, salt, gypsum, coal, natrium, platinum, marbles, building stones, etc. All these varieties are represented by beautiful, large specimens, carefully classed and ticketed. A regular pilgrimage of men of science takes place daily, for the purpose of inspecting the cases containing these gems. Next to the more rare samples of native gold may be seen numerous specimens of silver ore, and they again are followed by elegant and rare minerals, including a case with silicified wood in many beautiful varieties. Next to these cases is found a pyramid of the richest ores, from what is known far and wide as the Bonanza mines. Also, silver of considerable magnitude from the mines on the Comstock ledge. In another series of cases may be seen a mixed collection of very rich ores from Arizona, Oregon and Washington Territory.—*Anglo American Times.*

The Atlantic and Pacific Forests.—No. 2.

[By Prof. Asa Gray.]

From the Gulf of Mexico to the Gulf of St. Lawrence the amount of rain decreases moderately and rather regularly from south to north; but, as less is needed in cold climate, there is enough to nourish forest throughout. On the Pacific coast, from the Gulf of California to Puget sound, the southerly third has almost no rain at all; the middle portion less than our Atlantic least; the northern third has about our Atlantic average.

Then, New England has about the same amount of rainfall in winter and in summer; Florida and Alabama about one-half more in the three summer than in the three winter months, a fairly equable distribution. But on the Pacific coast there is no summer rain at all, except in the northern portion, and there little. And the winter rain, of 44 inches on the northern border, diminishes to less than one-half before reaching the Bay of San Francisco; dwindles to 12, 10 and eight inches on the southern coast, and to four inches before we reach the United States boundary below San Diego.

Taking the whole year together and confining ourselves to the Coast, the average rainfall for the year, from Puget sound to the border of California, is from 80 inches at the north to 70 at the south, *i. e.*, 70 on the northern edge of California; thence it diminishes rapidly to 36, 20 (about San Francisco), 12, and at San Diego to eight inches.

The two rainiest regions of the United States are the Pacific coast north of latitude 45, and the northeastern coast and borders of the Gulf of Mexico. But when one is rainy the other is comparatively rainless. For while this Pacific rainy region has only from 12 to two inches of its rain in the summer months, Florida, out of its 40 to 60, has 20 to 26 in summer, and only six to 10 of it in the winter months.

Again, the diminution of rainfall as we proceed inland from the Atlantic and Gulf shores, is gradual. The expanse that is or was forest-clad is very broad, and we wonder only that it did not extend farther west than it does.

On the other side of the continent, at the north, the district so favored with winter rain is but a narrow strip, between the ocean and the Cascade mountains. East of the latter the amount abruptly declines; for the year, from 80 inches to 16; for the winter months from 44 and 40 to eight and four inches; for the summer months, from 12 and four to two and one.

So we can understand why the Cascade mountains abruptly separate dense and tall forest on the west from treelessness on the east. We may conjecture also why this North Pacific forest is so magnificent in its development.

Equally, in the rapid decrease of rainfall southward, in its corresponding restriction to one season, in the continuation of the Cascade mountains as the Sierra Nevada, cutting off access of rain to the interior, in the unbroken stretch of coast ranges near the sea, and the consequent small and precarious rainfall in the great interior valley of California, we see reasons why the California forest is mainly attenuated southward into two lines, into two files of a narrow but lordly procession, advancing southward along the coast ranges, and along the western flank of the Sierra Nevada, leaving the long valley between comparatively bare of trees.

By the limited and precarious rainfall of California, we may account for the limitations of its forest. But how shall we account for the fact that this district of comparatively little rain produces the largest trees in the world? Not only produces, alone of all the world, those two peculiar big trees which excite our special wonder—their extraordinary growth might be some idiosyncrasy of a race—but also produces pines and fir tree, whose brethren we know, and whose capabilities we can estimate, upon a scale only less gigantic. Evidently there is something here wonderfully favorable to the development of trees, especially of coniferous trees; and it is not easy to determine what it can be.

Nor, indeed, does the rainfall of the coast of Oregon, great as it is, fully account for the extraordinary development of its forest, for the rain is nearly all the winter, very little in the summer. Yet here is more timber to the acre than in any other part of North America, or perhaps in any other part of the world. The trees are never so enormous in girth as some of the Californian, but are of equal hight, at least on the average, 300 feet being common, and they stand almost within arms' length of each other.

The explanation of all this may mainly be found in the great climatic differences between the Pacific and the Atlantic sides of the continent, and the explanation of these differences is found in the difference in the winds and the great ocean currents.

The winds are from the ocean to the land all the year round, from northwesterly in summer, southwesterly in winter. And the great Pacific Gulf stream sweeps toward and along the coast, instead of bearing away from it, as on our Atlantic side.

The winters are mild and short, and are to a great extent a season of growth, instead of suspension of growth as with us. So there is a far longer season available to tree vegetation than with us, during all of which trees may either grow or accumulate the materials for growth. On our side of the continent and in this latitude, trees see the whole autumn in getting ready for a six-months' winter, which is completely lost time.

Finally, as concerns the west coast, the lack of summer rain is made up by the moisture-laden ocean winds, which regularly every summer afternoon wrap the coast ranges of mountains, which these forests affect, with mist and fog. The redwood, one of the two California big trees—the handsomest and far the most abundant and useful—is restricted to these coast ranges, bathed with soft showers fresh from the ocean all winter, and with fogs and moist ocean air all summer. It is nowhere found beyond the reach of these fogs. South of Monterey, where this summer condensation lessens, and winter rains become precarious, the redwoods disappear and the general forest becomes restricted to favorable stations on mountain sides and summits. . . . . The whole coast is bordered by a line of mountains, which condense the moisture of the sea breezes upon their cool slopes and summits. These winds, continuing eastward, descend dry into the valleys, and warming as they descend, take up moisture instead of dropping any. These valleys, when broad, are sparsely wooded or woodless, except at the north, where summer rain is not very rare.

Beyond stretches the Sierra Nevada, all rainless in summer, except local hailstorms and snow-falls on its higher crests and peaks. Yet its flanks are forest-clad; and, between the levels of 3,000 and 9,000 feet, they bear an ample growth of the largest coniferous trees known. In favored spots of this forest—and only there—are found those groves of the giant *Sequoia*, near kin of the redwood of the coast ranges, whose trunks are from 50 to 90 feet in circumference, and hight from 200 to 325 feet. And in reaching these wondrous trees you ride through miles of sugar pines, yellow pines, spruces and firs, of such magnificence in girt and hight, that the big trees, when reached—astonishing as they are—seem not out of keeping with their surroundings.

[To be Continued.]

The Wastes of Parasites.

In his lecture on the "Wastes and Burdens of Society," recently delivered in this city by Rev. Henry Ward Beecher, the following paragraph occurred. The next waste that I shall mention is the waste which comes from parasites. I understand the parasite to be an animal which was organized to get its living without working for it. There is a great abundance of them throughout nature. Men have their parasites, and communities have whole hordes of them, for I hold that, setting aside those who are reduced by misfortune, all the men in a community that live without returning an equivalent to society for their livelihood are parasites—every man that lives on other people's industry, on other people's economy, on other people's productiveness, is a parasite. He sucks for a living; he don't work for it. The whole criminal classes are simply parasites; they produce nothing and consume a great deal. The whole class of vicious men, as they are scattered broadcast over the whole community, are parasites. They do not add to the public wealth; they draw it out, and live without gaining a living. The whole multitudinous mass of lazy men are parasites. They earn nothing, produce nothing, use up a good deal, and they are, from top to bottom of society, all criminals, and all vicious men, and all lazy men—parasites on society. It ought to make society ashamed to see what vast hordes there are permitted to nibble, and suck, and consume, but do nothing for a living. I hold it to be a duty to comb out the parasites, and to free the community from the waste and destruction which they make without any restoration or equivalent return. Among the parasites enumerated by Mr. Beecher were the gambling-house keeper, the keeper of lust houses and the saloon keeper, and as a preacher of the gospel—his business, as people will say to him—he held it to be his duty, in addition to his duty as a citizen, to protest against the abuses thus fastened upon society.

Texas and Pacific.—The annual meeting of the stock-holders of this railway company was held at the office of the company in Philadelphia on the 13th inst. Following is a synopsis of the operations of the company for the year ending May 31st, 1878, as shown by the report of the directors to the stock-holders. The number of miles of road operated was 444, as follows: From Shreveport, La., to Fort Worth, Tex., 219; from Marshall, via Texarkana, to Sherman, 225 total length of main track and sidings, 483 miles. The receipts for the year ending May 31st, 1878, were as follows: Gross earnings, $3,331,310.35; working expenses, $1,448,439.92; net earnings, $882,870.97. Out of this has been paid the interest on the first and consolidated mortgage bonds, taxes, insurance, and betterment expenditures. Resolutions were adopted expressing a high degree of satisfaction with the report, congratulating the stockholders upon past results and the prospects for the future, and thanking the president and vice-presidents of the company for their earnest efforts during the past year, to call public attention to the great advantages which can be secured to the government and the country by the final completion of the Texas and Pacific railway to the Pacific ocean, thus furnishing one of the grandest avenues for the developments of southern and southwestern trade, and so adding largely to the business interests of the entire country.

Utilization of Blast-Furnace Slag.

Although the propositions to utilize blast-furnace slag have been very numerous, comparatively little has been done to introduce it, owing, no doubt, to the circumstance of a different method of handling being necessary, as compared with the materials for which it has been proposed as a substitute. This objection will be to a great extent removed by the invention of Mr. J. S. Wethered, of New York, who proposes to use it as a road-making material, but after it has been compressed into suitable blocks with other ingredients to form a hard concrete. He claims that the improved concrete may comprise any preferred ingredients in any proportions, so long as furnace slag, limestone or other calcareous substance and asphalte are employed. An excellent concrete, for example, may be made of 80 parts of furnace slag or limestone suitably crushed or granulated, and 20 parts of asphalte tempered with mineral oil. The proportion of the oil to the asphalte will depend upon the richness of the latter, but in general it should be from 8 to 10%. In order that the furnace slag, limestone or other calcareous matter and asphalte may combine completely, and the latter be absorbed by the former to the fullest extent practicable, it is necessary to heat the calcareous matter to a high degree after it has been suitably crushed or granulated, and before it is mixed with the heated asphalte; and the said invention partly consists in so heating the calcareous matter. The degree of heat should be more than enough to merely effect the drying of the material. It should be sufficient not only to drive off the moisture and carbonic acid which the material contains, but to open the pores and so expand the material as to enable the heated asphalte to readily permeate the substance, and become thoroughly incorporated with it. For heating the calcareous matter an oven of common construction, or an ore roasting furnace, may be employed.

After the crushed furnace slag, limestone, or other calcareous material has been heated, as described, it is, while in its highly heated state, to be mixed with the heated asphalte, and with the other ingredients which are to compose the concrete in any suitable apparatus used for mixing concretes. A horizontal cylinder of iron mounted in bearings, and made to revolve around a shaft furnished with radially projecting arms for mixing the mass, will furnish a simple and effective apparatus for the purpose, and it will be found advantageous to apply heat to said revolving cylinder while the process of tumbling and mixing the material is going on. The concrete having been so prepared is now in proper condition to be spread as a side walk pavement and rolled smooth.

For paving road beds it is necessary that the concrete material prepared in the same way should be condensed under heavy pressure, while in a mold, into the form of blocks. This operation should be preformed while the concrete is still hot, as thereby the block is rendered more homogeneous, and the particles composing it more thoroughly compact. When, however, the block in a highly heated condition is expelled from the mold by the discharging plunger of the compressing machine, it often happens that it will crumble, and to avoid this injury time must be allowed for the mass to become set before it is removed. The delay interferes with the economy of the manufacture, and, therefore, this part of the said improved process consists in subjecting the heated block, after it has been molded and compressed, to the chilling effect of cold water applied to its surface. This treatment is best performed at the instant that the block is raised out of the mold, or as soon as possible after it has been deposited upon the endless apron or conveyer for removing it from the machine. The water may, however, be applied to the block while it still remains in the mold, or the mold itself may be chilled by means of a circulating stream of cold water. The effect of this chilling process is to harden the exterior surface of the molded block.

Compressed blocks, the material of which has been prepared, and which blocks have been molded as above described, are not only valuable for paving road beds, but possess great utility as an artificial material for the construction of submarine or exposed sea walls, or for other building purposes. Experiments, too, have shown that compressed bricks of this character can be used for the walls of fortifications with great advantage in comparison with natural stone. They are enabled from their great density to sustain without any greater injury than indentation to a limited extent the impact of heavy projectiles, while their peculiar toughness and slight elasticity prevent injury from splintering or fracturing.—*Mining Journal.*

Pennsylvania Railroads.—The annual report of the secretary of internal affairs of Pennsylvania contains the following information in regard to the railroads of that State for the year 1877: The comparative statements of 161 railroads show that only $257,577,357 capital stock was paid in 1877, against $486,419,097 in 1876, and their funded and floating debts were reduced from $448,324,000 to $301,805,083. Thirty-two declared no dividends, while there were only sixteen which failed to do so in 1876. The number of passengers carried was 19,878,311, against 51,829,822 for the previous year. Their tonnage fell off from 79,382,012 to 46,582,083 tons, while their expenses were reduced from $75,723,845 to $33,953,155, and their receipts from $125,739,841 to $42,078,109.

Useful Information.

Photographing at Night.

Many attempts have been made to produce photographs by artificial light. Practically these efforts were successful; but, artistically considered, the resulting pictures were very unsatisfactory, and could even be called decidedly bad, by reason of the defective illumination, which caused only white and black to appear and a total absence of middle tints, which are the charm and essential virtue of every good picture. They were scarcely as good as the very first attempts to make photographs of the human face by Prof. John W. Draper, of New York, in 1839, and looked as if the sitter had been placed in direct sunlight. As portraits they were so objectionable that nobody liked or wanted them. The *Manufacturer and Builder* says that Mr. Henry Van der Weyde, now residing in London, England, corrected this by inventing a method to so manage the electric or other lights used as to equal the day effects and produce an artistic picture, a problem the solution of which does not fall in the direct line of pursuit of the ordinary photographer, but exactly in the line of pursuit of the portrait painter, in which art Mr. Van der Weyde has earned a great reputation. The pictures thus taken by diffusing the light on the half shaded parts, so as to bring out the semitones, are fully equal and generally even surpass those produced on the brightest days in London. The artificial light is easier to manage than the sunlight, being always under control, if the photographer only knows how to apply it. It is not surprising then that this process has become quite popular in London, especially among those who attend operas, theaters, balls, concerts or dinner parties, when, in going or coming, people are dressed in their best and can more conveniently sit for their pictures than during the bright hours of the day, which are rarely convenient for persons who have to attend to business, and even for people of leisure who indulge in late hours and late risings.

Hight of Colorado Peaks

In a recent volume of the geological and geographical surveys prepared for the government by Lieutenant Wheeler's expedition, the following are given as the points in Colorado exceeding 13,000 feet in hight: Altar Peak, 13,254; Antoro Peak, 13,497; Argentine Pass, 13,286; Canby Peak, 13,356; Del Norte Peak, 13,084; Dunn's Peak, 13,502; Engineer Peak, 13,076; Evans Mountain, 14,321; Glacier Peak, 14,243; Gray's Peak (north) 14,380; (south) 14,411; Half-Moon Creek Peak (south of) 13,552; Handie's Peak, 14,149; Divide between Henson and Cebolla Creeks, 13,003; Hunchback Peak (Oso) 13,755; Hunt's Peak, 14,055; Mount Harvard, 14,152; Hurricane Peak, 13,565; La Plata Peak, 13, 316; Mount Lincoln, 14,375; Macomb's Peak, 13,154; McClellan's Peak, 13,842; Mears Peak, 13,008; Meigs Peak, 13,393; Mesquite Pass, 13,308; Pass Peak, 13,092; Red Cloud Peak, 14,093; Red Mountain, 13,333; Rosalie Peak, 14,236; Simpson's, 14,056; Spanish Peak (west) 13,718; Stewart's Peak, 14,032; Trinchera Peak, 13,681; Uncompahgre Peak, 14,408; Yellow Peak, 13,618. Long's Peak, Pike's Peak, Mount Yale, and some others of the highest summits in Colorado, are omitted. Mount Whitney, or Fisherman's Peak, in the California Sierra, is set down as 14,448 feet high—the most elevated point named in the table.

Labor Statistics.—The facts which have been compiled by the Massachusetts Bureau of Statistics to show the condition of labor in that State, furnish, says the N. Y. *Tribune*, a good answer to its demagogues, domestic and imported. The Bureau found 21,000 laborers out of employment on the 1st of June, of whom nearly two-thirds were unskilled laborers. This number, it is believed, would have been greatly reduced if the enumeration had been made at a busier manufacturing season, though there is compensation in the fact that it was made when many persons had temporary employment on farms. Admitting this figure to be larger than it is well to have it, the report still declares that there have been fewer demands for charitable relief, throughout the State, as shown by indisputable evidence, than for several years back; and the general testimony of officials is that many of those who are without work would not take it if they could get it. Taking this result as a basis, the whole number of persons out of employment in the United States is estimated at 570,000, or less than 6% of the aggregate of persons occupied in what are called productive industries. This is a formidable showing, and yet it is scarcely one-sixth the size of the figure that the tramp statesmen have been imposing upon their audiences.

Incense.—Druggists are sometimes called upon to compound incense for church use. The London *Chemist and Druggist* gives the following recipe obtained from a Catholic convent. Benzoin and storax, of each 4 ounces; laudanum and myrrh, of each six ounces; cascarilla, 3 ounces; oil of cinnamon, 8 minims; oil of lavender and bergamot, of each 20 minims; oil of cloves, 10 minims. Mix and pass through a coarse sieve. Another recipe is: Olibanum, 7 parts; benzoin, 2 parts; cascarilla, 1 part.

American Paper Stock in Paris.—American paper makers, says the *Call*, have been in remarkably good luck at the Paris Exposition. The grand prize, a gold medal, was borne off by a Massachusetts firm, for his ledger paper. Four other gold medals were taken by as many different paper manufacturers. Four silver medals were awarded to other firms. Nine bronze medals were given, and nine certificates of merit awarded. The different articles for which these prizes were bestowed, comprised ledger paper, fine writing paper, fine card paper, leather board paper, leathered paper, visiting cards, bond paper, press boards, blotting paper, paste board, envelopes, carpet lining paper, printing paper, papeteries, safety paper for checks, rope paper, paper bags, letter slips, boxes, thin tissue paper, binders' board, blotting and bank note paper. The compliment of these awards is all the more valuable from the fact that one of the jurymen was the leading paper manufacturer of France. The correspondent who communicates the news here recited, writes as follows, "In consequence of this exhibit and of the persistent efforts making by the manufacturers and their agents abroad, the export of American paper continues to grow monthly. It has risen from $491,000 in 1871, and $856,000 in 1876–77, to over $1,000,000 in 1877–78. The fall of gold within the last two years would probably have cut off this promising export in its early youth, it is stated, had it not been for a corresponding reduction in the cost of paper, brought about by American science and enterprise. The use of wood pulp in this country, as an ingredient in paper, has assumed such proportions, that it has caused a fall in the price of rags, and this enables American paper to hold its own abroad, assisted as the fall of price is by the constant exhibition of samples in the leading markets, and agitation by the agents.

Good Health.

The Lessons of the Yellow Fever Scourge.

The terrible spread of the yellow fever scourge through our Southern cities, says the Utica *Herald*, is undoubtedly due in every instance to the neglect of the most ordinary sanitary precautions. The Southern cities are far behind those of the North in drainage. The condition of New Orleans and Memphis, when the yellow fever broke out in their streets, is said to have been filthy almost beyond belief. In the decimated town of Grenada, a correspondent writes that shortly before the outbreak of the epidemic, the main sewer leading through the town to the river caved in, and in order to repair the damage the sewer was uncovered for a long distance. It was found to be filled with the carcasses of dead animals, and the hot sun pouring upon them, the air was soon filled with stench and contagion. The penalty of that criminal carelessness is a terrible one. That the disease can originate from decomposition is not, we believe, clearly established; but there is no doubt that the common effect of the gases arising from the refuse left by imperfect drains is to so debilitate the human system as to create a predisposition to receive contagion, or to succumb to minor diseases which are not contagious. It is this predisposition which makes epidemics, and defies human skill.

There is no good reason to expect that the Southern scourge will spread to Northern cities. It will in fact stop, wherever it reaches a locality in which proper care has kept the population free from this predisposition; a debilitating climate also has its effect, and in both respects, the North is better off than the South. But it does not follow, on these accounts, that we can safely neglect the precautions which have been neglected with such fatal consequences in the Southern cities. Now is a good time to discover, both as to municipal and private drainage, whether it is in all respects what it should be. Private drains are especially liable, from long use, to become defective, and property owners are almost universally careless about constant inspection. A danger lurks here which is not confined to cities and villages, but extends to the farms. The pure and healthy air of the county is often poisoned by stagnant and neglected drains under the very nostrils of the thoughtless household. It is often years before the development of fatal disease; but it is sure to come in time. The same causes which are dealing out death in Grenada have brought the grim shadow into many a Northern household; and very often the dead have been buried and the source of the disease left unsuspected and untouched.

Feeding Infants.—The subject of the feeding of infants was discussed at the annual meeting of the State Medical Society of New Jersey, and the *Medical Record* sums up the results as follows: "The mother's milk is generally conceded to be the best for the infant. But, even when this is abundant, it may be disadvantageous for the individual living on it, and a substitute be necessary. Country practitioners recommend cow's milk as the best substitute, while many in cities and towns speak highly of condensed milk. Of the preparations so various and so highly commended by those who put them on the market, the Imperial Granum seems to hold the first place in the estimation of medical observers. All agree in condemning the use of nursing tubes as unclean, even with the best of care."

Ventilating Sewers.

The Board of Health of San Francisco have begun again to bore holes in the covers of sewer openings. While we do not profess to know all there is involved in the practice, we may cite the testimony against the practice of ventilating sewers. Mr. Henry E. Knapp, a civil engineer of New York City, read a paper recently before the polytechnic branch of the American Institute, in which he attacked the theory of ventilating sewers and drains. He said that the conclusion seemed almost unanimous among engineers that the poisonous and mephitic vapors should be allowed to escape into the atmosphere so that the sewers should be purified, thus to contaminate the atmosphere and transpose the pure air into the sewers where it is not needed, and from the sewers bring the poisonous gases where they will act detrimentally to animal life. The prevaleuce of this theory, which Mr. Knapp declared to be an egregious error, he attributed to the writings of Robert Rawlingson, K. C. B., a personal friend of the Prince of Wales, who, after the illness of the latter by typhoid fever, devoted much attention to the subject, and spread his views by means of the press.

The first objection Mr. Knapp urged against the theory was that the liberated gases are heavier than atmospheric air, and if liberated from the sewers would hug the surface of the earth, so that invigorating air could not be had inside the city. It would be as sensible to ventilate graves. The sewers, like corpses, ought to be buried, mainly because the earth is the best absorbent of the products of the decay of animal and vegetable substances.

The proper way to deal with sewers, he conteuded, was to give them plenty of water, which carries the matter contained in them to the sea, impedes decomposition as long as the solid matter is sufficiently immersed, and is a powerful absorbent of sewer gases, especially the ammoniacal, which it takes up to the extent of about one-third its weight, or some four hundred times its own bulk. If this be done, and proper traps are constructed, no evil results will follow.

A Cottage Water Filter.—Those who cannot afford to buy a filter may easily make one. Stuff a piece of sponge in the hole of a flower pot, place above this a layer of pebbles, then a layer of coarse sand, and above this a layer of pounded charcoal three or four inches in depth. Another layer of pebbles should be placed above the charcoal to prevent it from being stirred up when the water is poured in. The contents of the flower pot should be occasionally renewed. But by a small addition to this a cottage filter may be made which, for practical use, is quite equal to the most expensive filter of corresponding size. It consists of two flower pots, one above the other, the lower one fitted with a sponge and filtering layers above described, and the upper one with a sponge only. The upper pot should be the largest, and if the lower one is strong the upper one may stand on it, or a piece of wood with a hole to receive the upper pot may rest on the brim of the lower one. The two pots thus arranged are placed on a three-legged stool with a hole in it, through which the projecting part of the lower sponge passes, and the water drops into a jug placed below. The upper pot serves as a reservoir, and sponge stops the coarser impurities, and thus the filtering layers of the lower one may be used for two or three years without being renewed, if the upper sponge be occasionally cleaned. Care must be taken to wedge in the upper sponge tightly enough to prevent the water passing through the upper pot more rapidly than it can filter through the lower one. —*Leisure Hour.*

Errors in Diet.—*Science for All* says there is no doubt that a goodly proportion of the "thousand ills that flesh is heir to" might successfully be guarded against by a wider dispersion amongst us of physiological knowledge and a more general acquaintance with the chemistry of the human body so far as it relates to the appropriation and assimilation of food. How is it that the average duration of life is little more than half the orthodox three score years and ten? Look around, and mark the general neglect of sanitary laws, and the answer is plain. Impure air, intemperance and dissipation produce a long catalogue of disorders; but errors in diet are as effectual in shortening life as any of these causes, and are, perhaps, of more common occurrence. Intemperance and dissipation are not gentlemanly vices, but errors in diet are highly respectable, and sanctioned by the usages of the most fashionable society. Rich soups, highly-seasoned dishes and hot condiments are swallowed in defiance of the simplest dietetic laws, while the poor stomach, constructed for simple fare in moderate quantities, is distended with a huge conglomerate of fish, fowl, flesh and pastry, which the gastric juice cannot permeate, and the digestion of which can only be effected by a disastrous expenditure of vital force. In youth and early manhood the elasticity of our constitution is such that a considerable amount of abuse can be borne without much apparent injury or loss of tone; but sooner or later there will come a revolution; the ill-used organs will rebel, and terrible will be the revenge they will take for the long-continued slavery and hardship to which they have been subjected.

SAN FRANCISCO:
Saturday Morning, Sept. 7, 1878.

TABLE OF CONTENTS.

EDITORIALS.—Willard's Desulphurizing Furnace; Kelly's Transom Adjuster and Lock; The Mines and the Courts, 145. The Week; Why Is It? 152. The Globe Gaslight Company of California; The Improved Revolving Lawn Sprinkler; A New Elevator Hoist; A Simple Appliance of an Old Principle, 153. Patents and Inventions, 157.

ILLUSTRATIONS.—Willard's Desulphurizing Furnace, 145. Globe Gas Company's Carbureter; Globe Gas Street Lamp; The "Perfection" Lawn Sprinkler, 153.

CORRESPONDENCE.—Truckee and Vicinity; The Coal-Gas Works of the Napa State Insane Asylum, 146.

MECHANICAL PROGRESS.—Construction of Manholes in Steam Boilers; Testing the Strength of Cement; Keeping on the Scale; A Steel Propeller; A Novel System of Brick Burning; New Process of Shipbuilding; American Success at Paris; A New Oil Well Device; American Locks Abroad; Hydraulic Railway in Paris, 147.

SCIENTIFIC PROGRESS.—Prof. Haeckel on the Echinodermata; Dangers that Beset Submarine Cables; Depths of Lakes; How Grapes Ripen; A Double Expedition to the North Pole; Artificial Production of Crystals of Silica; Mosandrum; Hydrogen; Natural Science in Education; A Recovered Fungus, 147.

WHAT AND HOW?—Miners' Inch; Ione Clay, 152.

MINING SUMMARY from the various counties in California, Nevada and Idaho, 148-9.

MINING STOCK MARKET—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 156.

NEWS IN BRIEF on page 149 and other pages.

THE ENGINEER.—Railroad Surveying; A Prismoidal Road in South Africa; Sacramento Drainage Commission; A Novel Tramway; Brooklyn Bridge; A Minnesota Narrow Gauge, 150

USEFUL INFORMATION.—Photographing at Night; Hight of Colorado Peaks; Labor Statistics; Incense; American Paper Stock in Paris, 151.

GOOD HEALTH.—The Lessons of the Yellow Fever Scourge; Feeding Infants; Ventilating Sewers; A Cottage Water Filter; Errors in Diet, 151.

MISCELLANEOUS.—Metallurgy of Silver; The Earth's Strata; Uniting the Hudson and East Rivers, 146. The Study of Light; Our Paris Mineral Exhibit; The Atlantic and Pacific Forests.—No. 2; The Wastes of Parasites; Texas and Pacific, 150. Utilization of Blast-Furnace Slag; Pennsylvania Railroads, 151. Anti-Debris Association, 152.

NEW ADVERTISEMENTS.

Brown, Sec'y, S. F.; Keystone Quartz Mining Co., Louis Vesaria, Sec'y, S. F.; Delinquent Notice—Mariposa Land and Mining Co. of California, Leander Leavitt, Sec'y, S. F.; fron Pipe, Barker & Snow, S. F.

The Week.

Reports from mining districts are, as a whole, very cheerful. The Sutro Tunnel has already made itself felt on the Comstock, not only in the capacity in which it is benefiting the Julia, hut also in its power to revive old abandoned mines. We have in view at present the Senator mine. A few months ago this mine was sold for debt. The purchasers have formed a company, and will prospect the mine through the great tunnel.

But it is not necessary to go so far as the Comstock to find enterprising activity in mining circles. Nor when we pass the Comstock and go further eastward, do we leave all the wide-awake mines hehind. All through Nevada, Idaho, Montsna, Utah, Colorado and Arizona, determined prospectors seem to increase in numher, and, which is hetter, in their track are following a little less reluctantly, we think, thsn they did a short time ago, the all-powerful capitalists.

On this side the Sierras, Mono county is not the only mining district, though it occupies so large a position of our attention. Nevada county has nothing hut hopeful news from old mines and from lately opened claims. In Shasta county the prospects of the copper mines are looking up. French capitalists, whether residents of France or not, is not stated, contemplate the erection of a smelting works in some favorable part of the copper region. The Mono excitement will redound to the advantage of Fresno county. The Quartz Mountain Gold mining company, lately incorporated, will work in the latter county.

Why is It?

"Considering the vast extent of mountain ranges extending for many miles northeast and southwest from Austin, why is it that there is so little prospecting done? Yes, why? In hoth directions, in times past, good prospects were found, and yet the vast extent of country mentioned has remained dormant, left vacant seemingly for future generations. Men now and then with a little money on hand get out of work, and in place of turning their time to profitahle account to themselves, hy looking over the mountains for a mine of their own, will hang around towns and waste their savings for that which hrings no return, hopelessly so, waiting for "something to turn up." A prospecting tour in looking for mining property costs hut little, if any more than to remain idle in town. If miners when out of employment would adopt this proposition more frequently, they would he the gainers and the country at large greatly benefited hy the development of more mining property. Who knows hut there may he another Califoruia and Consolidated Virginia honanza within 10 miles of Austin, awaiting an owner? If so, it is certain to remain in its native formation unless unearthed by human skill and device. There is doubtless many times more gold and silver in the Toiyahe range of mountains than would pay off the national deht, and yet men are frequently heard growling about the dull times, when the very ssme men could enrich themselves hy suddenly waking up and pushing their muscle and exercising their judgment."

We clip the above from the Austin, Nevada, *Reveille*, and think it worthy of republication. If all the newspapers of the Pacific coast would only consent to drop politics for a while, cease to rehash the details of all the disgusting and horrihle occurrences they can scrape together, relieve the puhlic from a wearisome and unending parade of stale clippings, and, instead, spend their time in studying the real needs of their districts, they might contribute some little to the material and moral advancement of their country. As it is, some of them hear the weary appearance of worn out pauders, and it is refreshing to hear a voice like the ahove exhortiug, though faintly, to wisdom.

Too many men are allowing their "muscle" aud "judgment" alike to grow rusty, and are dependent for a living upon the exercise of the faculties of others. Idleuess is hy no means confined to impecunious individuals. Men with capital look ahout the country seeking an investment. With the help of friends they decide that "*the* occupation of the Pacific coast is mining." Straightway they put their capital into some old and renowucd mining stock, resting satisfied that their duty as citizens has been done. They feel that they are advancing the interests of their country. Some of this capital goes immediately into the pockets of the stock hrokers. The remsinder is employed by men scsrcely known hy the owner, in further "developing" that old and respectahle mine. Meanwhile the capitalist does little else than watch with feverish excitement the rise and fall in the stock market. If he is a youug man the chances are that he will fall into had habits. Yet all the time he feels that he himself through his capital is helping to develop the resources of the land.

Suppose we take a parallel: A certain Frenchman has saved up a little money. He inqnires of his frieuds how he shall iuvest it. His friends tell him that the industry *par excellence* of his district is wine producing. Of that busiuess he knows nothing. He cannot run even a small vineyard. So he settles down resolved to drink per diem as many glasses of wine as his system can stand. "Thus," he says, "I will stimulate the business of the retail dealers, and through them encourage the culture of the vine."

A stimulated productiou is hy no means a sign of prosperity. We thought the stimulated manufactures after our war were an indication of prosperity. The Germans had the same idea after they had marched to Paris, eight years ago. How great our mistake, how hollow that prosperity, hoth we and Germany are heginning now to realize. A country is more prosperous the greater the numher of men that are finding individual and direct employment. The more independent that employment the hetter, even though it he less promising.

Why, then, will young men consent to "hang around towns and waste their savings for that which hrings no return." Wake up a little energy? Do your own prospecting; handle your own pick aud spade; conduct your own mine. Try to farm even if you can only raise enough potatoes to harter a little for your own more varied liviug. One thiug is sure, so long as you waste your time, you cannot earn one honest penny. And so long as you hsve not an honest penny, it will he an injury to the community if you succeed in hegging a single penny's worth of credit. On the other hand, a penny's worth of peuny, will surely hring a penny's worth of credit. And there are scores of men who have so much capital that they cannot possihly employ it all themselves, who, so soon as you estahlish a reliahle credit, will he willing to lend you unlimited amounts with which to carry on your enterprise.

THE Reed quicksilver mine, Yolo county, has closed. Seventy or eighty men are thrown ont of employment.

Anti-Debris Association.

A correspondent of the *Record Union* at Yuba City writes as follows: An invitation having previonsly heen given to the citizens of Yuha and Sutter counties, a large and enthusiastic meetiug was held at the Court-house in Yuha City at 1 o'clock P. M., Saturday, August 24th. The purpose of the meeting was to consider the hest means to be adopted wherehy the impending destruction of the agricultural interests hy hydraulic mining may he averted, and to better unite all onr farmers in one common cause in their demsnds for protection.

The meeting was called to order by J. H. Keyes. George Oleyer was elected chairman and B. F. Watson, secretary. The Chair stated the objects of the meeting to he as already set forth, and urged determined and united action hy all the agriculturists, in order to get an early and final decision hy our Courts of last resort, settling forever the rights of the miners, whether they can use the rivers and farms as dumps for their debris.

Mr. Keyes addressed the meeting, setting forth in forcihle language the great need of a more thorough organization of the farmers of the whole Sacramento valley, and at Sacramento, Marysville, and other cities and towns that are threatened with destruction. He submitted a plan for organization, which was well received.

Hon. C. P. Berry then took the floor, and addressed the meeting at considerahle length on the same subject, showing the great uecessity of a closer union of the great agricultural and commercial interests of this State; that without this union we would surely all he covered hy this lava of mud and sand. The speaker showed how thoroughly the hydraulic miners were united, that their organization extended the entire length of the State, that when one mine or company is attacked in the Courts the expense of litigation is horne by all of them in proportion to their value. That the capital arrayed against us is immense, reaching into the millions. And to successfully combat this great comhination, it is absolutely necessary to unite aud organize the agriculturists, to the end that this question or conflict may he determined on its merits.

S. R. Chandler, Jonas Marcuse, J. D. Wilber, Dr. Durst of Wheatland, S. D. Wood and J. M. C. Jasper of Yuha county, S. E. Wilson, Eli Davis, Thomas Brophy of Sutter, and others successively addressed the meeting, and with one accord all agreed with the first speakers.

A motion was then made and seconded that we form ourselves iuto an organization, to he called "The Anti-Debris Association of the Sacramento Valley." After considerable discussion, the motion was enthusiastically adopted without a dissenting voice. After this vote articles of agreement were considered hy which this society shall he governed. After adopting one or two, and evening coming on, it was found impossihle to finish the lahors of the meeting. Whereupou the meeting adjourned to meet next Saturday, August 31st, at 10 o'clock A. M., at the same place, to complete the organization.

At the meeting ou August 31st, articles of agreement were adopted, hinding the memhers to prosecute to final adjudication in the court of last resort any case now pending or that may hereafter he instituted for the purpose of determining the right of miners to use channels of rivers and their trihutaries as places of deposit for debris, thereby destroying large hodies of valley land, etc. The agreement also provides that memhers shall sign with an amount and agree to stand an assessment not exceediug three per cent. on said amount, for the purpose named. An assessahle valuation of ahout $170,000 was suhscribed at the meeting. The following named were elected Directors: James H. Keyes, B. F. Walton, C. P. Berry, S. E. Wilson and H. Ellmer. George Oleyer was elected Treasurer. The Directors organized hy eleeting Keyes president and Walton secretary. The meeting adjourned until Septemher 14th, at 1 o'clock.

PUBLIC LAND MATTERS.—Advices from Washington hy telegraph, announce that Secretary Schurz has reaffirmed his decision made last July, that the lands granted to railways, and not disposed of within three years after the completion of the roads, have become again Government property, and are subject to pre-emption, etc., like other Government lands. It is propable that the railroads will now take the issue to the Supreme Court. It is telegraphed that Secretary Schurz is ahout to issue a circular relating to trespasses upon Government timher lands.

DEATH OF GOVERNOR HAIGHT.—Ex-Governor H. H. Haight died in this city Septemher 2d, of disease of the heart. Aside from his discharge of the guhernatorial trust, he has heen prominent in this State for a numher of years, and has won the esteem of hoth his political friends and opponents. His death is generally regretted. He was a memher-elect of the coming Constitutional Convention.

THE iron-masters of West Scotland have agreed to notify their employes of a reduction of 10% in their wages.

DURING August the San Francisco mint coined 1,905,000 pieces; value, $5,609,000.

WHAT AND HOW?

In this column are printed all sensible inquiries relating to subjects connected with mining or relating to any matters of general scientific interest; also the answers to them as dictated by individual experience, or as furnished by correspondents.

Miners' Inch.

EDITORS PRESS:—(1) Will you state in the PRESS the numher of gallons of water discharged per minute or hour hy the "miner's inch?" (2) What velocity is a "six-inch" pressure equivalent to?—SHASTA.

(1) In round numbers the miners' inch is equivalent to a discharge of 95 cubic feet per hour; one cuhic foot is seven and a half gallons. A miner's inch would equal a discharge of 712.5 gallons per honr. For as full a discussion of the miner's inch as has ever, perhaps, heen puhlished, we direct you to the MINING AND SCIENTIFIC PRESS, Volume XXXV, No. 19, puhlished Novemher 10th, 1877. It is in the fifth article of a series on "Hydraulic Mining in California," hy Aug. J. Bowie, Jr., M. E. It can he seen from that how indefinite a term "miner's inch" is, and how arhitrarily its exact meaning is altered in different localities.

(2) This second question is very indefinite, as the velocity due to a six-inch head varies greatly with particular conditions. Calculating it in the most general way, the theoretical velocity acquired hy water in falling six inches, is 19.6 iuches per second.

Ione Clay.

EDITORS PRESS:—I send you two samples. I would like to know what they are and their value, if they have any. No 1, I think, is graphite or plumhago. The other is perhaps overlying coal clay. Please answer soon and ohlige.—D. H. W., miner and prospector, Ioue City, Amador Co., Sept. 1st, 1878.

Both of these specimens are simply clay, one of a much fiuer texture than the other. The finer clay, if it occurs in large quantities, may he of some use to hrickmskers and potters. J. S. Phillips found in it alumina, magnesia, silica, irou, and perhaps a little lime. We have not heen ahle yet to consult with brickmakers on the suhject. We will show them the samples at the earliest opportunity.

Infringement of Patent Suits.

Thomas Powell of Stockton, has filed a hill in equity in the U. S. Circuit Court, against Josiah K. Garrett of the same place, snd William Tierney of San Joaquin county, to recover damages for infringement on plaintiff's patent for improvements in derricks, and to enjoin further infringements of the same.

The Stetefelt Furnace company have filed a bill of complaint in the same Court against the Tip Top silver mining company, for an accounting for infringing plaintiff's patent "improved process of chlorodizing silver ore hy means of dropping a mixture of pulverized ore and salt through a vertical or nearly vertical shaft, through which the products of comhustion are ascending," and for a perpetual injunction.

John S. Winters of Davisville, Yolo county, has also filed a bill against Donald Crane, Henry David White, and Charles Gray White of Woodland, Yolo county, to recover damages for infringement of plaintiff's patent for improvements in wagon derricks, and to restrain the defendants from further infringing the same.

In the same Court, Andretta Goodwin and Charles G. Emery, tobacconists of New York, have filed a hill against J. Morris of this city, for an accounting and to enjoin the defendant from infringing plaintiff's trademark. Plaintiffs are msnufacturers of cigarettes, and their trademark is "Old Judge Cigarettes, Patented March 5th, 1878." The defendant is also a cigarette manufacturer, and he uses a trademark printed in the same form as that of the plaintiffs, using almost a counterpart cut, and the readingmatter is "Old George, warranted, June, 1878." It is alleged that the so-called imitation cigarettes manufactured hy the defendant, are put up in the same manner as those manufactured hy the plaintiffs, and that the defendant is guily of infringing their trademsrk.

BULLION SHIPMENTS.—Northern Bell, Aug. 26th, $4,129.24, 28th, $3,943.35, 31st, $4,963.28; Raymond & Ely, Aug. 24th, $11,987, 31st, $4,168.79; Tyho Con., Aug. 26th, $5,473.13, total to date, $56,523.03, 31st, $4,411.35, totsl for August, $60,934.38; Manhattan, Aug. 30th, $12,700; Leopard, Aug 30th, $3,400; California, Aug. 31st, $42,135, total to date, $158,848.94; Con. Virginia, Aug. 31st, $28,771.27, total to date, $152,506.39; Bodie, 31st, $25,000; Christy 30th, $5,653; McCrackin, 31st, $9,632.40; Extra, 31st, $2,822; Hackherry, 31st, $6,853.09; Alexander, Sept. 2d, $4,977.66; Moore's Flat, Aug. 26th, $12,000, Aug. 28th, $14,000; Black Jack, Silver City, Idaho, $7,787.08; Monarch, Atlanta, $7,475; Standard, Sept. 2d, 20,955.31.

NEW YORK sends over $100,000 to the yellow fever snfferers.

The Globe Gaslight Company of California.

Among the prominent features of the Fair, illustrating recent improvements introduced in our community, is the display of the "Globe Gaslight Company of California" of Shaler's self-generating gas carbnretters for private and public buildings, and also the Globe gas burner for streets and private grounds.

The system under which this company operates, is known as tho Shaler invention, properly secured hy letters patent, and comprises not only the appropriate mechanical contrivances, but a chemical process acting in conjunction therewith. Tho use of liquid hydrocarbon and especially petroleum and its products as a basc for the production of illuminating gas is no now thing ; but it is claimed that the system under consideration is superior to those heretofore in use. The common air, bronght by whatever means in contact, with gasoline or auy of the more volatile products of petroleum, becomes immediately impregnated with those lighter qualities, thus forming a new compound, highly combustiblo and possessed of great heating and illuminating power. In other words, acrated, or air gas, so called, is simply air charged to a certain degree with the lighter vapors of potroleum or any other hydrocarbon liquid. There is nothing new or mysterious in all this ; but tho manner of producing, treating and using this element, so as to render its nse at once safe and ecouomical, has been the study of many for a number of years.

Three different methods or machines have heretofore been invented and used in obtaiuing this illuminating gas from petroleum and its products: 1st—machines where steam or dry heat is used to generate the gas; 2d—machines in which a continuous columu of air is driven over the oil, all in ouo vessel; 3d—machiues where the fluid reservoir and carhureter are separated. The first of these is always more or less dangerous, and the others objectionable on account of their complicated or costly mechanism.

The Shaler system offers a perfectly automatic gas making carhureter, which, wheu one or all the burners are lighted, demands and obtains its own power without any machinery. The carbureters are self-acting in making the gas, and also in serving it out or shutting it off, without regard to the number of burners. The whole system is comprised in a single carbureter, which is made to act in the two-fold capacity of generator and reservoir. Being provided with means of repleuishment and two ordinary stop-cocks, one to regulate admission of air, and the other the flow of gas through the reservoir pipe, the thing is complete. There are no air-pumps, weights or pulleys, no power, machinery or skilled workmen nccessary. The engraving on this page shows one of the carbureters. It is a square tank, substantially made of galvanized iron, with a flat hottom and cone-shaped top. In the centre of the top is an opening, guarded by a stop-cock, for the purpose of admitting air. In the end of the tank, above the centre, is an opening, where the gas passes out into the supply pipes. The interior of the carhureter is divided in chambers, and amply supplied with cotton wicking, to hold naptha or gasoline by the power of capillary attraction, so that as the air passes through the carbnreter it becomes saturated with naptha or gasoline. The stop-cock being opened at the top of the carbureter—which has previously been charged with naptha—the cock at the end where the supply pipe is attached is opened, when the air inside the carbureter, which has become impregnated with naptha, and therehy increased in weight, is, by its specific gravity, drawn down and carried away, wherever the pipe may lead, to supply light. The demand will regulate the supply, for as the carbureted air is consumed, more comes to supply the place. This, in effect, is the whole apparatus, which may be attached to the ordinary gas pipes in the house.

By this plan there is no danger of explosion, as there are no tanks filled with combustible liquid or gas, the latter being generated only just as fast as may be required for use, while not a drop of gasoline is anywhere held in fluid shape. All the liquid is held in complete absorption hy the cotton wicking, so that even if the apparatus should be thrown down from its position, or smashed to pieces, there is no accumulation of gas or inflammable liquid to come in contact with fire and cause danger to life and property.

This apparatus produces a gas of 18 candle power, at a cost of $1.50 per 1,000 cubic feet. The material needs only to be replenished in common sized carbureters at intervals of from seven to ten days, according to size of carbureter and number of hurners used. The material used is cheap and easily procured, and there is little more trouble in caring for the apparatus than in looking out for a kerosene lamp.

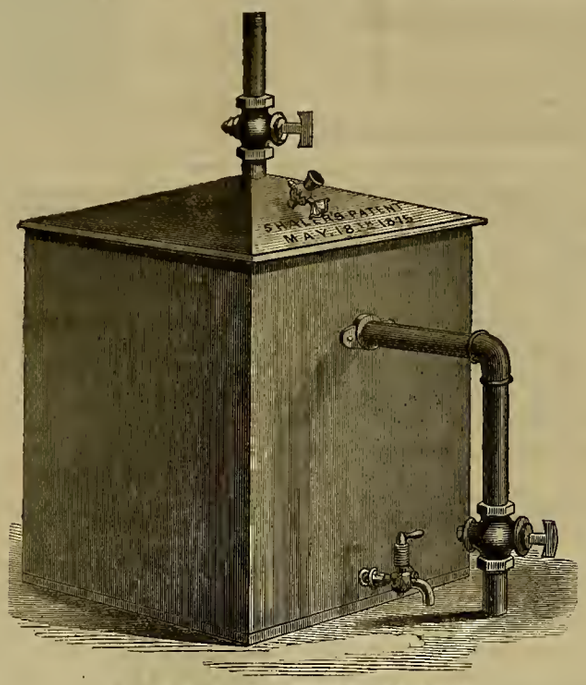
Judging from the illumination produced at the Pavilion, the light is equal if not superior to coal gas. There is great steadiness of flame, because of the light and uniform pressure. For country residences, factories, and even small villages, the apparatus is peculiar adapted, its limited cost bringing it within the reach of many heretofore debarred from the luxury of gas light. A portable carbureter is made also, which is intended to light a single burner on a stand, rubber tubing being used for connection.

The company also make a peculiar patent safety can for carrying, handling and storing purposes. It is on the principlo of the Humphrey Davy lamps; that is, a wiro gauze is arranged at the top opening and spout of the can so that no fire can be communicated to the contents of the can, which is also the can in the carbureter. Tho company also display the

Globe Gas Burner for Street Lighting.

This is a miniature gas machine of itself, but differs from all others in several important particulars. It has no wicking of any kind, and superheats the gas in a peculiar manner, the flame being successfully regulated. It has also a water trap, which prevents any water of condensation entering the burner, this being especially useful in cold countries. It is suited to any climate, and will burn successfully in the coldest or most boisterous weather, furnishing a clear gas light.

The engraving shows the method of construction. Each light has its own receiver attached to the lantern, which contains the



GLOBE GAS COMPANY'S CARBURETER.

fluid, thus doing away with all service pipes and mains, and the duration of the light can be graduated to any given number hours, going out itself at the time desired. The receiver needs to be replenished at specific intervals, and no further care is required. The material used is redistilled Globe naptha, one pint of which will give at least five hours of beautiful light. For parks and private grouuds this is a perfect and ecouomical light. It is in use in a number of Eastern cities, and was last year adopted by the cities of Napa and San Jose on this coast, where it is in successful operatiou. It is also used in the State's Prison yard at San Quentin. The utility of this hurner and system for the purposes indicated will readily be recognized by all.

Globe Gas Street Lamp.

Repeated thorough tests have been made with this apparatus to determine its safety under trying conditions, such as changing the contents while the gas was hurning; lighting a can at the mouth and putting it out with the open hand; lighting the can and dropping it, etc. The company here, the office of which is at 515 Market street, is now introducing the apparatus extensively on this coast. The President is Mr. Israel W. Knox, and the Secretary Mr. J. B. Meeks.

The clearances at the San Francisco Clearance House for the week ending August 31st, amounted to $19,466,018, against $17,120,760 the previous week, and $11,856,100 for the corresponding week in 1877.

Eastern capitalists have invested about $30,000 in old Oregon mining claims, and will take up some new ones besides.

The Improved Revolving Lawn Sprinkler.

We illustrate herewith the "Perfection Revolving Lawn and Garden Sprinkler and Fountain," lately patented and just introduced on this coast by Dunbam, Carrigan & Co., of this city. This little device is the most convenient of the lawn sprinklers yet brought before the public. The engraving shows the full size for a three-fourth garden hose, which is the size in common use. The hose is screwed into the socket on the side of the sprinkler (no nozzle being used) and the pin is pushed into the sod. The water is then turned on from the faucet, and the top of the sprinkler begins to revolve, one of the holes in the top being bored at an angle so that this motion is imparted. The water running from the other holes is spread in drops in a circle, the diameter of which is 25 feet. If a smaller space only is to be watered, the width of the watered circle is reduced by lessening the flow of water at the faucet. The writer has tried one of these sprinklers and found it the best of any similar device he has used. The sprinklers are made of pewter, but the journals are of brass so that they are durable and strong. Being sold for $1.25, and doing as much as any sprinkler made, they are being very rapidly introduced for use in gardens and

The "Perfection" Lawn Sprinkler.

lawns. Being low on the ground they have the appearance of a miniature fountain when at work.

Rich diggings have been discovered in "Horsefly" county, Carihoo. Chinese miners are making from $40 to $86 to the hand, daily.

T. G. Bilty of Greenwood, El Dorado county, recently sold a gravel mine to some Eastern capitalists for $50,000.

A New Elevator Hoist.

In the machinery department at the Fair, Messrs. Hawkins & Cantrell exhibit one of their improved elevator hoists, invented by William Hawkins, one of the firm. The machine comprises a new combination of mechanical principles and is very simple, the only wonder being, as in many other cases, that some one has not thought of the application before. In brief it consists in the employment of a screw shaft having a nut or cross head, which is caused to travel from end to end by rotation of the shaft. This nut is connected by suitable wire ropes with drums or pulleys for multiplying the motion given by the screw and to connect with the elevator drum. The elevator cage, guides, rope, pulleys, etc., are not essentially different from those employed in other hoists, and may be used equally well with this device. The screw shaft is horizontal, with journals turning in boxes at each end, the rear end being fitted with suitable thrust bearings. The threads in the screw shaft are cut of a pitch sufficient to move a traveling cross head or nut at the proper rate of speed. The traveling cross head has a guide or guides, and the ropes from the drum are attached by bolts to the cross head, which has a brass nutbushing, so that as the screw shaft is rotated the traveling cross head is drawn outward, the drum and pulley rotated and the cage elevated; when the nut is moved inward the cage is lowered. The screw may be driven in any manner desirable, by belt connection or directly by small engines.

Several of these machines are now at work in this city, one having been put on the Baldwin Hotel lately. At the fair the hoist is run by a belt and operates a small elevator, simply to show its operation. By the use of this device the load will stop anywhere without being held by the engine. It is absolutely noiseless, there not being a gear wheel in the machine, so that it is in this respect alone superior to elevator hoists generally. The usual arrangements for stopping and reversing can he used, but the stoppage or start is accomplished without any jar or suddenness, which is usually an objectionable feature in elevators.

The amount of hoist is of course regulated by the length of screw, but the whole device does not take up very much room. For sidewalk hoists this device can be made effective to be worked by hand and will occupy very little room.

Of course, with this screw device the load can be stopped at any point, an important feature with sidewalk hoists as no brake need be applied.

A Simple Appliance of an Old Principle.

It has seldom been our lot to observe so simple an appliance of an old principle in mechanics as that shown by Mr. James Mendenhall, at the Mechanics' Fair Pavilion. It is a self-shutting gate that cannot "sag," and at the same time one that is so simple that it cannot get out of order, unless it is put together with tow strings and wooden pegs, and the running-gear laid loose on the ground. The principle is that of the inclined plane or wedge, and when the gate is opened it is simply slid back on an inclined plane, a four-foot gate raising about three inches. The frame work exteuds up high enough, so that the front of the gate hangs on a sheave running on a plane parallel to that upon which the heel of the gate runs in a similar manner. The sheaves may run on iron or wood, or a gate that is but little used can run on hard wood with no sheave, provided the runways were kept well oiled and a little elbow grease applied.

This is one of those inventions where the actual practical article operates even better than a model, for it is evident to any one that the heavier the gate the less the incline would have to be to insure its closing itself. The sagging of the gate is entirely prevented by the fact that it rests upon two opposite corners, and really has as little inducement to settle, as it would were it set solid upon the ground. Another good feature is the fact that it is so constructed that the sheaves are entirely protected from the weather, and consequently unaffected by it.

The double self-opening gate by the same inventor is but little more complicated, a working model of which is shown in connection with the small gate above mentioned. The gate is double, opening right and left, upon inclined planes, and a single upright lever, worked by a cord from either side the fence, is the means of operating the gates. The lever connects with cords passing over two pulleys each, and a person desiring to pass through has only to drive up to the gate, pull the cord and pass on, the gates opening, and closing after him as soon as he relaxes his hold on the cord.

The advantage this gate has over others, lies in the inclined plane for closing it, and the fact that the one lever operates it from either side. The invention was patented through the Mining and Scientific Press Patent Agency, July 2d, 1878, and Mr. Mendenhall desires to sell territory to agents. He can be addressed through the medium of Dewey & Co., 202 Sansome street, San Francisco.

Hardee, Florida's scientist, advances the theory that yellow fever can he destroyed by atmospheric concussion, caused by explosion of gunpowder.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the lar gest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, $2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

THE EXPLORERS,' MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 672 pages and 83 engravings. By J. S. Phillips, M. E. Price—cloth, $10.50; in leather, $12; postage 50 cents. Sold at this office.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

GOOD LAND

—IN A—

FAVORABLE LOCATION,

GUARANTEEING

Sure Crops Every Year.

The Reading Ranch,

In the Upper Sacramento Valley, originally embracing over 26,000 acres of

Choice Grain, Orchard and Pasture Land,

Is now offered for sale at low prices and on favorable terms of payment,

In Sub-Divisions to Suit Purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends some 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is very healthful and comparatively desirable. The near proximity of high mountain peaks gives cool nights during the "heated terms" which occur in our California summers.

Soft well water—remarkably sweet, pure and healthy—is obtainable at a depth of from 15 to 35 feet.

Wood is plentiful and easy to get.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract. Also, Vegetables, Corn and all other cereals ordinarily grown in the State.

A considerable amount of the rich bottom land has already been cultivated.

Deep Soil With Lasting Qualities.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading—all of which are located within the limits of the ranch.

For Colonies.

Land suitable for settlers in colonies can be obtained on good terms.

Town Lots

Are offered for sale in Reading, situated on the Sacramento River, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

FOR SALE.

One Engine, 16 by 36 Inchee, Link Motion.
One Engine, 14 by 30 Inches, Link Motion.
One Engine, 12 by 24 Inchee.
One Engine, 9 by 18 Inches.

☞ Boilers to match each Engine. Each of the above will be sold at a very low figure.

ROBERT M. CONE, 226 Fremont St., S. F.

ST. CHARLES HOTEL,

SANTA CRUZ, CAL.

JOSEPH BLOCH, - - Proprietor.

This popular House, having been thoroughly refurnished and refitted, is now open for the reception of guests as a

FIRST-CLASS HOUSE,

And in the character of its accommodations second to no interior Hotel in the State.

The Hotel Coach will carry passengers from all Trains and Steamers to the House

FREE OF CHARGE.

Two lines of Street Cars pass the Hotel to the Beach and Bath Houses.

SUSPENDED WIRE ROPE TRAMWAYS.

This system of transport is peculiarly adapted for the carriage of minerals over rough countries. Heavy gradients and long spans easily overcome, and cheaper than by any ordinary means.

Transmission of Power by Wire Ropes.

The power of water or steam can by this means be carried for long distances, with great economy.

For estimates and practical information apply to

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

KING ENGINE.

The Only SAFE BOILER.

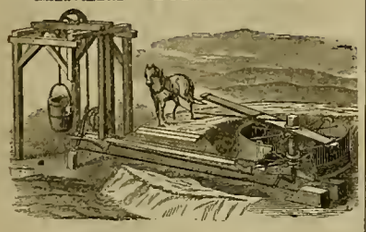
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street, San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 3 50
One man, per day	3 00
Wood, 1¼ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

JUDGE WM. WEBSTER, Paymaster Mine, Reno, Nev.
LEWIS CHALMERS, Manager Exchequer and IXL Mines, Silver Mountain, Cal.

Mining Share Market.

This week, the first of the now month, seems to anger a repetition of the activity that characterized the 30 days just passed. During last month the rise in some stocks amounted to 100%, 200%, 600% and even 900%. For instance, Sierra Nevada, on July 27th, was $8.12½, and on August 29th, $85, an advance of $76.87½. Bodie advanced in the same time from $11 to $50. There were of course several declines, but none that were very startling. One of these was at the close of the month, in fact, on tho very last day, August 31st. On Friday last, Ophir was $48; on Saturday, $41.50; Mexican went from $32.50 to $24.50; Justice, from $9.25 to $7.87½; Julia from $10.25 to $8.50; Union Con., from $41 to $30.50; Sierra Nevada, from $65.50 to $48.50. As is usual, sympathy exerted itself, and the whole Comstock shared in some measure tho decline.

But at the opening of a now week and a new month the decline changed into a riso. Ophir on Tuesday had risen to $43.25, Mexican had reached $35, Justice $9.50. Julia fell lower Monday, but revived again Tuesday. Union Con. reached $66, and Sierra Nevada had made a jump to $98.50.

This rise may have grown out of the reports of the experts who visited the mines on Friday. If so, it was long in coming. And as a general thing the visits appear to have led to little outside enlightenment, although an impression seems to have existed that the examiners could make favorable reports if they wished. However that may bo, no doubt the ball was started up hill by Bonnemort's report on Monday that there was good ore in the 2100-foot level of Sierra Nevada. Tuesday the excitement was in no wise allayed by the rumor that the average Sierra Nevada assay was between $300 and $400 per ton. It has been thought by many that a new Bonanza era is commenced, and Sierra Nevada is at present the attractive point for those who watch and wait.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING AUGUST 20TH, 1878.

RATCHET WRENCHES—Thos. Clement Hammond, Sacramento, Cal.

GRIPPERS FOR WIRE ROPE RAILWAYS.—Johan Hansen, S. F.

PROCESS FOR WELDING COPPER—R. P. Williams and L. Worsham, Alameda, Cal.

MINING RIFFLES—Chas. O. Bagley, S. F.

RAILWAY RAIL JOINTS—Samuel E. Hilliard, Reno, Nev.

BLIND-WIRING MACHINES—Carl Hinz, S. F.

BERRY BOXES—Roswell E. Morey and Thomas H McDonald, S. F.

HARNESS SADDLES—John Patten, Tomales, Cal.

METALLIC WHEELBARROWS—John Upstone, S. F.

STEAM PUMPS—Philip Van Tassel and Martin Paup, Port Madison, W. T.

WASHING MACHINES—Toliver A. Wilson, S. F.

DEVICE FOR DRIVING NAILS UNDER WATER—William Stack, Oakland, Cal.

TRADE-MARKS—California Cigar Box Co., S. F., cigars

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

UNION READING ROOMS, FIRST STREET, SAN JOSE. WELCOME TO ALL!—Having lately been removed to the old hall of the City Zouaves, this institution is located in a pleasant and spacious apartment. The latest and best periodicals of the day are found on its tables, free to all. Also many choice volumes upon its shelves. Good music is provided for every Wednesday evening's social. Admission [to these entertainments, 25 cents—to pay expenses.

[Communicated.]

The Pacific Mineral Land Company.

A company will shortly be incorporated, under the above name, in this city with a large capital stock, for the purpose of acquiring and working mineral land on the Pacific coast of the United States and adjoining countries. The company will mine coal, iron, silver, gold and other minerals, sink petroleum wells, make coke and establish iron manufactories, build railroads where necessary, own and run steamers, and seek in every profitable manner to develop the resources of this coast.

A gentleman of life-long practical experience in the coal and petroleum regions of the East will devote his services to the company as President. A special feature will be made of coal, the safest and most lasting of all the minerals. Arrangements have already been made for the acquisition of valuable and accessible coal fields on the northern part of the coast, work on which will be commenced without delay. It is intended before New Year's to lay down coal of the best quality in San Francisco at lower price than has yet been done. The company will arrange for the immediate construction of large and powerful steamers suited for carrying coal, merchandise and passengers, thus ensuring the shipping of their coal at a small expense.

A sufficient working capital for all purposes will render further calls on the stockholders unnecessary, and no assessment will be levied on the stock. Every facility will at all times be offered for full examination of the company's affairs by individual shareholders. Gentlemen well and honorably known both here and in the East are interested in the undertaking, and their names are a guarantee that the affairs of the company will be conducted in a perfectly fair and honorable manner. A large amount of stock has already been applied for in this country and in Europe.

This will be the strongest company ever organized on this coast, and offers unequaled inducements for the safe and profitable investment of capital, the stability and sure rise in value of real estate being here combined with the profits of mining and manufacturing, whilst the variety of operations to be carried on reduces the risk to a minimum.

Further particulars will be announced in these columns in the course of a few weeks.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

Gover Mining & Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of August, 1878, an assessment (No. 37,) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Monday, September 23rd, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, October 21st, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal

Keystone Quartz Mining Company.—Principal place of business, San Francisco, California. Location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of August, 1878, an assessment of fifty (50c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at the office of the Company, northwest corner Pine and Sansome streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of October, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-eighth day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, northwest corner Pine and Sansome streets, San Francisco, California

Mariposa Land and Mining Company of California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, California.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 14) levied on the tenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Directors, made on the tenth day of July, 1878, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on Monday, the ninth day of September, 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. LEANDER LEAVITT, Sec'y.

Office, Room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

POSTPONEMENT.—The above sale is postponed until Wednesday, the twenty-fifth day of September, 1878, at the same hour and place.

By order of the Board of Directors.

LEANDER LEAVITT, Sec'y.

Pocahontas Gold Mining Company.—Location of Principal Place of Business, San Francisco, California. Location of Works, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of August, 1878, an assessment (No. 14) of One Dollar and a Half ($1.50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 9, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Wednesday, the 23rd day of October, 1878, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors M. C. SOUTHARD, Sec'y.

Office, Room No. 9, 411½ California street, San Francisco, California.

Telegraph Copper and Silver Mining Company. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gopher Mining District, Calaveras County, California.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 1,) levied on the seventeenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No Certificate.	No. Shares.	Am't.
Howland, W H	Not issued	1350⅔	$ 40 52
Jones, C C	Not issued	5640	160 20
McCrea, Wm	Not issued	4909	149 97
Bollinger, J C	Not issued	17,166	514 98

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of July, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 2, 528 California street, San Francsico, California, on Monday, the ninth (9th) day of September, 1878, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. T. MILLIKEN, Secretary.

Office, Room 2, No 528 California street, San Francisco, California.

Vigorit Powder Company.—Location of works, California City, Marin County, State of California. Location of principal place of business, City and County of San Francisco, California.

Notice is hereby given that at a meetiug of the Directors held on the first day of August, 1878, an assessment (No. 1) of fifty cents (50c.) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 1, 109 California street, in the City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Thursday, the twelfth day of September, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the second day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expense of sale.

JAS. W. BAKER, Sec'y.

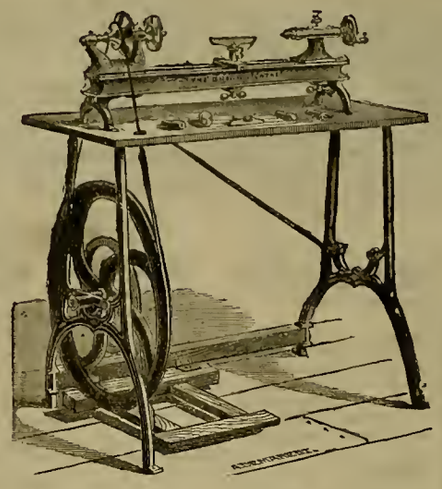
THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone-pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur ce ter for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

—FOR SALE BY—

DUNHAM, CARRIGAN & CO.

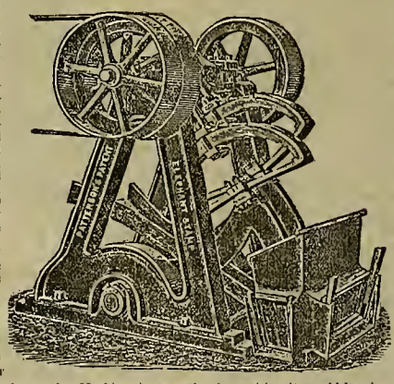
SAN FRANCISCO.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the "Elephant Ore Stamp." The advantages claimed for this Stamp are as follows:

Capabilities.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

Wear.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.



Power.—The "Elephant only requires a seven horse power Engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

Portability.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the Machine is comparatively easy, and in places where it would be necessary to pack the Machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

DEWEY & CO.
American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

BANDMANN, NIELSEN & CO., San Francisco.

To Mill and Mine Owners.

Having complete arrangements with competent and reliable parties in Washington City, by which we are able to secure prompt and careful attention to law business there, we are prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our general line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys), will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to personally by a member of our firm, and satisfaction will be given in all respects.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

PIOCHE, Nev., Aug. 17th, 1878.

MESSRS. DEWEY & CO.—*Dear Sirs*—My letters patent for car brake through your Agency has been duly received, for which please accept my many thanks. And allow me to say that your valuable advice so kindly tendered to inventors through your MINING AND SCIENTIFIC PRESS and circulars, together with the brevity and promptness of your action in securing letters patent to applicants, cannot be too highly endorsed. Again thanking you, I subscribe myself obedjently one among your many friends. Respectfully, H. H. GARRISON.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 14, 1878.

VOLUME XXXVII Number 11.

Kitchen and Parlor Hardware.

Those who have cooked with "Dutch ovens" nnd old-fashionod stoves even, know how to appreciate Van's patent portablo French ranges, with their water-heaters, warm closets, etc., Second only to them come the Eureka and Family ranges, of which they have sixteen sizes, and other improved cooking apparatus.

These ranges, adapted as they are for wood or coal burning, aro cconomical in fuel, saving in time and labor, and dispense with the vexation of spirit that distresses the housewife when working with the old, red hot or stone-cold stove.

Something new is Van's pastry steam stove. The stove is surmounted hy hot water vessels, which generate the steam which is used for cooking vegetables, which is a great convenience, as they can he left in the vessels for hours after cooking, without detriment to flavor or quality. The oven is large, and can bo used for pies, cakes, etc. Waffle-irons and cake-griddle, fill np the space over the fire, and all cooking goes on at once without conflict or burning.

Van's new Ward carving-table is an achievement in culinary science. Furnished with planished tin soup-tureen, chafing dishes, water-pan and large and small dishes, covered, and two-burner gas pipe, meats can be carved and kept warm on it for any length of time. Heat can be supplied by steam, gas or coal oil stove, and it is altogether a handsome and convenient accessory to the kitchen of any hotel, restaurant or private house, and vastly superior to the old-fashioned cooking stoves so much in vogue heretofore. A steady, even heat *in* a range, not outside of it, is what is desirable, and Messrs. Montague & Co. never hand in any range that will not give this desideratum.

Van's coffee-urn is the result of study and experiment for years, and is an invaluable adjunct to the kitchen of every restaurant and hotel, and, indeed, is not out of place in large private establishments. It distills coffee, and keeps it n nll its aroma, strength and freshness, for twenty-four hours, and is therefore economical. Every known utensil of kitchen and dining-table, except knives, forks and spoons, can be made of this ware.

It is well known that many of the compounds used to line iron vessels for kitchen use are failures; but such a word inscribed upon any experiment, only serves to incite the Yankee inventor and chemist to fresh endeavor, and the granite iron-stone ware is the result. Of course, if you heat a cast-iron kettle red hot and plunge it into cold water, something will break, hut nny abuse short of this does not affect the granite iron-stone. Even had it no superiority, such as its resistance to aeids, etc., its beauty alone should render its sale immense.

Marbleized iron mantles excite at present considerable attention. They are worthy of it. For they combine with great cheapness, a beauty which is welcome about any fire-place. They are made of at least twenty patterns. The imitations of black walnut and laurel are said to be particularly beautiful.

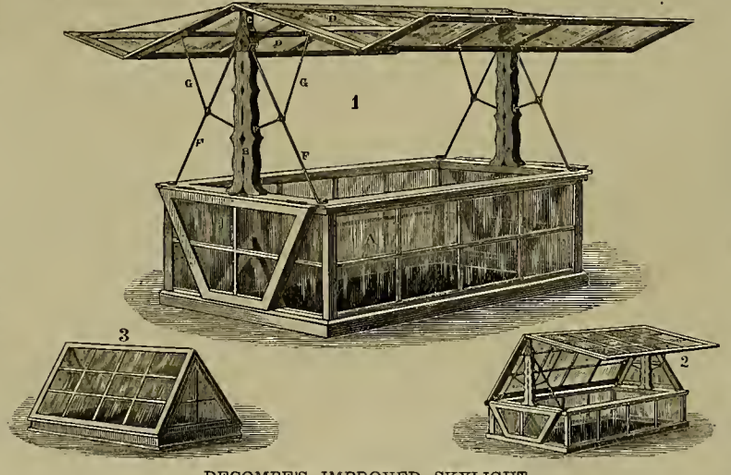
Messrs. Montague & Co. can supply any demand in the line of stoves, ranges, hardware, iron, steel, mining and milling supplies, etc., from their large establishment at the junction of Market and Bush streets in this city, and No. 52 to 58 J street, Sacramento.

Postal Changes.—Offices discontinued, Sargent, Santa Clara county, Cal. Postmasters appointed, John C. Flood, Alemo, Contra Costa county, Cal.; David L. Kent, Felton, Santa Cruz county, Cal.; Henry H. Sheldon, Sutro, Lyon county, Nev.; George Cruise, Bethel, Polk county, Oregon; John P. Roberts, Bonanza, Lake county, Oregon; John Hanks, Day's Creek, Douglass county, Oregon; J. W. Hanaker, Linkville, Lyon county, Oregon.

The Silver Peak mines, Esmeralda county, Nev., are working well and the mill running steadily. The clean-up for the three months ending August 31st, we are informed, showed a snving of 94% of hoth gold and silver contained in the rock. Proportion of silver to gold, ten to one. The bullion shipped during the month of August amounted to $16,451.90.

Decombe's Universal Ventilator, Sky-Light, and Exhibitor.

Joseph Decombe, of this city, who has recently patented through the Mining and Scientific Press Patent Agency an improved sky-light, which is represented in the engravings shown herewith. *It* represents the lower portion of the sky-light. The vertical end timbers, *B*, are extended upwards, as shown, and their upper ends are formed of metal, by the extension, *C*, heing formed with a socket, whieh fits over the ends of the timbers, *B*. Each side of the cover or top, *D*, is made with rafter and glass; but the rafters are fastened at top and bottom to horizontal timbers, which work each side of the top or roof separate and distinct from the main structure, these horizontal timhers not being secured to either plates or apex permauently. Through its upper iron portion, *C*, of the end timbers, *B*, are pivoted the holts, forming part of the hinges, attached to the



DECOMBE'S IMPROVED SKYLIGHT.

sides of the top. These hinges admit of the sides of top being raised or opened, as the lower edges of the rafters are not secured to the plates.

The side hraces, *F*, are secured to the plates of the lower portion and to the lower portion of the arm extension, *C*, of the uprights, thus forming hraces for the uprights and drawing the extension pieces, *C*, firmly into place, where they hold them. On these side braces, *F*, are pivoted the hinged braces, *G*, whieh, when not in use, hang down under the side braces, *F*. When the top is raised, however, these hinged braces, *G*, having their outer ends turned at right angles, as shown, engage with the holes in the plate on the under part of the sides of the roof, as shown in Fig. 1, and on one side of Fig. 2. The hinged hrace may then be put in any hole in the plate, so as to set the top at any angle. When it is desired to close the top by lifting this brace out of the holes in the plate, the top may be lowered and closed as shown in Fig. 3.

The gables are also hinged so as to be dropped down. When they are up, however, and the top dropped, the top covers the laps of the sides or gables and holds them in position as shown in Fig. 3.

It will be seen that the combination of braces in this at once renders it very strong, and that the roof can he set at any desired angle. The roof can be set so as to cause a draft of air to pass either one way or another. Only one side need to be raised, if desired, as shown in Fig. 3,

This same construction may be applied for portable houses, fruit and vegetable stands, etc. In such cases with a wooden or cloth roof, the side from the sun can be secured and the front be placed on the stand in the shade. The sides can bo dropped so as to be locked at night.

This invention serves the purpose not only of a sky-light, hut is adapted in a marked degree for use as an exhibitor and ventilator. Shelves may be arranged under the glass, on which any artiele may he placed for exhibition in public places. The roof may be lifted out of the way during the exhibit and afterward shut down and locked for safe keeping without disarranging the articles within. As a ventilator this iuvention claims advantages over all others. The different parts move independently, so that they may bc arranged in many different ways, according to the state of the weather. If the day is warm aud air is wanted in the house, even a light breeze can be made to descend and all of it used in cooling the apartments. Suppose, for instance, the breeze blows diagonally across the sky-light. It may be collected and sent down by arranging the parts as follows: Put up one end piece and shut down one roof piece, so that a corner will be formed, opened toward the wind. The wind rushing into this corner and against the inclined roof piece will be collected and shot vertically down into the house. It is evident thnt an infinite number of combinations are possible, according to the strength of the wind and the amount of air wanted below. On very hot and quiet days the full ventilating capacity of this invention can be utilized and at the same time the whole of the top covered, so that a full shade is obtained along with as much air as possible. Rain will not prevent ventilation, for the parts may be so fixed that openings will be presented only in such positions that the rain, coming from one direction only, cannot enter. So this patent provides for protection from rain and too great light, and at the same time affords most complete ventilation.

A Powerful, Economic Press.

The Boomer & Boschert cider press possesses many advantages which those interested in such matters can gather from the following description.

The grater is simply an iron cylinder slotted, or having plain grooves into whicb the knives are set, and adjustable steel springs press the apples against the swift revolving knives, so that they are pared down in shavings, as it were, instead of being crushed as with most grinding machines. Much more juice is obtainable with this process than with the old style of crushing, as nearly every cell in the fruit is broken, and the juice therefrom liberated and more easily expressed.

Turning, then, to the press, we find a machine whose power is only limited by its strength—not by the power applied, so to speak, for as the follower is run down in closer contact with the "cheese," the power increases in proportion to the resistance. The double screw and knee joint worked by the balance wheel at first, and by the lever pawl and racket as the resistance becomes greater, is the speediest and most powerful method of compression known except it be the hydraulic system. Two men on a small press can exert a pressure of 75 tons.

The principle of its working is such that as the resistance of the pulp becomes greater from its becoming solidified by pressure, the follower goes down more slowly, so that more turns of the screw are requisite for each niche of fall, and therefore the resistance and power continually equallize themselves. Fitted up with its cheese cloths and racks this cider press can hardly be equaled by anything in the market for its purposes. A. L. Fish & Co., who have it on sale, also show an exceedingly fine steam fire engine, that challenges the world for workmanship, beauty and power, and which has been awarded medals at the Philadelphia exhibition, Portland, Mobile and several other places.

This firm keep a large assortment of engines, Knowles' pumps, etc., on hand at their establishment on First street, and can supply any order entrusted to their hands.

Instructions Regarding Railroad Lands.

A circular of instructions has been issued by the Commissioner of the General Land Office under the recent decision of the Secretary of Interior in the Dadymott case, and is addressed to Registers and Receivers of United States District Land Offices. The Commissioner's instructions apply only to lands granted by the Act of July 1, 1862, as amended by the Act of July 2, 1864, and the Act of March 3, 1869, authorizing the transfer of a part of the grant to the Union Pacific Railway Company. Where any person shall apply to file a pre-emption declaratory statement for a tract or tracts not exceeding a quarter section within the limits of such grant, and when the entire roads shall have been completed for more than three years, such applicant will be required to show that he or she is duly qualified as pre-emptor. Thereupon the declaratory statement will be conditionally received, and a proper note thereof made. You will immediately thereafter call upon the proper officers of the railroad company for a statement showing whether the lands applied for bad been sold by it prior to the date of application to file a declaratory statement therefor. If the company shall report that the land had been sold, the report must show the date of such sale and the name of the person or persons to whom sold, and give a description of the deed or instrument of conveyance. On receipt of such report, you will reject the application to file a declaratory statement, subject to appeal to this office. If the company shall state that the land had not been so sold, you will admit the declaratory statement, and upon application showing at the proper time a full compliance with the requirements of the pre-emption laws, permit payment at entry at $1.25 per acre.

Following is a list of the companies whose grants are clearly under or subject to the terms of the Act of July 1st, 1862, with the date of the completion of each road, as appears from the records of the Department:

Union Pacific Railway—Completed July 15th, 1869.

Kansas Pacific Railway—Completed October 19th, 1872.

Union Pacific Central Branch—Completed January 20th, 1872.

Denver Pacific Railroad—Completed May 2nd, 1872.

Sioux City and Pacific Railroad—Completed March 2nd, 1869.

Central Pacific Railroad—Completed July 19th, 1869.

Western Pacific Railroad—Completed January 21st, 1870.

The State Government of the United States of Colombia gives 50,000 people four polling places and then fires on them if in the crowd and excitement there is any disturbance. The election goes for the government.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Scenes in the High Sierra back of Yosemite.—No. 1.

[Written for the PRESS by J. G. LEMMON.]

Joy, wonder, exhaustion! I have just returned from a two weeks' exploration, alone, of the high Sierra back of Yosemite, 20 to 50 miles. The trip included the ascent of the world-famous Half-dome by means of a rope for the upper 900 feet, the lofty and never-before-surmounted Lyell group of peaks, and lastly, the culminating peak of this region, Mt. Dana. The exploration was a grand round of labor, exposure and pleasure. The striking views met with must accompany me through life.

Pinnacles of splintered rocks shooting skyward over 13,000 feet; vast amphitheaters scooped out of their bases by volcanic forces in the old ages, now half filled with perpetual snow, each mass resting upon a living glacier grinding its way down to limpid lakes at the present melting point, and carrying on its back scattered rocks as they fall away from the pinnacles in the never-ending process of disintegration; semi-circular moraines of these rocks arranged in curved parallels across canyons and valleys, for miles on miles, or waving lines of medial moraines threading the valleys, showing the dividing line between two glaciers; bright bands of sheen striping, forest-denuded mountain sides, showing where scoured the mighty ice masses in the old geologic æons, plowing the present Sierra valleys; noble forests of pine, fir and spruce, filling the worn, sheltered slopes, or strange, almost unrecognizable trees, sparsely fringing rock clefts of high spurs or depressed flat, to lichen-covered rocks by the ever-blowing winds of high passes; brilliant gardens of rare flowers studding sunny alpine slopes, or, more interesting still, new, undescribed flowers peeping from out bare terminal pinnacles upon these interesting objects; and on such as these, I have gazed enraptured, among them climbed bewildered, for a whole fortnight of red-letter days.

Of all the tourists and scientists in Yosemite I could get none to join me in the exploration I had planned. It was vain to pause regretting the absence of those who *would* accompany me had they been privileged to be here; so, packing my trusty and strong horse, "Stanley," with blankets, provisions, botanical papers and pick, I hastened away alone, taking the trail up the middle alcove of the Yosemite gallery, past the two grandest falls, Vernal and Nevada, to the upper Yosemite valley back of South Dome and Cloud's Rest. This upper valley would be a great wonder anywhere else, being walled and embossed with similar rocks and domes as the great Yosemite, but not so lofty. Its floor is clothed with a richer forest, owing to its greater elevation, 6,000 feet. The upper portion is fenced across by a high, strong fence of cedar rails, and contains some excellent meadows, the pasture grounds of Washburn & Bruce, the enterprising owners of the Mariposa Big Tree station. Between these valleys rise up three much visited and often portrayed objects: Cap of Liberty, Half-dome and Cloud's Rest. The first and last of these are easily climbed; but the Half-dome, an oblate, flattened mass of granite, protruding edgewise from the wooded mountain tops and split in twain logitudinally, has, until lately, defied all attempts at surmounting. But an ambitious, keen-eyed, cool-headed, sure-footed Scotch sailor named Anderson has compassed its ascent, and assisted by him a few daring spirits have climbed up the rope which he has fastened with iron pins driven into holes drilled into the rock, a most perilous and laborious work. He has prepared the material for a wooden stairway to the summit, but for some reason the completion of the enterprise is postponed.

It was by the merest accident that I ascended the famous throne of "Tis-sa-ack," the Half-dome, the cynosure of all eyes at Yosemite, and without doubt the most striking natural object yet discovered on our planet.

Leaving my baggage in camp at Little Yosemite valley, I started on the morning of August 14th up the trail leading to the base of the dome. When near the cabin of Anderson (of which I was ignorant at the time) my spirited horse, suddenly hurrying up a short steep, so shrunk in his body that the saddle girth slid back, causing him to take fright and to rear and plunge, finally landing me upon the rocks, badly spraining my back. For a few minutes I lay helpless, while "Stanley," still rearing and kicking, cleared himself of saddle, blanket, etc. With difficulty I rose, recovered horse and equipments, some of the latter sent hurling far down the slope. I resaddled the horse, mounted from a convenient, jutting rock, and rode on *up* the trail, determined at least to *see* the heroic achievement of Anderson.

In a few minutes a rude whip-saw mill, then a small log cabin came in sight. I rode up and hailed. A man came out, took in the situation at once by a glance at my pale face, lifted me off the horse and carried me into the cabin, where a herth of pine boughs and a cup of coffee soon began the work of restoration.

In a few minutes a fellow dariog spirit and coworker of Anderson's, Mr. J. B. Lamhert, came in, and at ouce he placed me right at home with rude but true and characteristic travelers' hospitality.

Learning that I was a botanist, Lamhert questioned me closely conceruing the trees of the vicinity, and urged a short walk among them, proffering his arm. By chance we wandered up the slope, talking about and studying the trees. Accideutally we fell into the trail, and at length reached the hare, steep dome that flanks "Tis-sa-ack" ou the east, aud is about one-third as high. Here I was exhausted and stopped to rest my broken back. While hewailing my condition, Lamhert proffered farther help, and getting down on hands and toes showed how Andersou climhed such rocks. I began painfully creeping along, aided hy a few fissures now and then in the smooth rock, for the first 100 feet. From thence the proper and perilous climhing commenced. Each hand and foot had to be carefully placed among the loose, dissolving granite resting on a surface elevated at an angle of ahout 60°. Slowly and with frequent halts the ascent was made of the attendant dome. From its top a close view of the giant wonder is giveu. But I could not he satisfied with only a sight of Anderson's rope running like a dark line from pin to pin until lost to sight over the crown. Lamhert kindly assisted me down across the saddle of rock hetween, and joyfully I handled and examined the lower end of the long 900 feet line. It is made of baling rope, 5 to 11 strands in number, one being knotted around the rest once in 10 to 14 inches for convenience of staying the hands from slipping.

My regret at being placed *hors de combat* just that morning, of all the 10 weeks almost constant riding from Santa Barbara to and about Yosemite, now became agony. I gatbered souvenirs of flowers and prepared to return, when a voice hailed us from over the east dome, and a man came stalkiug down the slope with a sure and easy tread that told the strength of his limhs and the resolution of his heart. He proved to he Mr. E. W. Baker, a cool headed carpeuter from Alameda, accustomed to walking on dizzy heights. Hastily inquiring he learned my state, but declared I must go up witb him if he had to carry me on his hack. Taking from a busb near by the rope that Anderson used for the purpose, ahout 15 feet long, he tied one end about his waist aud I placed the other about mine.

Promising to let me down from any point if my strength failed me, he grasped the rope and ran up nimbly as a cat, hand over hand, and I slowly followed. Raising the rope out from the rock causes your pressure against it witb nailed boots to be increased in the ratio of your lifting power. So firmly your feet cling to the glassy rock, and clink, clink, the iron nails ring out upon the air, keeping time with tbe regular reaching of the hands up, up, up!

Occasionally, clefts, in the rock afforded footbold enough for a moment's rest and a survey of the glorious scenery unveiling below. The great Yosemite from Mt. Watkins to Eagle Rock yawned on our right. The scarcely less interesting Little Yosemite, began to sbow its further domes over the forest on the south; before us diminished the attendant dome, from whose top the voice of Lamhert came cheerily: "You are doiug well!" "Ahout half-way up!" Later came the shout, "Three-fourths of the way!" My back seems to be separating in tbe region of the lumbar vertebra and pains shoot through the part keen as knife-thrusts, but I keep on grasping the rope with trembling, weakened fingers. "Only three pins more!" I gasp and feel an inclination to halt, and turn around giddily. "Depend more upon the little rope," Baker calls down, in a firm voice." "I can pull you up bodily." "Almost up!" shouts Lambert from the far depths. "One more pin!" Baker creeps up to it, sits down above it, and pulls me up over the cape stone. The perilous climb is done; the crown of "Tis-sa-ack," is reached, over 10,000 feet, nearly two miles above tbe level world! Rest followed, while the hearts throbbed and the eye wandered. O, what a glorious vision lies out-spread, of gorge and dome, turret and pinnacle!

Warm, forest-clothed valleys clasp the bases of cold snow-mantled peaks. Rivers rush cascading down precipices, their sources locked behind moraines as blue miniaturc lakes, the pools at the foot of melting glaciers. The air is cool and still, and unflecked in all the azure expanse save a few white cumuli in the far east, riding like vast argosies dangerously near the pinnacles of Lyell. How sweetly, softly, falls the noontide sunlight upon the deep, almost bottomless Yosemite! Scarcely you realize the valley is tbere. The dew and humidity of the atmosphere heclouds all below, in contrast with the clear ether of the upper depths that seemingly brings distant peaks to be close at hand. To see peaks you must climb peaks. What appears towering aud majestic to the observers of the valleys, is dwarfed to mole hills or lost entirely. Mt. Star King ou the south, Sentinel dome at the west, a nameless dome across the valley to the north, and Cloud's Rest at the east, all roundcd summits, seem brother formations with "Tis-sa-ack." Lower, hundreds of domes, embossing the granite plateau, tell where the glacial seas of old did effective work in crushing mountain summits, leaving their hardened knobs as records of their elevation and power.

Exploring the top of the half dome, we found it a convex, elliptical table of rock, depressed several feet near its center hy a cross valley, and extending ahout 100 rods in a direction nearly northeast and southwest. The uorth wall, seemingly so smooth and clean cut from below, is really notched and mucb diversified. On its outer point, the visor of "Tis-sa-ack's" crown, stands a flagpole of fir ahout 15 feet long, and eight iuches in diameter at its hase, upheld hy piled rocks. Though seldom registering myself in the usual places, I thought it proper to pencil my name here with the thirty or forty only others that have ventured up this fearful steep. We let fall stones from the cliff aud timed their arrival at the incline facing Mirror lake, 11 to 13 seconds according to character of plummet, whether light slate or heavy granite.

Southwest of the flagstaff ahout 10 rods is a fissure cleft through the crown of the dome, ahout one foot wide, concealed for most of its way by a sliding cap, the upper concentric layer of rock that overlies this dome like all tbe rest. We dropped pebhles into the exposed end of this fissure at the southwest, and heard them descending for 13 seconds. Takeu into consideration with other lesions, and splittings notably on the Cap of Liberty and elsewhere, there may he some ground for the helief of the Indian relics here that the sides of the Yosemite are destined to fall in and destroy the white man.

Only one tree has taken root on the summit. This stands near the edge at the western side of the ellipse and is ahout two feet thick at hase and 25 feet high, with the peculiar, many-branched, depressed limhs of the *Pinos monticola* found on such highths.

The flora of the dome is either dwarfed specimens of lesser elevations or small alpine species. I gathered characteristic specimens as souvenirs, and find that a few dozen speeies would comprise the list; principal of these are several species of *Eriogonum*, *Spiræa*, *Hieracium* and *Ivesia*, with the dwarfed form of tbe golden-cup oak *(Quercus chrysolepis)* that so puzzles our American authority for forest trees, Dr. Engelmann, of St. Louis. This was called a distinct species by Dr. Kellogg, of Sau Francisco, but on the various slopes ahout Yosemite and elsewhere in the Sierra, I have found specimens grading all the way from tbe tiny prostrate hush loaded with small, smooth-cupped acorns, to the tall, majestic tree hearing yellow, golden, dust-covered acorn-cups two inches across; and I quite agree with Dr. E. that the speecies included all the forms.

The descent of "Tis-sa-ack," by the small rope swinging almost vertically over the side, was scarcely less fearful though taking less time, and was performed by hacking down. Often the foot failed to find a resting place and you dangled in air until reaching over and heneath the concentric layers your iron boot-nails caught upon the inner rock. And thus slowly you drop down from the pinnacled horizon of myriads of of snowy crests to the misty and shadowry depths of the pathless forest, from the brightness of heaven to the gloom of earth, from "Tis-sa-ack's" crown to "Tis-sa-ack's" foot.

Milling of Auriferous Veinstone.

The following is abstracted from a paper read hy Mr. Melville Attwood, before the California State Geological Society, at a special meeting held August 1st.

It is now generally admitted, that all the gold of our California lodes, excepting that combined with tellurium, exists in a metallic state. The stamped veinstone issuing from our mills is associated with gold in four different states: 1st, free gold capable of concentration with water; 2d, laminated gold, easily carried off with water; 3d, gold mechanically mixed and enclosed in the coarser particles of pyritic matter, found associated with gold-hearing quartz, which particles require more complete pulverizing in order to liberate the gold; 4th, telluric gold.

Of the three modes of reducing veinstone, namely, crushing, stamping and grinding—the first by horizontal rollers and rock-breakers, the second by stamps, and the third by edge mills, pans, arastras and millstones—that of stamping will be found to be the most rapid and economical, particularly when the veinstoue requires to be reduced fine; so that in those mills where they use pans, it is a great mistake to allow the pans to do the work of the stamps.

The California stamping mills are considered the best of any in the world, doing a larger amount of duty, with less wear and tear, than those made elsewhere; but they are costly, all the iron used in their construction having to be imported—a large proportion coming from Great Britain, aud paying a heavy duty. This might be greatly lessened if the resources of this country were brought into use and the iron made here. Steel iron, vastly superior, much cheaper, and more suitahle for tbe construction of our mills, might he made from our large deposits of rich iron ore. In different parts of this State there are large deposits of the richest kind of iron ore (magnetite), out of which could he manufactured, direct from the ore, by the Catalan process, shoes, dies, tappets and cams, at a cost considerably less than what is paid for ordinary castings made of imported foreign iron. The iron, or rather semi-steel, made from the magnetite with charcoal by the Catalan process, has been used in the Brazilian stamping mills from their commencement. Its cost, delivered at their mills, is about four and a half cents per pound. It has two of the best properties of iron, namely, hardness and toughness. The cams made from it could hardly he broken, and, when worn, could he easily refaced; the shoes and dies would last out three or four cast iron ones, and, as the surfaces wear more evenly, they would reduce the rock finer and quicker than those made of cast iron.

In 1867, at my request, some 50 shoes, made of the hest Bessemer steel, were sent to one of the large Brazilian mills, and after a fair trial, the Brazilian millmen, I was told, pronounced in favor of the native iron. In order to illustrate the methods of which he treated, Mr. Attwood presented a number of speeimens, the first of which was veinstone from the Sumner mine, Kern river. It contained sphalerite (zinc hlende) arsenicaland, iron pyrites, and some small specks of galena. Besides the gold with the quartz, a large proportion was, he said, mechanically mixed and disseminated throughout the associated sulphide, hut in extremely fine condition, the grains heing smaller and lighter than those of the alluvial gold of the sea heach, or even the re-wash of the old river terraces hy the sea.

Ore like this specimen must he reduced to a powder, so fine that 90% of it would pass through a sieve having 10,000 holes to the square inch.

The loss of gold on treatment of such veinstone hy either of the milling modes in use in California, would, if the gold contents did not average more than ten dollars to the ton of veinstone, he at least 25%, the loss on treatment heing always greater in proportion to the poorness of the rock.

If the veinstone was rich enough to hear the extra expense of dry stamping and amalgamation in *wooden barrels* (iron barrels were tried, hut the results obtained by them were not satisfactory), the same as used at San Joao del Rey mine, Brazil, the loss on treatment would be less than five per cent.

The San Joao del Rey veinstone, when prepared for stamping, contains about 45% of pyritic matter. It is a remarkable fact, that the smallest speck of gold is rarely seen, previous to concentration, in any of tbe veinstone from this mine. The loss in gold by amalgamation of the concentrated pyritic matter (sulphurets) in wooden barrels is less than one per cent.

[In subsequent issues the remainder of this very practical and interesting paper will he published.]

How to Locate a Mineral Lode.

The Nevada City *Herald* extracts the following from the instructions of the Commissioner of the General Land Office. If parties wishing to claim their mineral discoveries would pay strict attention to these directions, they would he saved much expense in the courts and a great deal of trouble generally.

The claimant sbould, prior to recording his claim, unless the vein can be traced upon the surface, sink a shaft, or run a tunnel or drift, to a sufficient depth therein, to discover and develop a mineral-hearing vein, lode or crevice; should dctermine, if possible, the general course of such vein in each direction from the point of discovery, by which direction he will be governed in making his boundaries on the surface, and should give the course and distance as nearly as practicable from the discovery shaft on the claim, to some permanent, well-known point or objects, such, for instance, as stone monuments, blazed trees, the confluence of streams, points of intersection of well-known gulches, ravines or roads, prominent buttes, hills, etc., which may he in the immediate vicinity, and which will serve to perpetuate and fix the locus of the claim and render it susceptible of identification from the description thereof given in the record of locations in the district.

In addition to the foregoing data, the claimant shonld state the names of adjoining claims, or if none adjoin, the relative positions of the nearest claims; should drive a post or erect a monument of stones at each corner of his surface ground, and at the point of discovery or discovery shaft should fix a post, stake, or board, upon which should be designated the name of the lode, the name or names of the locators, the number of feet claimed, and in record, in addition to the foregoing description, should state whether the entire claim of 1,500 feet is taken on one side of the point of discovery, or whether it is partly upon one aud partly upou the other side thereof, and in the latter case, how many feet are claimed upon each side of such discovery point.

Within a reasonable time, say 20 days after the location shall have beeu marked on the ground, notice thereof, accurately describing the claim in the manner aforesaid, should be filed for record with the proper Recorder of the district, who will thereupon issue the usual certificate of locatiou.

CHANGES.—The Klamath Quartz M. Co. has filed a notice of a change of its priucipal place of business from Siskiyou to this city. The capital will be increased from $300,000 to $10,000,000. The Tellurium G. & S. M. Co. has given notice of increase of capital stock from $210,000 to $2,500,000, and from 2,100 shares to 25,000.

Mechanical Progress.

The Old Time Millwrights.

An English writer nf a book on mechanical progress pays the following passiug tribute to the old millwrights, whoso distinctivo occupation like Othello's, has now well nigh gone. It was very truly remarked that tho millwright nf former days was to a great extent the sole representative of the mechanical art, aud was looked upon as the authority in all the applications of wind and water, uuder whatever conditions they were to be used, as a motive power for the purposes of manufacture. He was the engineer of the district in which he lived—a kind of jack-of-all-trades—who could with equal facility work at the latho, tho auvil, or the carpenter's bonch. In country districts far removed from towns he had to exercise all these professions, and he thus gained the character of an iugeuious, roving, rollicking blade, able to turn his baud to anything. Ho wandered from mill to mill iu search of work, aud was everywhere recoguized as nn itiuerant engineor and mechanic of bigh reputatiou. He could handle tho axe, the hammer, and tho plane with equal skill and precision. He could turn, boro, or forge with the oase and dispatch of one brought up to thoso trades, aud he could set out and cut in the furrows of a millstouo with an accuracy equal nr superior to that of the miller himself. These varinus duties ho was called upon to exercise, and seldom in vain, as in tbe practico of his profession he bad mainly to depend upou his own resources. Generally bo was a fair arithmetician, know something of geometry, levelling, and mensuration, aud in some cases possessed a very competent knowledge of practical mathematics. He could calculate the volocities, strength, and power of macbines, could draw in plan and scetion, and could construct buildings, conduits, and water-courses in all the forms and under all tbe conditions required in his professional practice. He could build bridges, cut canals, and perform a variety of work now done by civil engineers.

The introduction of the steam-engino, nnd the rapidity with which it created new trades, proved a heavy blow to the distinctive position of the millwright, hy bringing into the field a new class of competitors in the shape of turners, fitters, machine makers, and mechanical engineers; and, notwithstanding the immense extension of the demand for millwork, aud the great stimulus which it afforded to the manufacturos of the country, it nevertbeless lowered the position of tho millwrigbt, and levelled it in a great degree with tbat of the ordiuary mechanic.

Tire Fastenings.—A new and valuable method of fastening tires, invented by Mr. Kaselowsky, a German engineer, has successfully stood the test of a series of experiments. A dovetailed groove is turned in tbe innor face of the tire, and a similar one iu the outside of tbe skeleton, so that, when the tire is slipped on, the two come opposite to each other and form a channel of dowel-shaped section going all round the wheel. Into this chanuel is run some easily-fusible metal (hy preference pure zinc), wbich, on cooling, makes a firm connection between the tire and wheel. In carrying out tbe operation the tire is only slightly heated, a sbrinkage of 1-1200 being found ample, and is then brought over the skeleton, wbicb is laid in a horizontal position, and forced upon it. The zinc is tben immediately run in througb holes cast in tbe skeleton, if of cast metal, or drilled in other cases; thus the zinc is at once prevented from cooling wbile being run in, and is compressed, and thus rendered much stronger by tbe subsequent contraction of the tire. That this mode of fastening, in addition to its simplicity and cheapness, offers full security, both against sideways shiftings and in case of breakage of the tire, has been proved by experiments made in the central workshops at Frankfort.

American Threshing Machines at Paris.—The American thresbing machines on exhibition at Paris are splendid specimens of workmanship, and they fairly astonish the elegant Parisians. The *Echo Agricole*, of Paris, speaks of them in the following complimentary terms: To see these tbreshing machines, constructed with perfect taste as to sbape, and with richness in tbe materials employed, true specimens of cabinet work and inlaying; these reapers and mowers, where all the metallic portions shine likc silver, one does not imagine himself in the midst of apparatus destined for work which is reputed vulgar, such as cutting the wheat or mowing the grass, hut in a store of enormous jewelry and among true works of art. Never, in any country, have been seen snch grace aud splendor. If by the magnificence of the machine we are to judge of the character of the workman, who would not be inclined to suppose the American farmer to be equally fine, walking the earth, not in blouse and wooden shoes, as with us, hut in full dress and with hands gloved?

A Car for Liquids.—There is shown at Paris a tank car for alcohol, wine, etc. It bas a cylindrical horizontal tank, with suitable connections, and a rotary pump serving to charge tbe tank, or, by reversing, to empty it.

The Manufacture of Cast Steel.

Hitherto cast-steel has been produced by the fusion of converted steel in pots or crucibles with or without the admixture of other ingredients; but, according to the *London Mining Journal*, Mr. W. H. Nevill, nf Ferryside, Carmarthon, has discovered that by reversing the usual order in which the processes of conversion and fusion are carried on—that is, by recarbonizing fused metal—he obtains a high quality of steel at a considerably reduced cost. In carrying his invention into effect he takes metal that has been made hy the ordinary Siemens or Bessemor processes, aud after tho necessary forging and rolling, or either of these separately, and after having brougbt the metal into the required size and form, he submits it to a recarbonizing process in closed vessels, or as nearly so as he is able to obtain them. Theso vessels may be nf cast or wrought iron, or fire-clay, nr nther material capable nf resisting the requisite heat, and the carbonizing materials may bo ordinary substances used in the cementing process as nt present carried on. He prefers, however, to carry on the operation in wrought iron vessels, about five-eighths or three-fourths of an inch thick, and of such a form as will best suit the purpose for which the steel is intended. He has used them from three to five feet in length, and from six to ten inches square, but he does not confine himself to these dimensions. The covers are made to project beyond the sides of the box, so as to admit of their being firmly fixed with keys, or wedges, or other suitable means, and the interstices afterwards filled with wet clay or other suitable material, rammed in tightly. The process may be carried on in an ordinary reverberatory or gas furnace, aud will require such a time and degree of beat as the purpose for which the steel is wanted may render necessary.

Compressed Fuel at the Exposition.

Foreign roports bring items concerning the progress in the manufacture of compressed fuel, as sbown by the exbibits at tbe Paris Exposition. A very powerful and apparently effective macbine for making "briquettes," or blocks of compressed fuel dust, is shown by tho Foyers et Chantiers de la Mediterranee, of Havre. Tbis apparatus is double, there being two vertical steam cylinders, whose pistons produce a pressure in a hydraulic cylinder below. This pressure is communicated to two otber hydraulic cylinders, one under one side of each of two horizontal intermittently rotating mold tables, in the line of the molds. The molds are filled from a mixer-hopper between the steam-cylinders, and pass under a strong iron plate over the side bydraulic cylinders, receiving upward hydraulic pressure. Tbe steam cylinders are single acting, the piston being witbdrawn by very small vertical cyliuders, placed above the main cylinders. Each rotating table bears 12 molds of a size sufficient to make a five-kilogram block. The pressure given is 300 kilograms per square centimeter. Tbe capacity of the machine is 320,000 kilograms in 24 hours.

The Societe Generale de Chauffage, Paris, shows some square flat briquettes, each pierced witb four holes to facilitate burning, aud state that the machine making them makes 24 briquettes at each stroke of tbe piston, making five strokes per minute, corresponding to 120 per minute, or 7,200 per bour, rather a bigh claim for a machine stated to consume but four-borse power.

Large Belts.—We read that, at the Paris Exposition, some fine main driving helts, made after Sampson's patent, are shown hy Mr. Edwards, of Manchester, England. There is one double helt, 207 feet long, 63 inches wide, which weighs 2,962 lbs., and is made to transmit 600 indicated horse-power. Another is 184 feet long, 53 inches wide, whilst a third is 163 feet long, and 63 inches wide. These two latter weigh together 4,378 lbs., are without cross-joints from end to end, and are intended for a large cotton mill, to drive direct a flywheel 30 feet in diameter, and 10 feet 3 inches on the face. The combined horse-power they are made to transmit is 1,000.

A Painting Machine.—An English firm shows at tbe Paris Exposition a novelty in the form of "Roberts' self-acting painting machine," which will paint or varnish, without steam power, the window-blind latbs of the figures given being 60,000 running feet per hour. The flywheel spindle of tbis machine carries a pair of bucket grooved wbeels, which in their rotation dip into a well or reservoir of the paint or varnish to be used, and then discharge the pigment on the lath inserted between small rollers. Equality of distribution is provided for hy means of stationary brushes. Hoop iron intended for packing purposes, or bedsteads, can he treated in the same manner.

A Steam Tricycle.—In one of the railway material annexes at Paris is a steam tricycle, having the boiler under tbe rider's seat, tbe hind wheels being driven by a cord from tbe crauk-shaft pulley. The engine is a tiny cylinder, inclined about 45°. The position of the boilcr, which, by the way, is of a ratber complicated and inexplicable type, commends itself for winter use.

Scientific Progress.

Ants and the Larvæ of Lycæna Pseudargiolus.

The behavior of ants toward aphides, from which they obtain supplies of a secretiou which is quite to their tasto, has long been a matter of observation. It is now announced tbat ants have a way of cherishing the larvæ of the butterfly *(Lycæna Pseudargiolus)* for tbe tasteful matters which it oxudes. In tbe last issue of the *Canadian Entomologist* there is a description of nbservations of this kiud by W. H. Edwards, of Virginia, from which we quote as follows: "The ants, when discovered on n stem, will invariably be on or near the larvæ. They run over the body, caressing with antennæ, plainly with the object of persuading the larvæ to emit a drop of the fluid on the eleventh segment. Most of this caressiug is doue about the anterior segments, and while the ants are so employed, or rather while they are absent from the last segments, the tubes of the twelfth segment are almost certainly expanded to full extent, and so remain, witb no retracting or throbbing, until the ants come tumbling along in great excitement, and put either foot or antennæ directly on or close by tho tubes, wben tbese are instantly withdrawn. Tho ants pay no heed to tbe tubes, do not put their mouths to them or to the openings from which tbey spring, nor do they manipulnte that segment. They seek for nothing and expect notbing from it. But they do at onco turn to the eleventh, caress the back of the segment, put their moutbs to the opening and exhibit an eager desire and expectancy. By holding the glass steady on the eleventh, a movement of the back of this segment will soon he apparent, and suddenly there protrudes a dull green, fleshy, mamilloid organ, from tbe top of which comes a tiny drop of clear green fluid. This the ants drink greedily, two or tbree of them perhaps standing about it, and tbey lick off tbe last trace of it, stroking the segment meantime. As the drop disappears this organ sinks in at the apex and is so withdrawn. The ants then run about, some seeking otber larvæ on tbe same stem, some with no definite object, but presently all return and the caressings go on as before. The intervals between the appearance of the globule varied with the condition of the larvæ. If exhausted by the long continued solicitings, some minutes would elapse, and the tubes meanwhile remained concealed; but a fresh larvæ required little or no urging, and one globule followed another rapidly, sometimes even without a retracting of the organ. I have counted six emissions in 75 seconds. Tbe larvæ did not always await the approach to the eleventh segment, but gave out the drop unsought and as soon as it was aware of the presence of tbe ant. Now and then the drop was preceded by a bubble several times larger than itself."

The Formation of Quartz.—A San Francisco engineer and metallurgist, J. Mosheimer, writes to the London *Mining Journal* as follows: A further proof of tbe formation of quartz from aqueous solutions has presented itself in a steam boiler in use in one of the Nevada mines. A boiler of four feet in diameter and provided with five flues, had been in use for some years, but little attention had been paid to cleaning it, or hlowing it off, as it is called, and a sediment accumulated until it reacbed the first two flues. The whole of the interior was heavily incrustated, and as it conducted too little heat tbe boiler had to he replaced by a new one. After cutting the former to pieces my informant, Mr. E. Watkins, M. E., found a heavy incrustation all around the inside. At the bottom of the boiler a soft sediment was found, which was overlaid by anotber hard crust. The flues were incrusted on top with silicato of lime, and had at the bottom a coating of solid transparent crystals of quartz; tbe crystals were of rhomhoidal shape, about one-half incb in length, and as perfect as any other natural quartz crystals. Tbe formation of quartz crystals of considerable size in boiling water in but a few years leads me to the belief tbat the large quantities of granulated quartz which were found in early days in the burning Moscow mine, on the Comstock lode, were of tbe same origin. As quartz can be decomposed and made soluble hy the action of steam in combination with an alkali, and then used as soluble silicate, it establishes in itself the theory of its formation from aqueous solutions.

In St. Gothard.—A singular depression has been lately noticed in the strata which are traversed by tbe St. Gothard Tunnel. Some geologists think tbat it indicates a subterranean sea in the interior of the mountain. A late report of the inspector of tbe works asserts tbat the irregularity has ceased, and tbe perforation bas resumed its regular course. On the southern side there is an advance of three metres per day. It is a little less at tbe northern extremity, where the tunnel has not yet emerged from the serpentine, although it has traversed tbat hard rock for double the distance that the geologists anticipated.

The Realm of Mathematics.

The opening address of tbe last meeting of the British Association for the Advaucement of Science was delivered hy Mr. W. Spottiswoode, and his theme was the science of mathematics. The following are his concluding remarks:

Conterminous with space and coeval with time is the kingdom nf mathematics; within this range her dominion is supreme; otherwise than according to her order nothing can exist; in contradiction to ber laws notbing takes place. On ber mysterious scroll is to be found written for those who can read it that which bas been, that which is, and that whicb is to come. Everything material which is tbe subject of knowledge has number, order, or position; and these are her first outlines for a sketch of the universe. If our more feeble hands cannot follow out the details, still her part bas been drawn with an unerring pen, and her work cannot be gainsaid. So wide is the range of mathomatical science, so indefinitely may it extend beyond our actual powers of manipulation, tbat at some moments we are inclined to fall down with even more than reverence before her majestic presence. But so strictly limited are all ber promises and powers, about so much that we might wisb to know does she offer no information whatever, tbat at nther moments we are fain to call ber results but a vain thing, and to reject them as a stone when we had asked for bread. If one aspect of the subject encourages our bopes, so does the other tend to chasten our desires; and be is perbaps the wisest, and in the long run the happiest among bis fellows, who has learnt not only this science, but also the larger lesson which it indirectly teacbes, namely, to temper our aspirations to that which is possible, to moderate our desires to that which is attainable, to restrict our hopes to that of wb'ch accomplisbment, if not immediately practicable, is at least distinctly within the range of conception. That which is at present beyond our ken, may, at some period and in some manner as yet unknown to us, fall within our grasp; but onr science teaches us, while ever yearning with Goetbe for "Light, more light," to concentrate our attention upon that of which our powers are capahle, and contentedly to leave for future experience the solution of problems to which we can at present say neither yea or nay.

In proportion as method is better than impulse, deliberate purpose than erratic action, the clear glow of sunshine than irregular reflection, and definite utterances tban an uncertain sound; in proportion as knowledge is hetter than surmise, proof than opinion; in that proportiou will the matbematician value a discrimination between tbe certain and tbe nncertain, and a just estimate of the issues whicb depend upon one motive power or the otber. While on the other hand he accords to his neighbors full liberty to regard the nnknown in whatever way they are led by the noblest powers that they possess; so on the otber he claims an equal right to draw a clear line of demarcation between that which is a matter of knowledge, and tbat whicb is at all events something else, and to treat the one category as fairly claiming our assent, the other as open to furtber evidence. And yet, wben be sees around him tbose whose aspirations are so fair, wbose impulses so strong, whose receptive faculties so sensitive, as to give objective reality to what is often but a reflex from themselves, or a projected image of their own experience, he will be willing to admit that there are influences which be cannot as yet either fatbom or measure, hut wbose operation be must recognize among the facts of our existence.

The Character of Recent Arctic Researches.—It seems that the Englisb are coming to doubt whetber, after all, the Arctic researches are wortb wbat tbey cost. At tbe last meeting of the British Association for the Advancement of Science, Sir C. W. Thomson read a paper in which be rejoiced in the scientific character of all recent explorations, and alluded to the question of a Polar sea, tbe search for which he considered hardly worth tbe cost. It should be carried out, if at all, by permanent stations on tbe principle recommended by Lieutenant Weyprecbt, or hy pushing forward during the Arctic winter, establighing refuge huts at enormous expense. He spoke of the one ocean flowing northwards, of which the other water spaces were but gulfs, and in the abyssal depths sounded by the *Challenger* expedition there were found sharks' teeth of an extinct species. It appears, he said, now to be a generally received opinion among geologists tbat "massive" eruptions wbich originated tbe mountain chains which form tbe skeleton of our present continents and the depressions occupied hy our present seas date from the secular cooling and contraction of the crust of the earth from a period much more remote than the deposition of the earliest of the fossiliferous rocks. If this view be correct, it is quite possihle that until comparatively recent times no part of tbe ocean was sufficiently deep for tbe formation of a characteristic abyssal deposit. He proceeded to refer further to the Antarctic icebergs, accounting for tbeir uniform hight, and considered tbe Antarctic low-lying continent bordered by an ice cliff 230 feet in hight, the top universally covered witb a layer of the whitest snow, the upper part of the cliff being pale blue, deepening at the base.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

AMADOR.

KEYSTONE.—*Ledger*, Sept. 7: No sinking has been done on this mine for three years, nor will any he necessary for at least two years to come. Forty stamps crush 100 tons per day, yet little impression is mads on the vein. The yield of the last run was hatter than for eight or nine months past. The lowest level is 815 feet from the surface.

ITEMS.—The Gover ore, for some months past poor, is now of a superior character. What appears to he a large hody of quartz has been discovered outside the boundaries of the Ksnnsdy mine. Sinking progresses at ths Oneida mine. At the Moore mine the whols ledge is in paying ore, some of the quartz assays as high as $120, and enough rock is in sight to occupy a 10-stamp mill for a year. Ths Talisman is crushing Tucker Hill, Sutter Creek, ore. Noticsahle activity is reported at the Ione Coal Co.'s Carhondale mine. The quartz mills and mines using Amador Canal Co. water are in full running order.

CALAVERAS.

BONANZA.—*Chronicle*, Sept. 7: Moser & Co., proprietors of the Big Bonanza hydraulic on Tunnel Ridge, have cleaned up and closed their season. The mine paid well to the last. Less than two months netted over $2,000.

ITEMS.—Veith, of the Mammoth, Tunnel Ridge, has cleaned up and suspended. His season has been good. J. J. Holmes, of the San Joaquin mine, Mosquito, has at last cut the ledge, and is mining rich ore. A new 20-stamp mill is in prospect for the Wallace & Ferguson mine, at Sheep Ranch. Garland's mill is at work on quartz from John the Butcher mine. At Haskins & Hadler's Champion mine, West Point, work is active. Carlton's mill is at work on the ore. Porteous & Co. are husily working their mill on their Bummerville ore. The Banncr mine, at Mosquito Gulch, is freed from water, and sinking has commenced. Some Beardsley ore, worked at Harris' mill, paid $100 per ton. A tunnel to tap the ledge at a greater depth is being run. After considerable expenditure of capital and patience, Mr. Chavanne has struck good ore in his mine at Sheep Ranch. Hoey & Sliter gravel will average $1 per carload.

FRESNO.

SILVER.—*Expositor*, Sept. 5: W. P. Litten brought into this office a number of fine looking specimens of silver ore, taken from a depth of 50 feet in the Fresno G. & S. M. Co.'s mine in the Oro Fino district. The rock is very rich in silver, and the prospects are that the mine will be as rich in silver as it has been in gold. Gen. La Grange, former Superintendent of the U. S. Mint was present when the strike was made, and he pronounced the prospect a superior one, equal to the best ore from the Comstock. The metal-hearing quartz veins of this county all seem to carry silver, and as depth is obtained the silver predominates. The find in the Oro Fino mines seems to prove that the quartz veins of Fresno county are really silver lodes, and, as we stated last week, a continuation of the silver lodes of Inyo and Mono counties. The existence of gold in the surface rock is no drawback to this theory, as it is well known that the Comstock mines were originally worked for gold, and that the ores from the leading mines are very rich in gold.

INYO.

LAKE DISTRICT.—*Independent*, Aug. 31st: Paul Bennett reports about 200 people located in the district and the outlook for the locality generally most encouraging. The Alpha tunnel, at the distance of over 225 feet, is fairly into the ledge. From the face of the tunnel heading Mr. Bennett broke a piece of ore which he brought to Mr. Curt. Ober, at Big Pine, for assay. The result of two assays gave the highly flattering yield of $259.10, of which $25.11 was in gold. Mr. Bennett considers this, at near as may be, a fair average for the full face of the ore streak, which is no less than five feet in width. The mammoth mill will hs ready for operations some time in October. The Mammoth ledge is said to be very large, but of ore of a grade so low as to raise a question as to successful running of the mine.

INSPECTION.—A San Francisco party consisting of John Neate, President, and Fred Homer, one of the Directors of the Independence M. Co., accompanied by Captain H. Williams, will thoroughly examiue the mines of Kearsage. They may go back so far as Cerro Gordo and take a look at properties there and then go northward, taking in Benton, Lake and Bodie.

SILVER SPROUT.—The Rex Montis company have a force at work upon the old Silver Sprout mine. Quite a quantity of good ore is now on the dump, besides some five or six tons that have been packed down to the mill.

MARIPOSA.

MARTIN AND WALLING.—*Gazette*, Sept. 7: Douglass and Stevenson have purchased this mine, and have done considerable work at pumping, running levels and taking out ore. They have struck two good paying chutes. A mill is in contemplation. This mine was once a flourishing one and good management will revive it.

HASLOE MINE.—This is the old Samuel Funk mine. Since the death of its discoverer, whose name it bors, the mins has passed through several hands. Under the management of the Hasloe company, it did not succeed, hut the suspension of this company was not, it is thought, any fault of the mine itself. Capt. 1. Beck and Wm. Ncil, said to he experienced miners, have now honded the property for a year, and the old miue is to have a fair trial.

SCANLAN MINE.—Mr. Thomas is still expecting an ore chute. Thc improvements at this mine consist of a 10-stamp mill, run hy water power; the water lasts during eight months of the year, and is utilized hy a new turbine wheel; there are also three improved concentrators, pan and settler, and two improved ore feeders, all of which are new and in complete order.

MONO.

BODIE DISTRICT.—*Standard*, Sept. 4: Taks the whole mineral helt, from the Blackhawk on the north to the Sigourney on the south, and work is being advanced as never before since ths camp was struck. The vein in the Blackhawk is much wider and considerahly improved in quality. The new hoisting works for the Summit, Bodie and Champion mines are now on the ground, and those ordered for the Richer, South Bulwer, Old Dan, May Belle and Concordia will reach here in a few days. The hoisting works for the Champion are completed and have heen in first-class runuing order for the past week, and the shaft will now he driven down as rapidly as possible. The South Bulwer, recently incorporated, is showing up a very pretty two and one-half foot ledge, which is improving in quality, and from its location, heing south of the Bulwer and Belvidere, and only a short distance from the Bodie, makes it a valuable claim. It is thought that another ledge will soon be cut in the bottom of the shaft, as the formation is of the most favorable kind. J. M. Dawley and John C. Turner paid for this mine $20,000 in cash, hesides considerable stock, and in one hour after the purchase, $40,000 could not have hought the mine.

BODIE MINE.—Good progress is being made in sinking the new shaft, now down 50 feet; also the sinking of the Brice and Burgess winzes, the former of which is in very high-grade ore. The mill still turns out an immense amount of bullion. From July 31st to August 31st the 1,050 tons of ore crushed yielded $601,-103.87.

STANDARD.—The slowly sinking shaft is now 672 feet deep. No increase of water. North drift of 300 level now in 393 feet and steadily advancing. Ledge three feet wide and of good ore. The same is true of the ledge in the 450 level, south drift, upraise.

SIGOURNEY.—The main tunnel is in 142 feet. The ledge in the face is three and one-half feet wide, and of excellent ore. The north drift, in about 20 feet, shows a good ledge all the way. The south drift, 16 feet, also follows the ledge. Two shifts are at work and good progress is made.

RED CLOUD CON.—Work has progressed in both the north and south drifts, with marked improvement in the latter. The east crosscut is also being pushed forward.

OLD DAN.—Superintendent Singletary has commenced a new shaft on this mine, and will push it down as rapidly as circumstances will admit.

NORTH AMERICA.—Before crosscutting, the shaft will go 50 feet. At 25 feet a two-foot ledge was struck.

MARY ANN.—The shaft is down 35 feet. The ledge, though not very large, assays well, and promises to widen.

OTHER MINES.—Less than three days' work on the Muldoon has already developed strata of rotten quartz. On September the 4th, the ground was broken for the Mono shaft. Geo. Daly is Superintendent. Work commenced on the Mountain Belle September 2d. The Golden Star shaft at a depth of only 14 feet uncovered an eight-inch ledge. The shaft is down 30 fect on Horace Pullen's South Pacific. The Charter Oak shaft is down 18 feet. In the Hibernia shaft, down 15 feet, a good ledge formation has been struck. The True Business shaft, down 53 feet, has an 18-inch ledge. At 20 feet a small ledge is appeariog in the Enterprise shaft. The Apollo shaft, 23 feet, has a 10-inch ledge. The Acme shaft is down 40 feet. The Wide-awake, Richmond and Chieftain have been bonded to San Francisco parties.

SOUTH END.—Herctofore there has been so little work done that it was really impossible to say whether the claims would improve on attaining depth, but the bottom of the Richer shaft shows conclusively that the further they are sunk the larger and better the ore. Quite a number of mines have recently been bonded on Queen Bee Hill and a little further beyond; among them the Enright Nos. 1 and 2, Gold Fish, and others. These claims have all been sufficiently prospected to prove that the ledges will yield good paying ore, and ere long there will he several mills erected in the canyon.

NEVADA.

CANADA HILL.—*Transcript*, Aug. 9th: The claim owned hy W. H. Martin, S. Harper and John Richards, is thought to be very valuable. The company have a ditch a mile in length and a good water privilege from Little Deer creek. The average depth of the gravel is about eight feet, and in places it is from 10 to 12 feet. This is believed, and with good reason too, to be on the far-famed Blue channel, running through Nevada, Sierra and Plumas counties. During the summer the owners busy themselves prospecting their quartz ledge. Thus far the rock extracted has yielded, on the average, $6 and sometimes as high as $7 per ton. The nsw tunnel is now in 70 feet, and within a foot or so of one of the old tunnels, from the other side of the hill, where in times past the ore has paid from $15 to $30 a ton.

ITEMS.—Messrs. Campbell, Chadwick, Storey and Beck, owners of the Sailor Flat at Blus Tent, have purchased an adjoining property, which they are preparing to work. Hopeful news comes of the Murchie. Superintendent Nickels, of the Planet mine, near Lowell hill, thinks that the tunnel, now in 1,260 feet, will soon reach the gravel channel. Conlan's mine, on Oshorn hill, is thought to he a good property by its owner, who works quietly at it. The final Centennial clean-up, of 94 loads, amounted to $9,096. Cowger & Co.'s mine is the only one in operation at Snow Point. Nine men have worked for a while on a small portion of it. Their clean-up at the end of August netted $3,400 out of $5,700. The American mine has struck very rich gravel. The Stone Ridge mining company are nearly ready to commence. Three tons of New York Hill sulphurets, workcd by Edmond & Co., yielded $1,070. The Alaska has a good ledge, varying in width from eight inches to two fest. The last month averaged $15 per ton. McDonald & Ford ore, 20 loads, crushed at Allison Ranch mill, may average $120 per load. Jones & Sons continue to extract the peculiar Black Lead ore. E. F. Morse & Co., leasing the Ben Frauklin, expect a ledge in a few weeks. John Ford and others, leasing the Judd & Casey, are taking out fine quartz, showing gold and galena. The Lafayette has on the dump six loads of quartz, appraised at about $64 per load. The Idaho mine yielded during August $50,000. It has paid its 109th dividend.

PLACER.

DAMASCUS.—*Herald*, Sept. 7: The Boh Lewis claim is owned by Robt. Lewis, O. Griffith and Fagan & Thomas. Their channel is rich, but the gravel is so firmly cemented that it is impossible to save the gold by the ordinary washing process. A 10-stamp mill which they put up some years ago cannot be used economically, so the old process must be adhered to. After the gravel has heen washed three or four times, its tailings yield to parties helow this claim, $5 to $6 per day to the man. The main tunnel is now in some 900 feet. The formation has remained pretty much the same since the tunuel passed the grass roots, where gold was first found.

MOUNTAIN GATE.—This claim, now in thousands of feet, has never ceased to pay. The company works about 30 men. Preparations are heing made to run the cars with mules. The gravel in the main channel is entirely of quartz formation, like Hidden Treasure gravel. Lately, however, a small but very rich blue gravel lead has been struck, which, it is hoped, indicates the proximity of a vast hlue channel running through the ridge.

GIANT GAP.—This claim is located on the North Fork side of the ridge, a few miles above Iowa hill. The company, composed mostly of Eastern capitalists, have put up heavy machinery and are running an incline into the ridge hetween Indian canyon and the North Fork, with the view of tapping the main channel.

DANETOWN.—J. C. Croshy, on the Thirty-One ledge, has sunk a shaft and put up hoisting works and engine. The ledge is good and is easily worked. A quartz mill near by is working on the ore, but the results of no clean-up are at hand. Chase & Cartwright, a few hundred feet north of Crosby, are sinking for gravel.

KELSEY.—Work on the Gold Deposit progresses rapidly. Work on the extension will soon commence. A tunnel has been run 80 feet parallel to the lode. Cutting to the ore is now proposed. Bell, east of the Lyonsdale mill, and Miller, on the General Grant, are said to he getting good prospects. The Estrella mine will soon commence working. Lack of capital has prevented the more rapid development of this mine. Until machinery was needed the mine did well.

SIERRA.

ORIENTAL.—A rich pocket has just been struck. Septemher 3d the strike was reported. September 5th the assays gave over $6,000 per ton. Some years ago a pocket in this mine yielded the owners over $40,000.

ITEMS.—Dave Stewart has had another assay of rock taken from the prospect hole near the Downieville slaughter house. The sample gave $229 gold and a trace of silver; another $3,100 gold and $1,400 silver. The Phenix quartz mine, near Sierra City, has been honded to Eastern capitalists, *i. e.*, the Downieville *Messenger* has authority for such announcement. At the Pliocene an excavation is being made in the walls at the hottom to stop the water. From this tank the water will he pumped to the surface, a distance of 170 feet. Water has suspended work on the Savage.

SISKIYOU.

THE COAL MINE.—Yreka *Union*, Aug. 31: Richardson's coal has been tested in the foundry of Lawton & Skinner. The results were not quite satisfactory, hut the foundrymen think with proper mauagement the coal can he used for their purposes. As Richardson and his four men proceed on the ledge it improves in quantity and quality. It is thought tobe very similar to Seattle coal. Some quantity will be taken out and tried for domestic purposes this winter.

PACIFIC LEDGE.—The quartz ledge which was found in the bedrock in the drift of the Pacific M. Co. has been traced on each side of the river, and located hy the company. Assay of a weather-heaten piecs gave traces only of gold. The company is now drifting with a view to hreasting out. They have sent a ton to the Cornish & Co. mill. The gold taken out is getting coarser, an indication, it is thought, that the Humhug channel is near.

LONG GULCH.—Hughes, Brown & Co. realized from 26 days' work on Long gulch, near Hawkinsville, 9½ ounces and one dollar. The claim was opened this spring. It is worked by drifting. The dirt is accumulated by wheelbarrows until sufficient is piled to make a washing.

ITEMS.—The Lucky Baldwin is started again. Pumping progresses. The company will sink a shaft to hedrock. The Empire mill runs well. The water used is from the Klamath. This admits of coutinuous work the year round. At Oak Bar, F. Khols & Co. expect soon to reach. pay. The Portuguese company ran through pay and did not realize well. The Lawlor & Mott claim pays well. Kittlswood & Co. are among the expectant; no pay yet.

TRINITY.

COFFEE CREEK.—*Journal*, Sept. 7th: The Nash D. G. M. Co. has located some valuable mining land near the head of Coffee Creek, in the vicinity of Union Lake, and have done considerahle work towards its development. At the present nothing is being done in their mines, owing to a protest having been filed in the Land Office in Shasta to their applicatiou for a patent. When this is decided the company will resume operations.

Mr. T. H. Blythe, of San Francisco, has eight men at work on his Coffee Creek ditch, who have been at it since the 15th of May. Should prospects warrant it, it is probable Mr. Blythe will crowd his ditcb to completion another season.

E. R. Smith & Co., on Morrison Gulch, and Pete Tinkham & Co., near the mouth of the creek, have done well this season. John Dack & Co. are at work on the East Fork of Coffee Creek, with encouraging prospects.

ALTOONA.—The Altoona Quartz mining company is making money and has good prospects. They employ about 30 men. The yield last month was 336 flasks.

ITEMS.—Shipments of gold dust from this county have been larger the past two months than ever before known. The Bullychoop and Occidental company have plenty of ore in sight of good grade. They are running one arastra, of which Tom Baker has charge. P. P. Black & Co., on Canyon creek, lately made a satisfactory clean-up.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, Sept. 11: The 600 east drift from main south drift on 1700 level progresses rapidly. Bottom in easily worked porphyry. Main south incline bottom during first part of week skimming over quartz and cutting occasional spots of ore. September 10th course of ore vein changed so as to cover size of incline, ore assaying as high as $300 to $800. The incline is four feet from the 2200 level. At the junction a working station will be opened and the width of the ore vein determined. At present it looks as if the entire size of the incline will he in ore by the time the 2200 level is reached. Enlarging shaft for douhle track progresses. The new machinery works well. The air upraise to the 1500 level makes good progress.

CALIFORNIA.—Yield for past week over 200 tons. The 1750 stopes yield good ore. On 1650 level the sill floor north from crosscut 4 in good ore. The face of the main north drift on same level in good ore. Winze started to prospect the vein helow the 1750 level. The south drift from the 1900 station of the Ophir winze to connect with the 2050 station of the C. & C. shaft progresses. The C. & C. shaft is 28 feet helow the 2050 station. The Con. shaft repairs make good headway. The heat in the lower levels is great. The water in the C. & C. shaft is strong.

OPHIR.—Progress good everywhere. A north drift from the 2000 level will soon start to open up new and promising ground.

NORTH CON. VIRGINIA.—A new drift started from the Union Con. will soon improve the ventilation of this mine and that of the Uniou Con., Mexican and North Ophir.

JULIA CON.—Assays light but prospects good. The main south drift on 2000 level is entering what appears to he a fine quartz vein, giving traces of gold and silver.

VARIOUS MINES.—Indications of a rich ore hody in the Con. Dorado. Good ore is coming from the Solid Silver. No change in the Yellow Jacket. Water in the Lady Bryan is rapidly receding. Vein and quartz matter in two drifts of the Caledonia. Vein streaks in north and south drift of the 1100 level in New York. The two east crosscuts of the 2360 level in Crown Point advance towards the ledge. Work progressing steadily in the Gould & Curry on No. 4, 1900, and in repairing main incline. Everything is in good order above and below in the Utah. Work on the main Sutro tunnel has heen temporarily stopped, while the Julia and Ward conuection is worked. A large ore body will soon he laid bare in 750, Leviathan. The appearances in the Vermont Con. are that the main vein is not very remote.

BULLION.—The west crosscut on the 2,000 level is steadily advancing, the face in vein matter of a soft character. A little water is coming in. The east crosscut on the 1,700 level is being pushed vigorously forward, the face in hard vein porphyry.

CON. VIRGINIA.—Daily yield of ore, 200 tons. There is no change in the ore producing sections of the mine.

SUCCOR.—The northwest drift on the 1050 level is steadily advancing, the face still in vein matter of the finest possible character, showing occasional bunches and streaks of good ore.

LADY WASH. CON.—The north prospecting drift on the 1300 level is still being pushed. Preparations are being made for prospecting the deeper levels by means of prospecting drifts from the lower levels of the Alta.

CON. IMPERIAL.—The face of crosscut No. 4 on the 2400 level is to-day in a splendid character of quartz carrying some ore.

WARD.—It is the intention to push the shaft downward until a connection is completed with the south drift on the 1800 level of the Julia shaft.

MORNING STAR.—It will not take long now to reach the point where the first vein of good ore was struck in running the tunnel.

ORIGINAL KEYSTONE.—Sinking the main shaft is making the best of progress. The prospecting drift from the north shaft is being pushed steadily forward to prospect the ore vein.

HALE & NORCROSS.—Monday last the pumps were again started. The water stands to-day, in the main incline, 65 feet below the 2000 level.

MEXICAN.—Sinking the joint winze below the 1600 level on the Union Con. south line is making good progress, the bottom in good blasting ground.

SAVAGE.—The pumps are again running and are rapidly lowering the water. It is now down 65 feet below the 2000 level. Work on the 2000 level has been greatly retarded during the week by the rising of the water. The face of the east crosscut on the 2000 level, 400 feet south of the Gould & Curry line, is still in vein matter.

SILVER HILL.—Not much was done at this mine during the past week except to overhaul the old and put in some new machinery.

TROJAN.—The north drift on the second station level is now in a distance of 147 feet, the face still in a fine character of quartz. The south drift from the fourth station is in 460 feet, the face in good quartz carrying some ore, spots of which are very rich.

UNION CON.—Sinking the joint winze on the south boundary line below the 1600 level is making the best of progress, the bottom in hard blasting rock. A drift northeast has been started from the main north drift on the 1600 level, which is designed to connect with the North Con. Virginia shaft.

BEST & BELCHER.—The east drift on the 1900 level is steadily advancing, the face in good vein matter carrying streaks of good quartz which afford low assays. Work has been resumed in the south drift from the bottom of the winze.

CHOLLAR-COMBINATION SHAFT.—The repairs to the broken machinery are all completed and everything again in the best of running order. The water has been drained sufficiently to permit of a resumption of work at all points in the shaft.

OVERMAN.—The south drift on the 1600 level from the bottom of the winze is progressing at the rate of 4½ feet per day, the face in very favorable vein matter.

ALTA.—Opening up the 1550 level is being pushed vigorously. The prospecting drifts on the 1450, 1850 and 1350 levels are all being pushed vigorously, so as to put those levels in the best condition possible for the rapid extraction of ore.

BELCHER.—The crosscut from the bottom of the 1900 winze is in twenty-nine feet, the face in fine looking quartz which has the appearance of making ore. Crosscut No. 1 on the 2360 level has penetrated into the vein five or six feet, the quartz affording average assays of $8 to $10 per ton. Crosscut No. 2 on the same level has reached the west clay wall.

JUSTICE.—The water in south lateral drift of 1150 level is drained, admitting of much better headway. The vein formation at that point is looking very favorable. The 1300 level lateral south drift, and winze No. 1 on the same level, both show a steady improvement.

UTAH.

ALTA.—Salt Lake *Tribune*, Sept. 4: The town is progressing very fast since the fire. There is not much change in the mines. The Flagstaff mine is working 150 men, and shipping 75 tons of ore per day. Reports on the street state that they have struck a new body of 90-cent ore, the largest body ever found in mine. It is reported they have struck, in the Emma, a small vein of ore from six inches to three feet wide, assaying up in the hundreds. They are working 16 men on eight-hour shifts in the lower levels. Mr. Scrimgeour is working from 40 to 50 men on the old works, digging the low-grade ore, and making it pay him very handsomely. The North Star mine, having been worked on lease, has shut down, but will start up in a few days. The Alta Con. is putting up large hoisting works, and will soon ship as much as the Flagstaff. They are working 30 men. The Toledo mine has changed Superintendents. They expect to make large shipments of ore each month, as they have plenty in eight, and it grows larger and richer as they gain depth. They are working 25 men, have shipped from 100 to 200 tons of ore per month, which assaye over 100 ounces per ton. The Reed & Benson is working 40 men, and shipping from 50 to 150 tons of ore per month. The ore assays into the hundreds. The Ophir mine, owned by H. C. Goodspeed & Co., is worked on a lease, and has struck a large body of high-grade ore. The Windsor Group are worked on lease, and are shipping from 25 to 50 tons of ore per month. They are working four men. The mine looks well. The Frederick tunnel is worked on contract, and is in over 1,000 feet. It is good property. The Gladiator tunnel, worked by contract, is in between 1,600 and 1,700 feet. The Equitable tunnel and mining company have struck ore and are shipping to California. They are to have the machinery completed, and are pushing the tunnel ahead as fast as possible, expecting to cut the vein by the 1st of March. The Davenport mine is working 12 men and shipping from 25 to 60 tons of ore per month. The Lavinia mine, or Grizzly, is working 20 men and shipping 100 tons of ore per month. The Antelope and Prince of Wales are working 65 men, and are shipping 150 tons of ore each per month. The Richmond works are on a lease, and employing 14 men and shipping 35 tons of ore per month. The Wellington, worked on lease, just shipped 25 tons which assayed 150 ounces in silver and 50% lead. The Kate Hayes mine, worked on lease, is working six men, and expects to make regular shipments of ore each week. The Alpha mine, worked on lease, is making regular shipments, and is working eight men. There are several hundred men prospecting. Only one new strike is reported, which is the Blue Bell in American Fork. They have struck a true fissure vein, which is two and a half feet wide, and can be traced several hundred feet on the surface. The ore assays from $200 to $300 per ton. The owners have been offered $16,000, but would not take it.

FRISCO.—*Tribune*, Aug. 31st: Rocky district, situated about 12 miles north of Frisco, is likely to come into prominence as a source of supply for fluxes. There are a number of mines in this district, the ores of which carry iron, silver, copper and gold, and a number of mines are being worked and shipping ores to the smelters. The important mines are the Centennial, Severance, Hickory, and the eight owned by the Big Mountain Con. C. & S. M. Co. Among the gentlemen interested are J. F. M. Rockafeller, Jas. S. Riley, J. R. Lindsay, John V. Easley, D. Severance, M. Terault, A. P. Athertou, and Henry M. Johnson.

News in Brief.

LANCASHIRE cotton mills are closing.

A WATER-SPOUT in Hungary killed 300 persons.

REPUBLICANS carried Vermont by 17,000 majority.

GEN. JOHN C. FREMONT is on the way to Arizona.

GOOD hop pickers can get $3 per day at Puyallup, W. T.

THE McCloud river salmon supply is larger than ever before.

THE western boundary of Jarupa Rancho is to be resurveyed.

GLANDERS among San Francisco horses seems to be on the increase.

CATTLE in large numbers are now being shipped East from Wyoming.

ALL but two of the large saw-mills on Puget sound are running on full time.

THE Nonpariel quicksilver mine in Douglas county, Oregon, has a tunnel in 330 feet, and will soon build smelting works.

SOLDIERS from the North and South meet in friendly union at Marietta, Ohio.

OBERLIN college has conferred the degree of A. M. upon nine lady graduates.

LARGE tracts of good land await settlement in the region of Cowlitz Pass, W. T.

JOHN BIDWELL, of Chico, California, has been awarded a prize at the Paris Exposition.

THE artesian well of Charleston, S. C., furnishes more water than the city requires.

SALES' gold mine, Georgia, has, without machinery, yielded $10,000 since January 1st.

POSTMASTER Gen. Key and friends will visit the State fair on the 19th and 20th instant.

GOLD is found in Ogletborpe and Murray counties, Georgia, as well as in Lincoln county.

IT cost Santa Clara county over $1,400 to elect delegates to the Constitutional Convention.

THE International Monetary Congress recommends a universal standard of one-tenth alloy for gold coins.

THREE Portugese have been fined $50 each for taking salmon out of season from the Sacramento river.

THE rinderpest is rapidly extending throughout Roumania. The authorities have not been prompt enough.

ISAAC BROWN, an octogenarian of Jefferson county, Ala., has ploughed the same field for 62 successive years.

THE Oxford Iron company of Oxford, New York, have failed. Estimated liabilities, $5,000,000 to $6,000,000.

IT is estimated that Delaware's peach export for the season will amount to 700,000 baskets, netting the shippers $575,000.

IN Cincinnati it is said 20,000 kerosene lamps have been sold within the last three months, and 4,000 gas meters taken out.

THE cotton spinners of Northern France have resolved not to work by gaslight, in order to lessen the accumulation of stock.

SECRETARY Schurz declines to interfere with the Land Commissioner's decision opening the large railroad grants to settlement.

LANDS near the line of the Utah N. R. R., in eastern Utah, are being rapidly settled. Farm land by the thousand acres lies idle.

THE New York water supply system has cost since 1842, to complete and maintain it, $34,000,000. Total revenue, $30,000,000.

SIR GARNET WOOLSEY took 6,000,000 pounds sterling to Cyprus to pay for the construction of harbors and other government works.

AUGUST 31st, the El Dorado South hoisting works and quartz mill at Belmont, Nevada, were destroyed by fire. Probably incendiary.

THE internal revenue tax collections for the fiscal year ending June 30th, last, were $104,717,437 accounted for, and $9,705 unaccounted for.

IT is thought that an extensive system of smuggling between England and the United States, is carried through the Mexican Free Zone.

THE Los Angeles Company's well in the Little Sespe canyon has now reached a depth of 1,250 feet, and has penetrated oil-bearing strata.

SEPTEMBER 4th, call was issued for redemption of 5,000,000 of 5-20 bonds of 1865, consols of 1865; 2,000,000 coupon and 3,000,000 registered bonds.

A NEW bonanza has been found within two miles of the Aztlan mill, Prescott, Arizona, which assays from the croppings, in gold and silver, $152 to the ton.

IN the Thames, September 3d, an excursion steamer with about 700 passengers was cut in too and sunk by collision with a propeller. Between 600 and 700 were lost.

AMMONIA from the commercial fertilizers manufactured in the suburbs of Augusta, Ga., has completely driven out chills and fever and other malaria from the region.

CLEARING House returns from 23 cities for August, as compared with the same month last year, show a loss of 8.8%. Kansas City has the largest loss; San Francisco, the largest gain.

THE English and American governments are petitioned through the instrumentality of the International Congress on Weights, Measures and Coins, to consider the adoption of the metric system.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING AUGUST 27TH, 1878.

SEED PLANTERS.—Wm. T. Easterday, Watsonville, Cal.

PROCESS AND APPARATUS FOR MANUFACTURING WATER-GAS. Watson A. Goodyear, S. F.

BROOMS.—Wm. Walter, Arcadia, Washington Territory.

STENCH OR BASIN TRAP VALVES.—Wm. E. Worth, S. F.

TUBULAR NEEDLES FOR EMBALMING.—Samuel Rodges, Los Angeles, Cal.

GRAIN SEPARATORS.—John W. Young, Union, Oregon.

Woodward's Gardens were never more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as usual.

Signal Service Meteorological Report.

Week Ending September 10, 1878.

Gold, Legal Tenders, Exchange, Etc

[Corrected Weekly by SUTRO & CO.]

SAN FRANCISCO, September 11, 3 P. M.

LEGAL TENDERS in S. F., 11 A.M., 99¾@99.90. SILVER, 1¼@1.60. GOLD in New York, 100¾.

GOLD BARS, 890@910. SILVER BARS, 8@15 ℔ cent. discount.

EXCHANGE on New York, ¼%; on London bankers, 49@49¼. Commercial, 50; Paris, five francs ℔ dollar; Mexican dollars, 91@92.

LONDON Consols, 94 15-16; Bonds, 103⅜.

QUICKSILVER in S. F., by the flask, ℔ lb, 41½@42c.

UNION READING ROOMS, FIRST STREET, SAN JOSE. WELCOME TO ALL!—Having lately been removed to the old hall of the City Zouaves, this institution is located in a pleasant and spacious apartment. The latest and best periodicals of the day are found on its tables, free to all. Also many choice volumes upon its shelves. Good music is provided for every Wednesday evening's social. Admission [to these entertainments, 25 cents—to pay expenses.

PIOCHE, Nev., Aug. 17th, 1878.

MESSRS. DEWEY & CO.—*Dear Sirs:*—My letters patent for car brake through your Agency has been duly received, for which please accept my many thanks. And allow me to say that your valuable advice so kindly tendered to inventors through your MINING AND SCIENTIFIC PRESS and circulars, together with the brevity and promptness of your action in securing letters patent to applicants, cannot be too highly endorsed. Again thanking you, I subscribe myself obediently one among your many friends. Respectfully, H. H. GARRISON.

Battle of the Books.

We take the following from the *Argonaut* of Saturday, September 7th. We think it well for persons and associations interested to be well posted in the matter before investing their money in expensive works.

General H. D. Watson, of Johnson's Cyclopedia, reconnoiters in force, and captures the very light brigade that Appleton throws out as skirmishers. Knowlton must get his Ebenezer up, brandish his little hatchet, and come scalping back upon the war-path. Chaw-ink-sky, Warsaw's last champion who shrieked when Appleton's Cyclopedia fell, must rally for another bluff. In this battle of the Cyclopedias, the schoolmaster and the second-hand dealer in old clo'—th-covered novels seem to be getting the worst of the conflict. Watson's last broadside is thus entitled:

The Loet Čauee and Ebenezer Knowlton.

Appleton's revised American Cyclopedia is blighted and doomed. It deserves to be, for it has falsified the facts of history in the interest of a church which has for centuries stood in the way of human liberty and intellectual progress. Let intelligent American parents and patrons and friends of our Public Schools ask themselves the question, Why are the Catholic priests and Jesuitical foes of our Public School system so strenuous in their efforts to force this lying Cyclopedia into the schools of this State? Why do they so zealously recommend the faithful of their flocks to buy this costly and worthless production? No doubt their object is to preserve the minds of the school children of this State and the hearts of their parishioners free from the taint of sectarian prejudice! They have every confidence in a book made by Father O'Reilly, and most heartily sanctioned by Cardinal McCloskey. Why shouldn't they?

And now comes the redoubtable "Professor" Ebenezer Knowlton, after his perilous ascent of Mount Shasta, "alone without a guide" (?), with his deep chest and brawny arms and his "words of learned length and thundering sound," to prop up the falling fortunes of James T. White and his blighted Cyclopedia. The "Professor," however, "having jointly and severally in the aggregate examined over a thousand test topics," comes to the sage conclusion that "the American Cyclopedia is unquestionably and very decidedly the better book." The learned "Professor" would do well to invest twenty-five cents in a composition primer and devote his next year to the mastery of its contents before he ventures to appear before the public in the role of a literary critic. I trust that those who know me will give me credit for possessing too much discernment and knowledge of men and things ever to leave to Ebenezer's determination the merits of Johnson's Cyclopedia, or of any other book. For the benefit of those who do not know me, I will state that I never challenged White to leave the two Cyclopedias to the judgment of Ebenezer Knowlton, or to the judgment of any committee of which the renowned Ebenezer was a member.

The "Professor" accuses me of attempting to bribe him! Will the doughty "Professor" tell the public when, where and how? I assert that I never tried, either directly or indirectly, to bribe Ebenezer Knowlton, and I defy him to prove that I ever did. It is hard for me to say this where many young ladies still live to whom the immaculate "Professor" once exclaimed, "My children, you see before you a man who, thanks to the training of his good mother and the kindness of his Heavenly Father, never told a lie." Oh! Ebenezer, lesser than Washington, yet better, how has the mighty fallen into the hands of Appleton's agent.

And now a word or two in reference to the card of the almost equally renowned Choynski, the far-famed antiquarian who sells second-hand books on Geary street. Let me inform the gentle antiquarian that either he or his friend White can have all the Appleton's American Cyclopedias which he or his friend will furnish bonds to pay for, at the following rates: Revised, in sheep, for $60; agents', price, $96. Condensed American, 4 vols., $10; agents' price, $38. On my return to the city last Saturday I found three cards from the courteous Choynski in my post-office box, in one of which he threatened to publish my offer in last Sunday's *Chronicle* as mere buncombe. Now, to settle this question forever, I hereby challenge either Choynski or White to place $6,000 in the Bank of California of this city, and if I do not deliver at any place they may direct one hundred sets of Appleton's Revised 16 vol. American Cyclopedia for $6,000 within ninety days, I agree to forfeit $100 for every set I fall short, and I will place $6,000 in bonds in the above mentioned bank as an evidence of my good faith in making this proposition. Among the one hundred sets which I am ready to furnish will be those that were kicked out of the Oakland schools by the unanimous vote of the Board of Education of that city, in order to make room for Johnson's Cyclopedia. White has not accepted my challenge, which, I submit, was a fair one. Neither he nor D. Appleton & Co. dare accept it. I dare Choynski or White to put up money to take Appleton's Cyclopedias at $60 a set. H. D. WATSON.

[COM.]

A New Deal.

L. Reynolds, Esq., the Secretary of the Senator Mining Company, announces that the property which is situated in Virginia City, Nevada, and on the north extension of the Julia mine has lately been purchased by a number of gentlemen of large mining experience and extensive capital, and work will soon be commenced upon it; and that the greatest expectations are entertained that rich developments will soon be made. He also states that a limited number of shares will now be disposed of, at bedrock prices, so that those parties who desire to invest can do so prior to the mine being called on the different stock boards. He reports that this company has large and powerful machinery, all complete, is entirely free from debt, and the mine will soon be placed in connection with the Sutro tunnel. It certainly appears that the Senator Mining Company possess a valuable claim, and parties desirous of obtaining stock should call upon Mr. Reynolds at his office, No. 302 California Street, Room 5.

The Pacific Rolling Mill Display.

A display that shows, more than any other in the Fair, the material progress in mechanical industry, which has been made on this coast within the past few years, is that of the Pacific Rolling Mills. It is not very long since that almost any of the articles shown in the display had, if required, to be imported from the East. Now they are all made here by our own mechanics and in quantities to surprise any one not familiar with the subject. The Pacific Rolling Mills are the only ones of the kind this side of the Sierra Nevada, and although established for the purpose of only furnishing heavier articles, now manufactures a line of goods extending into nearly every branch of the business. Although the display made at the Fair is not one to attract the attention of the superficial observer very closely, from the nature of the articles, there is more there than in any other exhibit in the Fair to show our mechanical advancement. It shows results, not machines which produce results, as is the case with most other displays, and its importance is, therefore, not so noticeable at first glance. A closer examination will, however, repay any one interested in mechanical matters, and convince them that we are not behind the East in rolling mill products.

Probably among the first things which attract notice are the ponderous turn-huckles exhibited, two of which are of four and six inch diameter of thread respectively. These turn-bnckles are made from 6-inch down to ⅜-inch, the larger ones being for the heavy halance hobs for mining purposes. Mining machinery has now so greatly increased in size and is made so immense that work oi this class has had to he chased in a lathe, making the expense very heavy. For this reason the rolling mills have procured machinery which will cut thread, for 6 inch turn-huckles, with the same ease as a three or two inch one. The large nuts cut by same machine, up to 6 inches in diameter, are more particularly intended for bridge work.

The large pieces of square iron exhibited are "square irons," or square shafts in hars. The mills now roll, up to 8 inches in diameter, round iron. Shafts of this size were, up to a few years ago forged only at the mills, until then, rolled up to four inch; but as they now roll to eight inch, the cost of larger shafts is materially reduced. Bar iron is exhibited up to six inch, round and square. No eight inch is exhibited, as it is too heavy for convenient handling in such a placc as the Fair. All the hars exhibited, are rolled. Both round and square iron are made from one-quarter inch up to six and eight inch. Flat hars are exhibited from one-quarter inch to 1¾ in thickness, and from three-quarters in width up to 12 inches, all rolled.

A series of sections of rolled heams or girders, from three inches up to 10½ in hight, are exhibited. Two or three of them joined together form double girders for building construction. A peculiar feature in connection with these may be noticed. Instead of box-girders, which are riveted together, and in which the whole strain of the girder is left ou the rivets, these beams are joined two or more together by riveting a flat bar on top, which increases the power to resist the "butting" strain, and does not weaken the iron by an excess of rivet holes. Girders made in this style are much lighter in proportion to strength than those of the old style, being capable of carrying one-third more weight per yard.

The planished, round edge tire iron is a recent article of mauufacture here. The surface of this iron is hardened, and there is a perfectly smooth surface without the tire bsing liable to break hy any sudden jar, as steel would. This iron is rolled with a heavy stream of water pouring on it to chill the surface.

Arranged on the wall is a series of angle iron from three-quarters by one-eighth inch up to five by one-eighth inch. Cross sections of different sizes are shown, all rolled. The mills do a large amount of this angle iron work; they have just rolled fifty tons for the new City Hall. For the iron steamer "Bolivia," which is being lengthened 80 feet at North's ways, they are making upwards of 50 tons of angle iron of different sizes.

Among other things made by these mills are iron bridges, two of which are now being made for the Yosemitc valley. One of these has 100 feet span and the other 90 feet. They are made complete, ready to be set up. One of the same kind was recently shipped to the South Pacific for the French Government. The arch part of these bridges is made of 6-inch channel iron, and the upright parts made of angles made into star bars, the chords being framed of heavy flat links.

Another new hranch of iron manufacture recently introduced at the mills, is that of chain making, and a very interesting exhibit of the results of this work is made. They manufacture chain from one-quarter inch upwards to chain cables of any desired size. Special iron is selected for this work, as only first-class chain is made. A large stock of this class of goods is kept on hand at all times ready for purchasers.

A very large display is made of machine bolts, hot and cold pressed nuts, etc., in boxes. There are also inventions of nuts that are forged, faced and tapped. Track nails, tire-nuts and burrs, etc., are displayed in quantities. Great numbers of these goods are made and kept in stock at the mills, ready packed for shipment.

Of course a large part of the work done by the mills is on rolling railroad rails, aud an exhibit is made of rails of 12, 16, 20, 28, 30, 35, 50 and 56 pounds to the yard. Great quantities of these rails are made. Over 4500 tons were made last year for the South Pacific Coast Railroad Company. They have also two contracts for 2,000 tons, of 28 and 30 pound rail for two roads in Oregon and Washington Territory. Considerahle rail is made for mining companies. This track iron manufacture is now growing to he a great industry, and the mills keep a regular supply of different sizes on hand.

The Pacific Rolling Mills keep at work constantly from 400 to 450 men, the establishment heing a very extensive one and well supplied with all the modern improved machinery of every kind.

For the making of iron, in the rolling mill proper, there are six trains of rolls, each train composing a mill in itself. One train is eight inch, two are 12 inch, and three 18 inch. There are five steam engines connected with the rolls. There are also two saw-engines for cutting off the ends of rails, and there are eight other engines connected with the works. There arc 12 heating furnaces and four puddling furnaces in the mills proper.

In the forge there are two steam hammers aud three furnaces. The forge has a capacity up to a 20-ton shaft. The hlacksmith shop has three steam hammers and one helt hammer. There are in the shop ahout 16 fires, and eight more in the chain shop. The repair or machine shop is well supplied with lathes, planers, drills, shapers, etc.

In the factory are made the bolts, nuts, washers, spikes, rivets, etc. It is of a capacity of 8,000 fish holts a day, and other articles in proportion. There are twelve holt machines, capahle of cutting from one-quarter inch up to six inches; three spike machines, five holt benders, three hot pressed nut machines, five punches for cold punched nuts, etc., one steam and one helt hammer; then smith's fires, etc. A room is also set aside for making the tools used in the various machines. They have also a box shop for making the heavy boxes in which are packed the bolts, rivets, nuts and other smaller articles of manufacture. The mills use ahout 12,000 tons of coal a year, from the Bulli mines in Australia.

From this hrief sketch it will he seen that the Pacific Rolling Mills is an institution of considerahle magnitude, and it has heen so conducted that its products are recognized as first-class in every respect. The managers are continually adding to the resources of the mills, and as fast as any demand arises the machiuary is purchased and product made to meet it. The officers of the company are: Wm. Alvord, President; L. B. Benchley, General Manager; B. P. Brunner, Superintendent; P. Noble, Assistant Superintendent; Chas. M. Keeney, Secretary.

New Incorporations.

The following companies have filed certificates of incorporation:

Eureka Con. B. G. M. Co.—Location: Nevada county. Capital, $5,000,000. Directors—J. H. Thompson, Valentine Schmidt, A. Lusk, George R. Spinney, S. B. Hunt.

Favorite G. & S. M. Co.—Object: To mine, etc., in the States of California and Nevada aud the Territory of Arizona. Capital, $6,000,000. Directors—P. Von Loesecke, Victor Repayre, Julius Peters, P. B. Nagle, J. B. L. Louis.

Lady Alice S. and M. Co.—Object: To acquire mines, mills, water rights, etc, and to run tunnels in the Bodie mining district, Mono Co. Capital, $10,000,000. Directors—C. W. Kellogg, Charles Main, G. W. Fisher, W. H. Sears, C. J, Pillsbury.

Relief Con. M. Co.—To mine in the Bodie district. Capital, $6,000,000. Directors—Wm. M. Stewart, W. F. Herrin, P. Van Clief, W. J. Hutchings, W. W. Foote.

Mackey G. and S. M. Co.—To acquire and purchase mines in Storey conuty, Nevada, etc. Capital, $5,000,000. Directors—J. D. Hunt, H. Harmon, M. C. Murtagh, F. A. Ronleau, M. P. Finnegan.

Bodie H. M. and W. Co.—To carry on placer and hydraulic mining in the Bodie district, and to introduce water into the town of Bodie. Capital, $5,000,000. Directors—N. K. Masten, G. T. Coulter, A. J. Ralston, R. N. Graves, H. M. Yerington.

University G. M. Co.—Location: Mono county, Cal. Directors—N. K. Masten, R. G. Brown, Dwight Chittenden, G. W. Beaver and H. M. Farrington. Capital, $1,000,000.

Callison M. Co. — Location: Esmeralda county, Nevada. Directors—C. L. Weller, J. P. Jackson, E. L. Sullivan, J. P. Jones and J. L. Callison. Capital, $6,000,000.

Middle Hill M. Co.—Location: Esmeralda district, Nevada. Directors—J. M. Walker, W. S. Lyle, R. G. Brown, G. Congdou and W. L. Oliver. Capital, $10,000,000.

San Pedro M. Co.—Location: Arizona. Directors—C. R. Greathouse, B. B. Minor, G. O'Briter, G. Hearst and J. Clark. Capital, $10,000,000.

South Bulwer G. M. Co.—Location: Bodie district. Directors—J. Miller, P. Caduc, J. Hagan, E. O. Weiner and W. Stuart. Capital, $10,000,000.

Ajax G. & S. M. Co.—Location: Bodie district. Directors—R. Sherwood, W. S. Lyle, R. Barton, E. B. Rail and W. F. Meyers. Capital, $5,000,000.

Addenda G. & S. M. Co.—Location: Mono county. Directors—W. F. Leon, M. C. McGlennon, S. Dixon, J. Dixon and T. A. Dixon. Capital $10,000,000.

Davis Pulverizer Manufacturing Co.—Object: To manufacture quartz crushers, known as "Davis' Pulverizers." Directors—J. Neate, J. T. Davis, S. M. Holmes, T. Homer and B. B. Minor. Capital, $120,000.

Prince of Wales Island Copper Co. Object: To mine for copper at and from Karto hay and other points in Alaska. Directors—E. L. Sullivan, J. Currey, W. Sherman, B. Flint and C. T. Fay. Capital, $10,000,000.

Resolute T. M. Co.—Location: Bodie district. Directors—W. R. Davenport, J. G White, W. S. Chapman, T. W. Hadley and F. K. Bechtel.

Orient M. Co.—Location: Bodie district. Directors—F. Tagliabue, J. M. Wilde, V. Fernbach, M. Fernbach and T. H. Lawlor. Capital, $10,000,000.

True Blue G. & S. M. Co.—Location: Bodie district. Directors—H. H. Barling, D. E. Coughanour, B. B. Minor, J. T. McGeoghegan and G. L. Bradley. Capital, $5,000,000.

Headlight M. Co.—Location: Lake district, Mono county. Directors—G. S. Dodge, T. Bell, W. M. Stewart, Sol. Heydenfeldt and A. H. Rose, Jr. Capital, $10,000,000.

May Belle Con. M. Co.—Location: Bodie district. Directors—R. N. Graves, W. M. Stewart, W. B. Carr, W. F. Herrin and A. J. Ralston. Capital, $6,500,000.

Dante G. & S. M. Co.—Location: Nye county, Nevada. Directors—C. T. Fay, J. Moorhead, J. G. Jeffress, C. Gutierrez, H. Pink, J. B. Haggin, M. D., and J. H. Smith, Jr. Capital, $10,000,000.

Helena G. M. Co.—Location: Del Norte county. Directors—H. L. J. Warren, J. D. Gray, J. L. Fields, C. F. Davis and E. P. Hutchins. Capital, $300,000.

Dudley M. Co.—Location: Bodie district. Directors—R. N. Graves, A. J. Ralston, J. M. Quay, W. Haynie and W. M. Stewart. Capital, $6,400,000.

Paradise Valley M. Co.—Location: Nevada. Directors—S. Linktou, P. S. Van Ransaeller, S. F. Gashwiler, H. Jauin and L. W. Greenwall. Capital, $10,000,000.

Rustler G. M. Co.—Directors—W. B. Willard, George Story, D. Crittenden, Robert Sherwood, A. C. Ellis. Capital, $6,000,000.

Bunker Hill G. M. Co.—Directors—Benjamin Flint, C. P. Tinkhone, Albert Heath, Warren Craig and Frank D. Cooper. Capital, $5,000,000.

Golconda G. M. Co.—Directors—Romualdo Pacheco, Geo. L. Bradley, J. Calvert, B. B. Minor, H. L. Burrows, Chas. Webb Howard, J. R. Casonava. Capital, $10,000,000.

Blue Jacket S. M. Co.—Location, Storcy county, Nevada. Directors—James Phelan, A. Hemme, Thos. R. Hayes, S. D. Bullock and Wm. S. Ryrme. Capital, $10,000,000.

Montana G. M. Co.—Directors—Thomas Cole, C. J. Garland, H. S. Flood, F. W. Hadley and C. W. Kellogg. Capital, $2,000,000; shares, 20,000.

Caledonia G. M. Co.—Location: Dakota Territory. Dirctors—Sol. Heydenfeldt, Heury D. Bacon, M. L. McDonald, Frank Locan and J. W. Gashwiler. Capital, $10,000,000; shares, 100,000.

Republic Con. M. Co.—Object: To mine in Bodie district. Capital, $6,400,000. Directors—John F. Miller, Wm. M. Stewart, W. F. Herrin, P. Van Clief and W. W. Foote.

Fairfax M. Co.—Object: To mine in California and Nevada. Capital, $10,000,000. Directors—John W. Coleman, Max Morgenthau, John Rosenfeld, O. H. La Grange and Warren Bryant.

Riquesa M. Co.—Object: To mine in Bodie district. Capital, $10,000,000. Directors—E. McCrary, C. W. Kellogg, J. B. Ingo, Samuel Poorman and Charles S. Pettigrew.

Selby Copper M. and Smelting Co.—Object: To work in Nevada. Capital, $10,000,000. Directors—Thomas H. Selby, D. W. F. Bishee, C. P. Sykes, F. R. Webster and F. A. McGee.

Petroleum in California.

Mr. Edward Maden, a petroleum expert, in a recent interview with a reporter of one of our local papers gave, in substance, the following as to the outlook of this new industry on our coast: As far as present developments go, the crude oil of Ventura county is inferior in lighting qualities to Pennsylvania oil, as it does not give a paying percentage of kerosene. For lubricating purposes it is far superior. The San Fernando oil produces as much kerosene as the Pennsylvania product. The conclusion is not justified, however that the San Fernando wells are superior to those of Ventura, for the latter have not, as yet, heen bored deep enough. They have produced thus far ouly heavy oil, the lightest being about 35°, the greater production heing an unprofitable oil of which the largest portion is tar. The wells must be sunk deeper before conclusions are settled. The crude oil of California contains more sulphur than that of Pennsylvania. This, however, may he so easily removed that it does not injure the commercial hopes of the industry.

The present production is about 150 harrels per day, one-half of which is produced by the Star company's wells. Every month the supply is increased by the San Francisco and Los Angeles companies' wells. This is a mere cipher compared with the cousumption now supplied hy Pennsylvania wells. California's yearly consumption alone reaches 3,500,000 gallons, worth $1,000,000, and the export must amount annually to 4,000,000 gallons. Pennsylvania lays down oil at a very reasonable rate, hut California can compete with her in San Francisco, because of the freight she has to pay and for other reasons. A petroleum refinery is soon to be erected in San Francisco.

The oil may yet be put to many uses to which it has not heretofore heen applied. An Eastern chemist has heen making a special study of the products of California petroleum. He is frequently discovering new resources, and having the henefit of his knowledge, it is hard to say what may yet he found contained in the oil; still we shall commence to manufacture three grades of hurning oil, several grades of lubricating oil, such as are used for lubricating every kind of machinery, and for preserving leather, harness and for tanners' use; also, painters' use, paints, varnishes, roofing compounds, as well as medicinal purposes, in which the products of California petroleum take a leading part.

There is no douht, and it is admitted hy Eastern oil men, that the southern coast of California is full of oil, and if surface exudations are any sign, the country is literally covered with them. The oil industry of California is only heginning to force itself hefore the people of this State, and ere long California will be receiving the large henefits of exportations that are now passing into the pockets of Pennsylvanians. Taking a direct line east and west from Lyon's Station to Santa Clara, the country is very rich in oil of the finest quality, equal in many cases to that of Pennsylvania, and the oil belt is easily traced. Before many years pass, the country will be covered with derricks, and an enormous production had, that will exceed any other commodity on the coast.

Railroad Lands.

Secretary Schurz, in declining to either reverse or suspend the General Land Office Commissioner's decision, hy which large tracts of land covered by grants to railroads were opened to settlement, says: "It has heen, from the earliest history of this Government, one of the most important and heneficent principles governing its land policy, not to favor the creation of large estates, hut to put public lands at such rates and in such quantities within the easiest possible reach of the poor and homeless, that the latter might acquire homes for themselves and their families, and thereby promote a healthy development of the agricultural resources of the country. This principle has evidently heen kept in view hy the law making power when aiding the construction of national highways hy extensive grants of land, and in accordance with it it was wisely provided in this grant that unless lands granted were sold hy the compauies within a reasonable time they should be opened to actual settlement under the auspices of the Government of the United States and under the provisions of the pre-emption law, so that they might be acquired and settled upon by persons of limited means, while the proceeds of such sales are to be turned over to the compauies. I am therefore of opinion that an actual sale to a bona fide purchaser for a valuable consideration within the time limited, is the only disposition which it was iutended hy Congress should exemyt any of said lands from sale uuder the pre-emption law. Counsel have filed certain mortgages, called deeds of trust, executed by said companies, to secure payment of bonded obligations of the same. Counsel argue that execution and delivery of these mortgages was in effect a sale and conveyance of legal title of the companies to all lands inuring to them under such grant. For the purpose of determining the question thus presented, it becomes necessary, not only to fix the character of the instruments executed by said companies, but also to ascertain whether legal title to lands therein described was hy said iustruments conveyed to the trustees therein named."

After quoting various prominent legal opinions on the subject of mortgages, to the general effect that a mortgage is mere security, and does not vest in the mortgagee any estate in land either hefore or after condition broken, and that payment after default operates to discharge a lien equally with payment at the maturity of the debt, the Secretary expresses the opinion that mortgages in the several States and Territories in which land granted hy the Act of July, 1862, and the Act amendatory thereof, of July 2d, 1864, are located, are not at variance with legal title, but simply a pledge, a security, a lien thereon, and that no estate is by such instrument vested in the mortgagee either before or after condition broken. In each and every one of the mortgages presented in this case, the legal title, as well as the rights of sale and disposition of the lands therein described, is retained in the companies, the Trustees endorsing the mortgage with a full knowledge of the limitations of the right and authority of the companies to make the same. While the companies, by the terms of the mortgages, had the right tc sell and dispose of the lands, the Trustees were to receive the proceeds of all sales of lands made. This right of the companies to sell lands having ceased hy virtue of the third section of the Act of July 1st, 1862, the security of the mortgages will be subrogated by monies arising from sales when made by the Government.

In concluding, the Secretary says: "After full consideration, I am unable to find any reason for suspension of my decision of July 23d, 1878, and you will therefore, without unnecessary delay, cause directions to be issued to local officers as therein directed."

The Atlantic and Pacific Forests.—No. 3.

[By Prof. Asa Gray.]

I cannot pretend to account for the extreme magnificence of this Sierra forest. Its rainfall is in winter, and of unknown but large amount. Doubtless most of it is in snow, of which 50 or 60 feet falls in some winters, and different from the coast and in Oregon, where it falls as rain, and at a temperature which does not suspend vegetable action, here the winter must be complete cessation. But with such great snowfall the supply of moisture to the soil should be abundant and lasting.

Then the Sierra, much loftier than the Coast ranges, rising from 7,000 or 8,000 to 11,000 and 14,000 feet, is refreshed in summer by the winds from the Pacific, from which it takes the last drop of available moisture; and mountains of such altitude, to which moisture from whatever source or direction must necessarily be attracted, are always expected to support forests, at least when not cut off from sea-winds by interposed chains of equal altitude. Trees such mountains will have. The only and the real wonder is that the Sierra Nevada should rear such immense trees!

Moreover, we shall see that this forest is rich and superb only in one line; that, beyond one favored tribe, it is meagre enough. Such for situation and extent and surrounding conditions are the two forests, the Atlantic and the Pacific, which are to be compared.

In order to come to this comparison, I must refrain from all account of the intervening forest of the Rocky mountains, only saying that it is comparatively poor in the size of its trees and the number of species; that few of its species are peculiar, and those mostly in the southern part and of the Mexican plateau type; that they are common to the mountain chains which lie between, stretched north and south *en echelon*, all through that arid or desert region of Utah and Nevada, of which the larger part belongs to the great basin between the Rocky mountains and the Sierra Nevada; that most of the Rocky mountain trees are identical in species with those of the Pacific forest, except far north, where a few of our eastern ones are intermingled. I may add that the Rocky mountains proper get from 12 to 20 inches of rain in the year, mostly in winter snow, some in summer showers.

But the interior mountains get little and the plains or valleys between them less; the Sierra arresting nearly all the moisture coming from the Pacific, the Rocky mountains all coming from the Atlantic side.

Forests being my subject, I must not tarry on the woodless plain, on an average 500 miles wide, which lies between what forest there is in the Rocky mountains and the western border of our Eastern wooded region. Why this great sloping plain should be woodless, except where some cotton-woods and their like mark the course of the traversing rivers, is, on the whole, evident enough. Great interior plains in temperate latitudes are almost woodless, even when not very arid. This of ours is not arid to the degree that the corresponding regions west of the rocky mountains are. The moisture from the Pacific which those would otherwise share is, as we have seen, arrested on or near the western border by the Coast Ranges and again by the Sierra Nevada; and so the interior, except for the mountains, is all but desert.

On the eastern side of the continent, the moisture supplied by the Atlantic and the Gulf of Mexico meets no such obstruction. So the diminution of rainfall is gradual instead of abrupt. But this moisture is spread over a vast surface, and it is naturally bestowed first and most on the seaboard district and least on the remote interior. From the lower Mississippi eastward and northward, including the Ohio river basin, and so to the coast and up to Nova Scotia, there is an average of 47 inches of rain in the year. This diminishes rather steadily westward, especially northwestward, and the western border of the ultra-Mississippian plain gets less than 20 inches.

Indeed, from the great prevalence of westerly and southerly winds, what precipitation of moisture there is on our western plains is not from Atlantic sources nor much from the Gulf. The rain-chart plainly shows that the water raised from the heated Gulf is mainly carried northward and eastward. It is this which has given us the Atlantic forest region, and it is the limitation of this which bounds that forest at the west. The line on the rain-chart indicating 24 inches of annual rain is not far from the line of the western limit of trees, except far north, beyond the great lakes, where, in the coolness of high latitudes, as in the coolness of mountains, a less amount of rainfall suffices for forest growth.

We see then why our great plains grow bare as we proceed from the Mississippi westward, though we wonder why this should take place so soon and so abruptly as it does. But, as already stated, the general course of the wind-bearing rains from the Gulf and beyond is such as to water well the Mississippi valley and all eastward, but not the district west of it.

[To be Continued.]

The St. Louis *Journal of Commerce* moralizes: A proof in the falling off of stock-gambling may be gathered by statistics just made up in San Francisco. Sales at the San Francisco Board for the first six months of the year—1875, $125,000,000; 1876, $126,000,000; 1877, $63,000,000; 1878, $48,000,000. This exhibit is a sign of the enforced morality of commercial revulsions. It hints at the doctrine of compensation, and the self-retribution of evil.

Useful Information.

Hints for Workshops.

We glean from exchanges, chiefly from the *Jeweler and Silversmith*, the follow useful hints for workers in the finer manufactures:

A method which has of late years come largely into use for silvering mirrors of various kinds, and notably the reflectors of telescopes and lighthouses, is based on the power of certain chemical reagents to throw down silver in the metallic state from certain of its solutions, etc., the reduced silver in many cases adhering firmly to the surface of the vessel in which the action takes place, or to objects immersed in the liquid. Thus, says *Nature*, if calcium tartrate in a moist state be placed in a glass vessel with a crystal of silver nitrate and a drop of ammonia solution, and the mixture cautiously heated, and made to flow successively over the whole inner surface of the glass, a fine mirror may be developed. Aldehyde, oil of cloves and other essential oils, grape sugar, and some other organic substances, may also be employed as reducing agents, especially the first substance.

A good liquid polish for silver plate is made by taking three or four drachms of cyanide of potassium, eight or ten grains of nitrate of silver, and four ounces of water. Apply with a soft brush, wash the article thoroughly with water, dry it with a soft linen cloth, and polish with chamois skin; neither whiting nor powder of any kind should be used for cleaning and polishing; they only destroy and scratch the silver.

A safe and easy silver test is to scratch the article with the usual testing stone, and apply a little aquafortis. Then lay two or three grains of salt on the spot; and, if pure silver, a milky froth, principally a deposit of dissolved silver, will be found under these grains, while in the case of base metals the salt will turn green, and no deposit is to be seen.

The composition of "Chinese silver" is as follows: Sixty-five and two-tenth parts copper, 19.5 zinc, 13 nickel, 2.5 silver, and 12 cobalt of iron.

Cobalt plating is recommended by M. Graiffe as superior to nickel for many purposes. He praises very highly the extreme beauty, hardness, and durability of the cobalt coating obtained by the galvanic current. He uses as a bath a neutral solution of the double sulphate of cobalt and ammonia.

The following is reported to be the way Swiss watches are "cleaned:" A small stand of gilded brass about one and one-quarter inches in diameter, and turned round in a lathe, is employed. The latter is mounted on a firm base with a stud in the center running up to the plate; on this is engraved the shape of a watch movement with the bridges on it, and the screw holes drilled in. When the watch is taken down the screws are placed in the holes as in the watch, and then left there until ready to put up again. Thus they never get mixed, and may be cleaned by carefully drawing a brush over them. The other arrangement is a tapering punch, something like a "pusher," used for pushing rivets out of pins, etc.; and after cleaning the bridges in a paper, as usual, the punch is pushed in the screw hole with friction enough to prevent slipping. A fine brush is used for finishing.

The following method is given for inserting teeth in watch and clock wheels: Make a hole through the plate of the wheel immediately below the point from which the tooth has been broken. Let its diameter be a little greater than the width of a tooth. Next, with your tooth-saw, cut down where the tooth should stand till you come into the hole. You then dress out, with a head upon it, a piece of brass wire, till it fits nicely into the cut of the saw, with its head in the hole. With a fine graver you then cut a crease into the wheel plate above and below, on either side of the newly fitted wire, after which, with your hammer, you cautiously spread the face of the wire until it fills the creases, and is securely clinched or riveted into the wheel. This makes a strong job, and one that dresses up to look as well as any other.

Making Pencil Marks Indelible.—The *Papier Zeitung*, in a recent issue, mentions a new method for preparing paper for indelible lead pencil marks. Any ordinary drawing paper is slightly warmed and then rapidly and carefully laid on the surface of a bath, consisting of a warmed solution of bleached colophonium in alcohol until the entire surface is moistened. It is then dried in a current of hot air. The surface of the paper becomes smooth, but readily takes the impression of a lead pencil. In order to make the lead pencil indelible the paper is warmed for a short time on a stove. This method may prove very valuable for the preservation of working drawings when a lack of time will not permit the draftsman to finish them in ink.

Restoring Faded Writing.—Manuscripts which have been illegible may be restored by Von Bibra's process of developing faded ink. A solution of tannin is applied with a brush, the excess is removed by a current of water, and the document is dried at a temperature of from 144° to 177°. The solution of tannin should be moderately concentrated. It does not possess the destructive influence upon the paper which is produced by hydrosulphate of ammonia. The writing developed in this manner remains clear and black for several months.

Nickle Plating Iron and Steel.—Simple processes for nickle plating are coming forward in numbers. In a foreign journal M. F. Stolba describes a process for nickel-plating iron and steel by immersion. The operation is very simple. To a dilute solution (5 to 10 per cent.) of chloride of zinc as pure as possible, a sufficient amount of sulphate of nickle is added to color the solution green, which is then boiled in a porcelain dish. Without paying any notice to the precipitation of a basic salt of zinc, the objects to be coated are introduced into the bath (after having been perfectly freed from all traces of grease or rust) care being taken to keep each object isolated. The whole is kept boiling from thirty to sixty minutes, water being added to replace the loss by evaporation. The nickle precipitates on all the clean surfaces of metal, in the shape of a white, brilliant coat, which a longer period of boiling does not render any thicker. The objects taken out of the bath are washed with water holding a little chalk in suspension, after which they may be polished if desired. The chloride of zinc must contain no metal which is precipitated by iron. It is best specially prepared for the purpose desired. A point to which particular attention must be given is that the sulphate of nickle is free from copper. By replacing the sulphate of nickle by sulphate of cobalt, a coating may be obtained whose aspect differs but little from that of burnished steel, which adheres firmly to the metal.

Preparing Wood for Polishing.—The *Cabinet Maker* says: After staining size over with varnish or polish, for mahogany, walnut, and similar woods, finish the surface with sandpaper, No. 0; oil with linseed oil, colored red with alkanet root; let it stand for a time until the oil has thoroughly soaked in; then proceed to fill in the pores with the following composition: Plaster of Paris, 3; tallow, 1; and a little red polish (ordinary polish colored with dragon's blood). Work the whole until it is thoroughly mixed and becomes a crumbly mass. Rub well into the wood with a piece of rag, clear off all the superfluous filling in, and the surface is ready to body in and polish.

Heavy Blast.—The *Engineering Journal* learns that the heavy blast in the limestone quarry of the Gleudon Iron company, near Easton, Pa., was fired on Thursday evening, at 7.45 o'clock, with complete success. The charge was 12,000 lbs (6 tons) of mortar powder, probably the largest blast, not subaqueous, that has ever occurred in this country. It was a complete success, there being little noise, jar, or smoke, while it is estimated that 70,000 tons of rock were displaced.

Good Health.

The Office of Perspiration.

A writer on hygiene for the *Prairie Farmer* makes the following allusions: The amount of perspiration that exudes from the surface of the skin is greatly varied by circumstances. As for example, it is large when the body is surrounded by hot, dry air, even to the extent of five pounds in 24 hours, while in a cold and moist one the amount in the same time may be but one pound. The results of these conditions are often strongly felt by man and beast. We should naturally suppose that if we lose five pounds of water in 24 hours, we should need that large amount of water to supply the place of that which has passed away. And to some extent this is no doubt true. It may have been observed by all who labor that they feel the want of a large amount of drink. The sensation of thirst does not arise from dryness of the mouth or throat alone, but in part from dryness or need of moisture felt by all the tissues. They all employ the throat and mouth to make known their wants. Another fact is not to be forgotten, that the kidneys have duties so similar to those of the skin, that they aid each other. On a cold, moist day the skin is disabled and cannot execute its usual amount of secretion. Moisture checks evaporation from the surface, and cold lessens the caliber of its pores. In this disability of the skin, the kidneys lend a helping hand in relieving the system of its impurities. And so, if the air be hot and dry, the skin is well able to do extra duty and grant the kidneys a recess from their usual toil.

Another fact is worth a passing notice, namely, that the dryness of the skin retains the heat generated within the system and so creates a fever. Relieve the skin, help it to do duty by warm baths or in some other way and the fever disappears. No moisture came upon the surface and so no evaporation and no cooling of the system could occur. On this fact is based the habit of washing the surface two or more times a day, because this process induces evaporation, cools the skin, opens the pores and lets off the heat retained.

In health, perspiration is graduated by the temperature of the air and amount of exercise. On reducing our temperature in hot seasons of the year, not only our health and comfort but our life depends. The ordinary heat of the human body is 98° Fahr. If the air surrounding us is higher, we suffer more or less. Heat disease begins to manifest its power, and the great remedy is the free application of cold water to reduce the temperature of the body and induce free perspiration. Thus it seems perspiration contributes largely to our health and comfort. But to reap its greatest good, we should daily wash the surface and so prevent the absorption of what is waste and poison. Excessive bathing, as practiced by some boys, may be harmful. All that health and comfort can require is simply washing away the excretion deposited on the skin.

Drainage of Seaside Towns.—Among the causes which have most conduced to bar the way to prosperity in the case of seaside towns has been and is inefficient sanitary regulations. The disregard of proper drainage in them has been often commented on and has much prejudiced them in the eyes of visitors accustomed to see sanitary laws better followed. But, secure in their belief in the protection afforded by abundant fresh air, natives are but slowly converted to a belief in the virtues of systematic sewerage. Zymotic disease, however, has gradually proved an effectual tutor, and our seaside resorts have one by one adopted the measures approved of by science and common sense, until nearly all our most favored watering places have fallen in line with well ordered towns. Among the progressive spots, says our English exchange, *Iron*, is Torquay, which a few years ago determined to deposit its sewerage at such a point as to enable the strong current of the Channel to carry it away without the risk of its polluting the beautiful waters of Torbay. This has been at last effected, at a great outlay of money and engineering skill, and now, by a series of tunnels under the various hills on which Torquay is built, the new main drain collects all the branches as they descend towards the sea, and carries the sewerage into the Channel, two miles from the town, at the extreme eastern point of Torbay, at such a hight above the sea level that the tide does not interfere with the perpetual flow of its contents. There are very few seaside towns, if any, which can point to so effective a system of finally disposing of its sewerage as Torquay now possesses.

Poison in Peach Stones.—A fatal case of poisoning by peach stones, which is noted in the French papers as having recently occurred in Paris, should serve as a warning to families in which children are allowed to look after themselves for hours at a time. Probably very few adults themselves know how poisonous peach stones are. The victim of the recent accident in Paris secreted the stones of a number of peaches, and obtaining a hammer, when left alone broke them open industriously and ate them, the result being that he was fatally poisoned by hydrocyanic (prussic) acid. Since the peach season is now upon us, it is well to explain what quantity of poison the peach stone possesses. Writers on toxicology state that one ounce of the kernels contain about one grain of pure prussic acid, and this quantity, it is well known, is sufficient to kill any adult person. Even two-thirds of a grain has very often proved fatal, and indeed may well be regarded as a fatal dose for any child.

Eucalyptus Tea as a Febrifuge.—A reader writes to the *Alta* from Kings River, Fresno county, as follows: In view of the frightful affliction of the South, I need not apologize for offering a suggestion, which is this: That, as all fevers are more or less the result of poisonous malaria, may not an antidote which neutralizes one form of fever, be beneficient in all? Hot tea, made by steeping the leaves of the blue gum, is specific in the case of fever and ague in California. On Kings' River the fever is very malignant. I have known a few cupfuls, taken hot, so as to produce profuse perspiration, effect a radical cure in 24 hours. It can be taken in any quantity, is a good tonic, and sweetened, a pleasant beverage.

The "Anti-Fat" Remedy.—A death is recorded at Chicago from the over use of a patent medicine which is being extensively advertised, with pictorial illustrations, as the "Anti-Fat" Remedy, the object of which medicine is to reduce the flesh of obese persons and keep down corpulency. This death is enough to show that the ingredients of which the medicine is compounded are unsafe, and that people should be cautious how to use it. Educated physicians are very suspicious of all such nostrums, and will be generally found to say that the only way to reduce flesh is by the adoption of a proper dietary regimen.—*Morning Call.*

Killing Fungus in Cellars.—A correspondent recently asked the *Journal of Chemistry* for a simple and effectual remedy for fungus and mould in cellars. A German agricultural journal gives the following: Put some roll brimstone into a pan and set fire to it; close the doors, making the cellar as nearly air-tight as possible for two or three hours, when the fungi will be destroyed and the mould dried up. Repeat this simple and inexpensive operation every two or three months, and you will have your cellar free from all parasitical growth.

Cleaning the Teeth.—A writer says; A good way to clean teeth is to dip the brush in water, rub it over genuine white Castile soap, then dip it in prepared chalk. I have been complimented upon the whiteness of my teeth, which were originally anything but white. I have used the soap constantly for two or three years, and the chalk for the last year. There is no danger of scratching the teeth as the chalk is prepared; but with a good, stiff brush and the soap it is as effectual as soap and sand on a floor.

MINING AND SCIENTIFIC PRESS.

The Week

The press and the reports of the mining share market alike indicate continued activity and hopeful prospects in mining circles. The contract for the ties to be used on the Bodie railroad has been let. Rich strikes are reported in the Richmond mine and also in the Eureka T. & M. Co.'s property. Idaho complains for want of capital. One hundred men, she says, might be profitably employed where one is now at work. Nearly every day the pick is struck into some new claim in Bodie district. In the more northern counties, men, driven perhaps by the hard times, are cleaning out old tunnels and prospecting dead mines, and their prospects are often good. Meanwhile, everything prospers with the more live mines. The Oriental, Sierra county, has struck a pocket that warranted the sending of four or five startling telegrams, the burden of which was: "Never so rich before!" The Meadow Lakers of Nevada county have found a process that will work their ore. The rich Idaho mine, of the same county, has been visited by a French metallurgist, fresh from Europe and representing capital. His presence in the country argues well. A more northern county reports that the bullion shipments of the last two months exceeded the product of the same time in any previous year.

Branch State Prison.—George Rich writes us that the Sacramento foundry has the contract for the branch State prison at Folsom. The foundry will use up some 220 tons of iron for its construction.

Want of Enterprise?

With no censorious spirit, but with a desire to awaken inquiry we wish to ask a question. If, as would be most natural, a foreigner should study our Fair with a view to determining the resources of the country whose metropolis is San Francisco, would it be found in his conclusion that the Pacific coast is the most wonderful mining district of ths world? Would his conclusion go even so far as to decide that a large portion of our time and money is spent in dealing with mines? We all know that such a conclusion would he true. During the last year, out of 409 companies incorporated in San Francisco, over 250 were for the purpose of carrying on mining operations. Among incorporations having their offices in our city the mining companies, during the last month, paid more in dividends than hanks, gas, water and street railroad companies put together. And the amount of our capital that goes iuto non-dividend paying mines is incalculahle. Moreover, we know that foreign engineers, with command of large capital, come to San Francisco with instructions to find mining investments. Yet, if such a one should seek in the Fair to find some guide to his investment—and what is the paramount purpose of a Fair if it is not to show strangers as well as residents what we can do?—we helieve that his search would he a failure, and that his opinion so formed would misrepresent us.

A French engineer, representing several heavy capitalists, has just arrived in San Francisco. He hears that there is a Fair in full hlast. He knows well what a Fair is and what is its purposs, and congratulates himself on having arrived at so timely a season. He visits the Fair even hefore he has presented his letters of introduction and inquiry to mining men in the city. Suppose we join him in his visit, and appreciate as far as we can his impressions.

As might he expected he has little eye for exhihitions of compressed coffee, of milk champagne, of yeast powder, of wire-work, of hair work, of what not, except anything related to mining, and he is somewhat chagrined when he finds that he has accepted from a small hoy a card which directs him to an infallihle cure for the catarrh. He finds some little solace iu an exhihit of lead pipe, and hegins to imagine that he is iudeed among a people that have at least heard of mining when he discovers a little case of hlasting powder. Attracted hy the noise of the machinery, he goes to the north wing of the Pavilion. In his ramhles here he sees a new patent furnace for roasting certain classes of ore. That is very interesting and keeps his attcution longest. The drill that he sees at work he has often observed hefore. A novel propeller pump excites his curiosity and claims much of his time. He notices everything keenly, and leaves this side of the Pavilion, hy no means impressed with the idea that in the exhihit of machinery he has heen exauiniug, machines especially adapted for mining purposes predominate. But of this he is thoroughly convinced, viz: that what he has seen is arranged in a very unsystematic way.

Once more in the body of the huilding, he inquires of several men and hoys where the exhihit of minerals is. No one seems to know. At last, however, he finds a hoy who tells him that what he seeks is "over there under the stairs." He explores uuder the stairs and is ahout to decide that the hoy has some patent notion as to the meaning of "minerals," when he does discover a case of ore from Siskiyou county. Ore, however rich it might he, from one mine, in one county, in one part of the country, placed hy itself alone among miscellaneous exhihits, afforded him no opportunity for comparison and gave him correspondingly little satisfaction. He next spent a few moments looking at the small exhihit made hy a metallurgist. The novel inventious and the few rare specimeus excited some little intcrest, hut he had not found what he was seeking. In the course of much wandering he discovered four piles of coal, two of them separated from each other and from all their relations, and two placed side hy side, giving him the first sign of that useful systematic arrangement for which he had been looking. Though shy of small hoys with advertisements ever since he had the adventure with the catarrh, he ventnred to accept another card from a man. The card was a notice of a Cleveland mineral oil company. Little interested in this, he coufided to the man his trouhles. He was directed to an exhibit made by a publication company. Here again he found the principle of consecutive display hinted at, but, as with the two coal piles, in a very meagre and unsatisfactory way. Here were collected, laheled and placed side hy side, specimens of different minerals from different parts of the State. He found there marhle from different parts of California, borax from Nevada, salt, lime-stone, antimony and copper ores, magnetite, hematite, chromite, and numerous varieties of that inevitahle coal. There was nothiug striking ahout the specimens, but the right idea of exhihit had heen conceived.

Would any Californian feel satisfied to have this Frenchman form his estimate of our mineral wealth from what we have watched him examining? Certainly not. Nor did he do so. He found in the catalogue that in the art gallery there was a magnificent display of minerals. He visited the gallery.

Perhaps the best description of Hatch's display of minerals at the Fair is to say that it is placed just where it belongs, viz: in the art gallsry. It is indeed a work of art, and possesses many of the requirements of a good painting. It has heautiful and variegated colors, whose naturalness no critic dare question. And with the attraction of its numherless natural tints and hues it has that which relates it still more closely to a successful painting, the element of suggestiveness. As one looks at it half hewildered, striving to comprehend the richness that it represents, and to realize the full significance of the depths to which man has hurrowed to hring to light some of its individual memhers, California ceases to have dull hrown hills, mines are remembered no mors as dismal, damp holes where men meet death almost as often as gold, and over our whole coast there settles down the mantle of the Arabian Nights. But stop! This mood will never do for the close-fisted, practical century that hoasts itself the nineteenth. If you want to indulge in such an opium-tainted atmosphere, go and huild a shanty in some younger country as Turkey, and consent to live on dreams and die. But here, with somehody else's hard cash jingling in your pockets, and somehody elss's telegrams arriting every day with the order, "Invest, invest," and the admonition, "But look out for wild-cats and picked specimens," hers is no place for auy but cool, clear-headed men.

But what has all this to do with the "Mineral Exhibit?" Much. Our criticism on Hatch's display is this, namely: That it is hetter calculated to dazzle and hewilder than to convince; that, to a practical man seeking an investment, this collection is not good for its face value. Suppose the Frazer Combination Company, on the ocean heach, wanted to acquaint the puhlic with ths value of their claim. Suppose, that in order to do so they took the following course: They washed a ton or so of the sand, carefully collected the "colors" and put them in a highly polished silver plate. Then they picked up all the pretty shells they could find around their claim, had them nicely polished, added a piece or two of coral, and then neatly arranged them all around the edge of the plate. This plate they put on exhihition to convince the puhlic that their claim was rich. Now, we would not advise them to haul a ton or so of heach sand from their claim aud have it dumped in the Pavilion as a specimen from their mine. But we do think that if the silver saucer with its "colors" were supplemented hy a few hottles of the original sand, a circular or two stating how much sand would yield so much "colors," and a picture or pictures showing the machinery used and the manner of extracting the gold, we think, we say that the attractive saucer so supplemented would convey a far more practical idea of the combination claim than the clean gold with its fringe of shell and coral could alone. And a series of similarly complete exhihits, representing all the miuing or mineral-hearing counties in the State or on the coast, would furnish inquirers with a comprehensive field for comparison, and one opportunity to make intelligent choice. Such exhihits could not injure hona fide mines. Nor would they cost a great deal, for much ore is already sent to Sau Francisco for sampling and working, and it is the freight on the ore that would be the principal expense.

We have numherless, worthy mineral sections that are longing for capital to come and give them a trial. We have numberless, idle capitalists that are longing for somcthing worthy to try. A little enterprising effort on the part of claim-owners would hring these together so as to henefit all concerned. And a fair is the appointed place and time. If a man owns chrome iron ore in San Luis Ohispo, let him exhihit some of it and puhlish his needs. Alongside of this exhihit let the man who owns chrome iron ore in Del Norte, or in Sacramento, or iu Nevada, display some of his ore, and tell how much capital will develop his mine and what market the product will find. Let the owner of copper in Shasta exhihit his copper and a map of the deposits, alongside of ores from Calaveras. And with coal from Sonoma and Contra Costa, and Monterey, and Los Angeles, and horax from Lake and the country east of the Sierras, gold-hearing quartz and gravel from how many counties even miners could not tell, with marhle from here and there and magnetite and argentiferous galena and quicksilver ores from north, south, east and west, and with what not in the shape of minerals from everywhere on the coast, we would have material enough to fill one whole wing of the Pavilion with a most useful and rational exhihit. And in this exhihit, we may add, we would put at least a card from some California mineral oil company, and not let Cleveland come 2,000 miles and get ahead of us.

This plan may he too sanguine. It must be very much so in order to make with the reality a tolerable average. For, while complimenting Hatch on his energy and good taste, and Phillips on his acknowledged ingenuity, the *Journal of Commerce* for illustrating, as far as outside co-operation enabled them, the correct principle of exhihition, congratulatiug the Klamath mine on its richness, and blaming no one in particular, we must state as our most charitahle conviction, that the "mineral exhihit" at the Fair is unjustifiably poor, and in fact hardly can claim existence under its quoted name. And not pride alone, hut the money bump as well, urges to greater enterprise at the next exhihition.

Trade dollars have only a hullion value, and should not be received for the face. This is not news, but it is well to note it.

The Chemical Section.

It is with much pleasure that we rscord the first working meeting of the Chemical Section, whose formation has already heen recorded in the Press. The meeting to which we refer was held on Friday, August 30th, at ths chemical lecture rooms of the University of California, where, on account of the hetter facilities, apparatus, etc., afforded hy the laboratories, the meetings will bs held for the present. The meetings will he held monthly. The memhership of the section is not very large as yet, and will he strictly limited to such persons as are either professional chemists or who have received a thorough chemical education. The purpose of the section heing the development of pure and applied chemistry, the memhers should he selected with the greatest care.

Even with the present limited memhership, the various sides of chemical science are already tolerahly well rspresented, *e. g.*: analytical chemistry, physiological chemistry, metallurgical chemistry, agricultural chsmistry, mineralogical chemistry, chemical geology and organic chemistry.

The list of members is as follows. Prof. W. B. Rising, President; Jno. Ls Conte, Prof. Jos. Le Conts, Prof. Hilgard, Dr. G. F. Beeker, A. W. Jackson, S. B. Christy, J. M. Stillman, Edward Booth, August Harding; and it is expected that other memhers will soon he added to the roll. Ths officers of this section are as follows: President, W. B. Rising, Professor of Chemistry at the University of California; Vice-President, Jno. Le Conte; Secretary, J. M. Stillman; Treasurer, A. W. Jackson; Council, Profs. Jno. Le Conte, Jos. Le Conts and W. B. Rising. The president elect, Prof. Rising, on opening the meeting, made a short but pertinent address, which we print in another column.

A paper was then read hy Mr. S. B. Christy, on the "Oceau Placers of San Francisco." Mr. J. M. Stillman followed with an interesting description of the recent artificial preparation of indigo hlue hy Prof. Baeyer, of Munich, and some other recent discoveries in the domain of organic chemistry. Prof. Hilgard exhihited some specimens of a fihrous plant from Fresno, which, hy the process of rolling, gives a strong fiher, stronger than hemp, and which may perhaps be found to furnish a good material for bagging and similar coarse fahrics. He also exhihited a kind of water plant or conferva from Colusa, which exists in various other parts of the State, and which exhihits the characteristics of a natural hatting, resemhling very much in appearance ordinary cotton hatting.

Mr. A. W. Jackson gave an interesting ahstract of a method of micro-chemical analysis, which has heen recently developed for the detection of the metallic hasis under the microscope hy means of hydrofluosilicic acid. After discussion the meeting was adjourned.

We have long heen waiting for the work of these sections of the academy to hegin. We shall follow the work of the Chemical Section with much interest.

Post-office News.—Post-offices estahlished: Herrick's Cross, Tulare county, Cal., Peter P. Davis, Postmaster; Pinole, Contra Costa county, Cal., Bernardo Fernando, Postmaster; Silverado, Los Angeles county, Cal., P. A. Clark, Postmaster; Klamath Agency, Lake couuty, Oregon, Linus M. Nickerson, Postmaster; Patterson's Mills, Douglas county, Oregon, Wm. Patterson, Postmaster; Willamina, Yam Hill county, Oregon, Jackson Munro, Postmaster. Offices discontinued: Madeline, Lassen county, Cal.; Falcon, Elko county, Nevada. Postmasters appointed: W. J. Johnson, Black Bear, Siskiyou county, Cal.; James W. Malone, Davis Creek, Modoc county, Cal.; Jacoh Boringer, Eagleville, Modoc county, Cal.; Wm. L. Cole, Mountain House, Sierra county, Cal.; James Deroice, Oasis, Gilmore county, Cal.; John Beam, Pine Grove, Esmeralda county, Nevada; L. W. Ballard, Slaughter, King county, Washington Territory.

Iodine Manufacture.—W. B. Jones, of Benicia, tells us that he has made further experiments with Pacific Coast seaweed, more particularly *Laminaria Andersonii*, with a view to determining the practicahility of the profitable production of iodine on our coast. He promises to give us a more detailed account of his work, and we will merely say here that he helieves a fair profit could he made at this new industry. Since the publication of his first article on the subject in the Mining and Scientific Press of August 10th, the San Francisco *Alta* has noticed his work, without, we helieve, giving us the credit of its first publication. H has received a letter from a gentleman in I Angeles, who says he has some thoughts of a tcmpting the manufacture of iodine.

Mr. Wm. E. Smith, for many years a prominent tclegraph official in the southern part of this State, hut latterly engaged in mercantile husiness in Arizona, has purchased an interest in the Pioneer Reduction Works of this city, with Mr. G. F. Deetken, the well-known metallurgist. These gentlemen are greatly enlarging the capacity of the works, and will hereafter confine themselves to the purchase and reduction of gold, silver and copper ores. See their card in this issue.

The Oakland Harbor Improvements.

Among the few things for which the Pacific slope can conscientiously feel gratified to the general government, we must certainly count the improvement of the Oakland harbor as one of the most important. There is perhaps no way in which the people can be made to feel more directly and more pleasantly the influence of the central government than by those noble pieces of engineering, which have for their object the improvement of the natural resources of an entire community. Such undertakings, in order to be of any practical value, have to be considered from so many sides before they are begun, require such a long period of time for completion and usually involve such an immediate expenditure of large sums of money that no individual or corporation would feel justified in waiting for the small and uncertain returns that would be its recompense.

It is not any less important to the widely separated States of our Union than it was to the provinces of the Roman empire that the feeling of national unity be made as pleasant as possible. If we are ever to have a distinctly American civilization, an influence tending to unify their widely diffusing interests can be neglected.

Among these influences none are more permanent or affect a greater number of the people than these large engineering improvements. There is no nobler or more lasting monument to the Roman civilization than the magnificent causeways which are even yet the admiration of the world.

There is still another reason why these undertakings should be taken in hand by the government, a reason which those of a cynical turn of mind will appreciate perhaps more than any other. Money spent in this way at least gives the people some return for their taxes, and if it did not go in this way something worse might be done with it. And we are of the opinion that for money spent under the direction of our Government Engineers, who are at least men of honor and gentlemen, our people have more chances of getting an adequate return than usually falls to their lot in the apportionment of public moneys.

For the benefit of such of our readers as are not familiar with the harbor, we give a brief description of the situation. Oakland is situated on the eastern shore of San Francisco bay, and as San Francisco can be reached by land only by going around the head of the bay and up the peninsula, Oakland is naturally the landing place of the traffic through San Francisco to the Eastern States. Now Oakland is situated on an extensive plain, which forms the whole of the eastern side of the bay and which does not cease when it reaches the shore line, but extends out into the bay for nearly two miles. The whole of this country, as far up as the foothills, has probably been deposited by the tide waters of the bay, checking the velocity of the silt-bearing stream of the Sacramento river. Of course this necessitated the building of a wharf two miles in length to reach deep water. Over this long wharf all the railway traffic with the Eastern States has been carried on for several years. But the piles of the wharf are being constantly attacked by the *toredo*, and some other means of communication has long been needed, not merely for the accommodation of the Central Pacific Railroad Company, but by the whole community. The railroad company made an unsuccessful movement some years ago to secure Goat island for their terminus. To this they intended building a solid roadway. But the natural harbor existing in San Antonio creek at last began to secure the attention due it. This creek and the adjacent region is shown in the accompanying map, which is taken from a coast survey chart. It will be seen what a fine harbor the creek forms, when it is remembered that it has naturally a depth of from 14 to 18 feet. The only difficulty in the way was a very extensive bar at the mouth, which at low water only had two feet of water upon it.

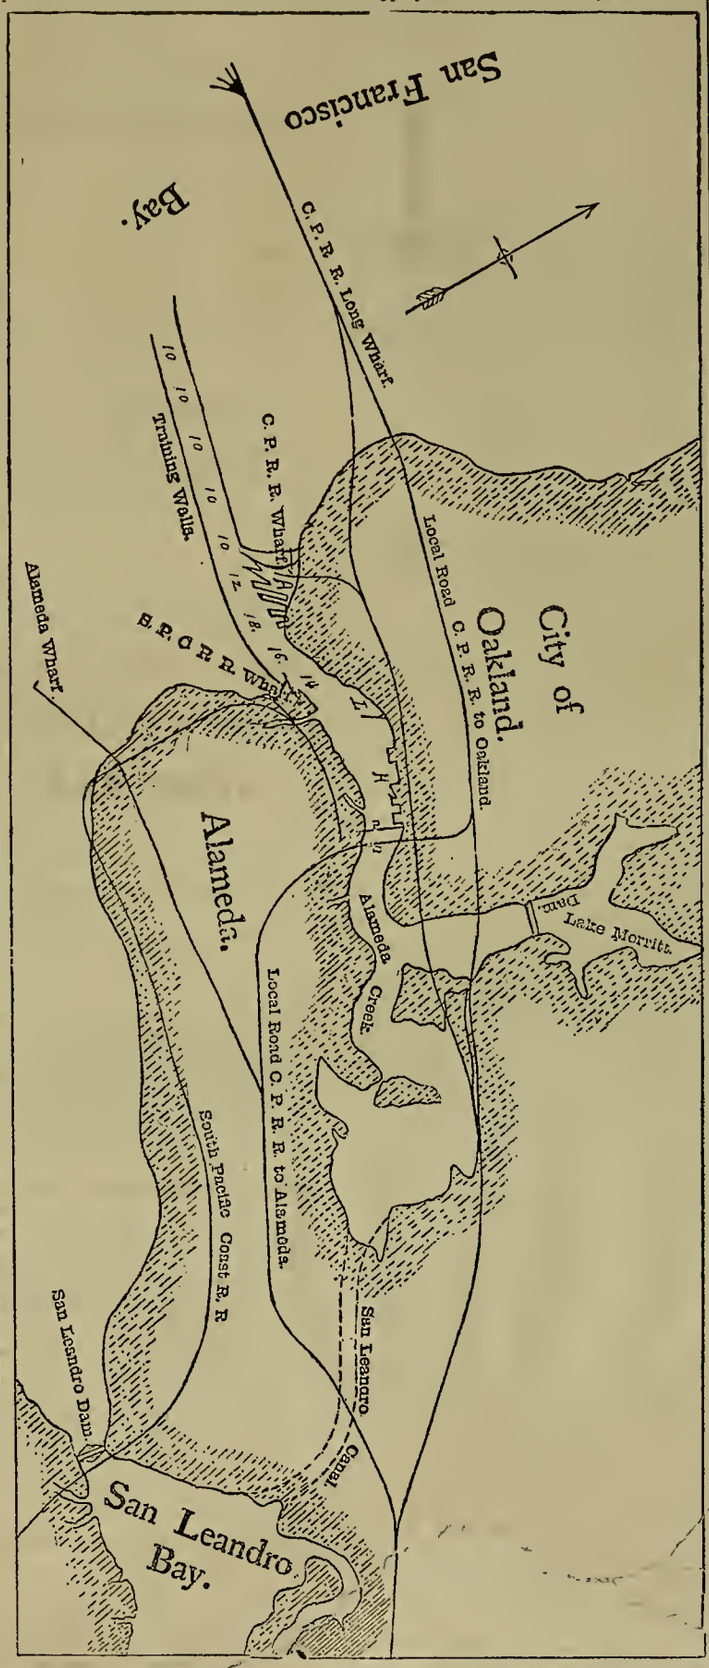
The first action by the Government was taken by the 42d Congress, which directed an examination of San Antonia estuary, and a report upon the most feasible plan for rendering it navigable. This was undertaken by the Board of Pacific Coast Engineers, consisting of Gen. B. S. Alexander, Major G. H. Mendell, and Col. C. S. Stewart. These gentlemen made a thorough examination and gave a favorable report in 1874. They found that the tide in the adjacent San Leandro Bay (see map) rises a little higher and falls a little lower than in San Antonia creek, the difference being four-tenths of a foot. The times of high water were also earlier at the former than at the latter place by about one hour. The reason of this, by the way, is evident in the different forms of the respective bodies. The extreme difference of high and low water, in the creek, is 10 feet. The mean difference is four feet. The tides are 25 minutes later than at Fort Point. In view of these facts and others to which we have already alluded, the gentlemen recommended a plan which is now being carried out. It is as follows:

1. To build parallel training walls of stone 1,000 feet apart from the mouth of the creek and across the wide mud flat out to deep water. The purpose being, of course, to concentrate the tidal current upon the bar at the month, and thus to partly remove it.

2. To double the amount of water flowing out by adding the tidal prism of San Leandro Bay.

This, it was estimated, was nearly equal to that of the creek itself, and if it could be done would greatly increase the scouring action of the current.

The order in which the work was to be accomplished is as follows:



MAP OF OAKLAND HARBOR IMPROVEMENTS.—A. New wharf and two slips of the C. P. R. R. L. Market street wharf. H. Broadway slip, C. P. R. R.

1. Building of training walls.

2. Digging canal connecting San Antonia creek and San Leandro Bay.

3. Dredging of deep water at the mouth of San Leandro Bay with tide gates opening inwards to admit the tide, but closing automatically when the tide falls, thus compelling the whole tidal prism to find its exit by the way of San Antonia creek.

4. The excavation of the tidal basin at the head of the creek.

5. Protection, by stone embankments, of such portions of the banks as will be injuriously effected by the scouring of the current.

It is expected that when the work is completed there will be a channel from the head of the creek to deep water containing 18 to 20 feet of water at low tide.

The estimated cost was $1,736,985.20. In 1875 Congress made an appropriation of $100,000, in 1876 another of the same amount, in 1877 one of $75,000. In 1878, of the $275,000 appropriated, $20,000 remained in the hands of the Board, and they only asked for $80,000 as the appropriation for the current year.

The work was begun by the Board in 1876, and is being carried out under the immediate supervision of Louis J. LeConte, son of Pres. John LeConte, of the University of California. The training walls have been completed since then out as far as deep water. These walls, as built at present, are 10,000 feet long, and on an average 800 feet apart. They are shown on the chart. They are built of broken or "random" stone, from Angel Island and Telegraph Hill. These walls contain 13,8560 tons of rock. Its top is at present 5 feet above low water. This "random" stone is intended merely as a foundation. The intention is to build a concrete wall upon this, to be eight feet above low water, four feet wide at the top where the wall begins, and increasing in width as it goes out into deep water, until at the extremity it has a width of 15 feet. The contracts for this work are shortly to be let. The random stone wall is protected from the sea on the northern side by the long wharf of the C. P. R. R. Co., so that the slope of the wall is only 1 to 1 on that side; while on the southwest it receives the full force of the prevailing sea, and it has taken a slope of 1 to 2. On both sides of the channel, on the outside of the wall, there is a rapid deposit going on. On the north side this deposit has increased six feet, and on the south side four feet since the wall has been built. This deposit runs from the shore out for a thousand feet. No danger is apprehended from it, at least at present.

The present channel is dredged 200 feet wide and is 10 feet deep at low water. Vessels of this draft can enter as far as the city front at low water. At high water vessels drawing 16 feet enter with perfect ease and safety, and the creek is becoming a very popular place for seagoing vessels of the larger class. The bottom, as has been discovered by dredging, is composed of three layers. The top is sandy, below this is a very tough blue clay, while below this at the depth of 15 feet (below low water) is the "hard pan," which is a soft yellow sandstone mixed with clay. This substance exposed to the air becomes very hard. The present bottom is in the blue clay, but the bed of the creek will eventually be the hard pan. The bottom at the end of the wall seemed much softer, the wall sinking at this place two feet (the maximum), but it seems to have reached a firm foundation. The action of the tides seems even at present to hold its own against sedimentation. The soundings in the channel do not show any tendency to shoaling during the past year. The effect of the improvements already made foreshadows what an impact piece of work this will be when it is completed. In the map at *A* are seen the slips and extension wharfs of the C. P. R. R. Co., which are now in process of erection. It is the intention to transfer all the freight car traffic to this place, and save the long wharf for the Berkeley and West Oakland traffic.

At present, as is well known, much of the local freight and passenger traffic goes by the creek route. The steamers *Capital* and *Amador* make hourly trips to the Broadway wharf, shown on the map at *H*. The trip is made to Broadway in 30 minutes, as against 45 minutes by the other route. On the opposite bank from the C. P. R. R. Co.'s slips is seen the wharf of the Bay and South Pacific Coast Railroad. These were described in a late issue, and we will only add that since that time four trips are made daily from San Francisco for this wharf by the steamer *Newark*, connecting with trains for the various stations of this road. All of these new wharfs are on the line of the new channel. There are at present numerous steamers drawing from five to 10 feet of water, a fleet of small craft and several square-rigged vessels within the harbor.

The next step will be the digging of the San Leandro tidal canal, shown on map. This will be about a mile long, 400 feet wide and will contain eight feet of water at low tide. After this is finished, the next step will be the building of the dam at the mouth of San Leandro bay. (See map.) This will have sectional gateways of sufficient dimensions to admit the incoming tide, and opening inward so that they admit the incoming water, but shut automatically as soon as the water begins to fall.

There is no doubt that the advantages to be derived from these improvements will be worth to the community many times what they cost. It is an advantage also which the humblest shares with the wealthiest, and we hope to see more work of this nature undertaken by our Government engineers. It is estimated that if Congress does not cause any delays by failure to provide funds, that the minimum time required to complete the work will be three years. Meanwhile private enterprise and the public at large is reaping the benefits of the work already, and we hope that a short-sighted policy on the part of our Congressmen will not put any obstacles in the way of a good work so well begun.

DOUBLE PROPELLER PUMP.—The attention of visitors at the Mechanics' Fair has been directed to the Follansbee Double Propeller pump by the enormous and continued stream it pours forth. It is one of the most powerful lifting pumps ever put before the people, and is so simple that any one can see at a glance what its capabilities are. It requires no oiling, and any one of them over six inches in diameter can have an engine attached direct and thus avoid the use of belting, which makes invaluable for wrecking purposes, pumping water out of vessels and irrigating and draining work. It will be on exhibition at the State Fair also, and the agent or the Follanshee Pump Company, Boston, Mass., will send circulars and furnish pumps of any size. Manufactured at Golden State and Miners' Foundry, First street, San Francisco.—*Fair Catalogue.*

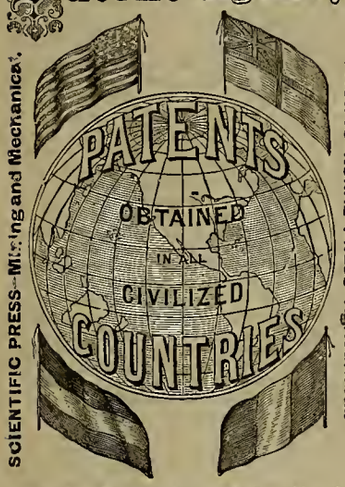
THE gold on the Whitewood, below Deadwood, is found in the gravel from the top to within half a foot of bed rock, but none to speak of on the rock.

THE principal place of business of the Klamath quartz mining company has been changed from Siskiyou county to San Francisco.

DEWEY & CO'S

SCIENTIFIC PRESS

Patent Agency.



Office—202 Sansome St., N. E. Cor. Pine, S. F

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the largest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

DEWEY & CO.,

Patent Solicitors,

No. 202 Sansome St., S. F.

The Mining & Scientific Press,

is the leading mining journal in America, and it enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, postage prepaid, $3 a year in advance. Sample copies, post paid, ten cents.

DEWEY & CO. Publishers, S. F.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal.*

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco.*

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era.*

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly.*

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald.*

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta.*

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner.*

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter.*

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York.*

Sold by Dewey & Co., at this office. Price $10.50.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.

This is necessary to protect us and subscribers against the acts and mistakes of others.

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, $2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

THE EXPLORERS,' MINERS' AND METALLURGISTS' COMPANION.—Comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy; containing 672 pages and 83 engravings. By J. S. Phillips, M. E. Price—cloth, $10.50; in leather, $12; postage 50 cents. Sold at this office.

MODEL MAKER AND MACHINIST.—I. A. Heald, No 514 Commercial St., San Francisco, (fourth floor).

SACRAMENTO SEMINARY.

SACRAMENTO, CAL.

The Sixteenth annual session of this Institution commences Monday, August 5th, 1878. Young ladies will here find superior facilities for a thorough and finished education, and a home of culture and refinement. The music will be under the direction of Prof. John P. Morgan, founder of the Musical Conservatory of Oakland. For further particulars address,

MRS. HERMON PERRY, Principal.

J. HEPBURN,

Mechanical Draftsman and Engineer

No. 214 Sansome Street, (Room 29,) S. F.

Working Drawings Furnished. ☞ Premium obtained or Designs furnished the city for proposed Steam Fire Launch.

SUMMER RESORT.

Exhiliarating Climate! Grand Scenery!!

☞ Persons intending to spend a few weeks in the country during the summer months should stop at the Bridge House, on the South Yuba. Accommodation may be had for a few more boarders by addressing MRS. R. H. CULBERTSON, Emigrant Gap. House only one mile from the station.

HEMORRHOIDS OR PILES,

A treatise on their scientific treatment and radical cure, by E. J. FRAZER, M. D., San Francisco. Price, 25 cents; for sale at the bookstores and by the author at 221 Powell street. Sent by mail to any address on receipt of the price in coin, currency or postage stamps.

Call the attention of the public to their extensive display of

WATCHES, DIAMONDS, JEWELRY AND SILVERWARE.

The largest stock in the City at the lowest prices.

Goods sent to all parts of the Coast.

Watches repaired in a superior manner.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

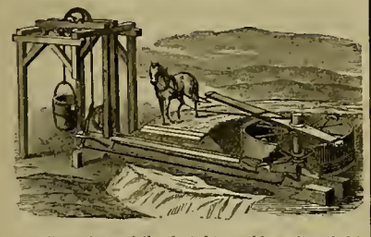
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street, San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 3 50
One man, per day	3 00
Wood, 1¼ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

RUPTURE.

Another Wonderful Cure Effected by CALIFORNIA ELASTIC TRUSS!

CALIFORNIA ELASTIC TRUSS COMPANY, W. J. Horne, Proprietor.—DEAR SIR:—I feel that I owe it to you and to humanity to write the fact that I have been SUBSTANTIALLY CURED of a bad case of Rupture of 30 years' standing, by one of your Incomparable Trusses, which I purchased from you three months ago. I cannot describe the suffering, both physically and mentally, that I have undergone during that period; and now I feel like a new being. I have worn all kinds of Trusses, both Steel and Elastic, and never received any permanent relief until I tried yours. Its simplicity of construction, and facility with which it can be adjusted, and the ease and perfect freedom to the motions of the body with which it can be worn without causing any irritation, are its chief merits, and it is a perfect supporter. I have not had any sign of a return of the Rupture since the first day I put it on, and feel that I am PERFECTLY CURED. It is invaluable, and the fact should be known to the world. You can refer anyone to me on the subject of their merits.

I am truly yours, ALFRED J. BURKE,
Chief Mail Clerk S. F. *Daily Evening Post.*
San Francisco, July 20th, 1878.

Endorsed by the Medical Profession.

SAN FRANCISCO, July 9th, 1878.

California Elastic Truss Co.:

After practicing medicine many years in this city, during which time I have had an extensive experience in the application of all kinds of Trusses, I can and do recommend yours as the best in every respect, for it is as near perfection as modern science can make it. It has many advantages over the torturing steel-hoop Trusses, which inflict great injury on the hips and spine, bringing on other distressing ailments, such as lumbago, morbid affections of the kidneys and numbness in the lower limbs, all of which are avoided by wearing the California Elastic Truss. It is not only a perfect retainer, combining ease and comfort, but the pressure can be changed to any degree. It also remains in the proper place at all times, regardless of the motions of the body, and is worn night and day with perfect ease. It is superior to any of the Elastic Trusses now in the market, while it combines the merits of all. 1st—It is easily adjusted on and off with snaps, doing away with straps and buckles. 2d—The universal spring between the plate and pad prevents all irritation, which is a godsend to the sufferer. 3d—The pad is adjusted on and off in an instant, and can be changed for any other size and form most suitable to the case. In fact, it combines every quality essential to comfort and durability, and is unequalled in lightness, elasticity, natural action, and artistic finish. Many of my patients who are afflicted with hernia are wearing them, and all shall in the future, for I think the great ease by which these purely scientific appliances are made efficacious, is truly remarkable. You can refer any parties to me on the subject of their merits. I remain yours truly,

L. DEXTER LYFORD, M. D.,
Physician and Surgeon,
609 Sacramento street, San Francisco.

A Physician's 45 Years' Experience.

COLUMBIA, Tuolumne Co., July 16th, 1878.

W. J. Horne, Esq.—DEAR SIR:—For some time past I have used, in my practice, the California Elastic Truss, with entire satisfaction in most cases of complicated hernia of both sexes. During a practice of 45 years I have found no Truss that would, with the same ease and certainty, retain the required adjustment, the pressure being always under the immediate control of the patient. The simplicity and ease of application is of itself a guarantee to every experienced physician. I have the honor to remit by mail the amount due, knowing that I contribute to the alleviation of afflicted humanity.

Yours truly, J. P. TIBBITS, M. D.

It is constructed on scientific principles and sells on its merits. If you want the best Truss ever manufactured, don't forget the name and number.

Trusses forwarded to all parts of the United States at our expense, on receipt of price.

Send for illustrated Catalogue and Price List, giving full information and rules for measuring.

CALIFORNIA ELASTIC TRUSS CO.,
615 Sacramento Street, San Francisco, Cal.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of seme of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

Mining Share Market.

The activity in the mining share market points to the dissolution of old "Hard Times." Last week a big bonanza was predicted and men watched the Sierra Nevada. The big bonanza came, but was not so big nor so steady as was wished. Sierra Nevada was propped up above $200 by reports of ore. But at that hight was unsettled and fell again, under the influence, so think the Virginians, of a declared false report of uncontrollable water in the bonanza incline September 6th. Julia had a bonanza that should give assays of from $300 to $400 September 7th. Julia's bonanza turned out base metal. No fluctuations of consequence resulted.

Mining and Other Companies.

Persone intereested in incorporated sharee will do well to recommend the publication of the official noticee of their companies in thie paper, as the cheapeet appropriate medium for the eame.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (89) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

Gover Mining & Milling Company.—Lo-

cation of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of August, 1878, an assessment (No. 37,) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Monday, September 23rd, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, October 21st, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal

Keystone Quartz Mining Company.—Prin-

cipal place of business, San Francisco, California. Location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of August, 1878, an assessment of fifty (50c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at the office of the Company, northwest corner Pine and Sansome streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of October, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-eighth day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Mariposa Land and Mining Company of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, California.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 14) levied on the tenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows.

And in accordance with law and an order of the Board of Directors, made on the tenth day of July, 1878, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, oom 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on Monday, the ninth day of September, 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. LEANDER LEAVITT, Sec'y.

Office, Room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

POSTPONEMENT.—The above sale is postponed until Wednesday, the twenty-fifth day of September, 1878, at the same hour and place.

By order of the Board of Directors.

LEANDER LEAVITT, Sec'y.

Orion Mining Company.—Location of Prin-

cipal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Pocahontas Gold Mining Company.—Lo-

cation of Principal Place of Business, San Francisco, California. Location of Works, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of August, 1878, an assessment (No. 14) of One Dollar and a Half ($1,50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 9, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Wednesday, the 23rd day of October, 1878, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

M. C. SOUTHARD, Sec'y.

Office, Room No. 9, 411½ California street, San Francisco, California.

South Comstock Consolidated Silver

Mining Company.—Notice.—A meeting of the stockholders of the South Comstock Consolidated Silver Mining Company will be held on Tuesday, the 24th day of September, 1878, at 2 o'clock P. M., at the office of the Company, Room 4, second floor, No. 309 California street, San Francisco, California, to adopt a Code of Bylaws for the government of said corporation and its officers.

J. M. BUFFINGTON, Sec'y.

San Francisco, September 9th, 1878.

Telegraph Copper and Silver Mining Com-

pany. Location of principal place of business, City and County of San Francisco, State of California. Location of works, Gopher Mining District, Calaveras County, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 1,) levied on the seventeenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No Certificate.	No. Shares.	Am't.
Howland, W H	Not issued	1350½	$ 40 52
Jones, C C	Not issued	5040	168 20
McCrea, Wm	Not issued	4000	149 97
Bollinger, J C	Not issued	17,106	514 98

And in accordance with law and an order of the Board of Directors, made on the seventeenth day of July, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, Room 2, 528 California street, San Francsico, California, on Monday, the ninth (9th) day of September, 1878, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

I. T. MILLIKEN, Secretary

Office, Room 2, No 528 California street, San Francisco, California.

POSTPONEMENT.—The above sale is postponed to Monday, the 10th day of September, 1878, at same hour and place above mentioned.

By order of the Directors. I. T. MILLIKEN, Sec'y.

Vigorit Powder Company.— Location of

principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee	30	437½	$218 75
Louis McLane, Trustee	32	½ of 875	218 75
G W Grayson, Trustee	62	1312½	656 25
H H Shinn, Trustee	91	400	200 00
H H Shinn, Trustee	92	400	200 00
H H Shinn, Trustee	93	400	200 00
H H Shinn, Trustee	94	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. JAS. W BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

CHARGES.—ASSAYING, $3; TESTING, $2 per metal.

MINING LAWS AND DECISIONS.

Copp'e Hand Book of Mining Laws.

In this little work is given the United States Mining Laws and Instructions. Also, a digest of the decisions under the laws, by the Secretary of the Interior and Commissioner of the General Land Office.

Forms are given for making out notice of location proof of labor, application for survey, and in fact all the blanks a miner needs.

There is also a list of all the mines for which U. S. Patents have been obtained from July, 1866, to August, 1877, with location, township and range.

A handy companion for miners. Price $1, post paid. Address

DEWEY & CO.,
202 Sansome Street, S. F

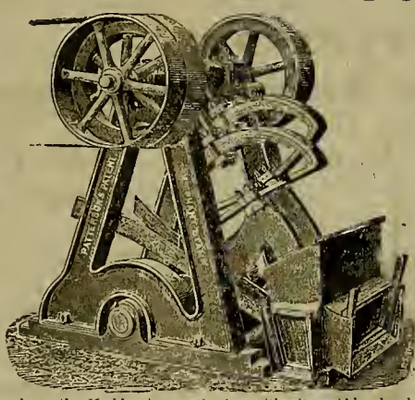
Good Land and Sure Crops.

There has been steady and tolerably rapid advancement made in the growth of a majority of the towns in Colusa, Butte, Tehama and Shasta counties. Especially is this so in the agricultural districts where the land produces at least fair crops in all seasons—wet or dry—as does the land on the Reading Ranch. Those looking for homes in California where diversified farming will pay every year; where wood and water are plenty and easy to be obtained, and other desirable advantages are to be had, should address the proprietor of the Reading Ranch.

Some 14,000 out of 26,000 acres of the grant remain for sale at comparatively low rates, in quantities to suit purchasers, on easy terms. Prices range from $5 to $30 per acre. The tract is between two and three miles wide, with the Northern Division of the C. P. R. R. passing centrally through its entire length. Send postage stamp for an illustrated paper containing information about Shasta County and these lands, to the proprietor of Reading Ranch. EDWARD FRISBIE.

Anderson, Shasta County, Cal.

Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with, the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.]

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

Address, FRASER, CHALMERS & CO., Chicago, Ill.

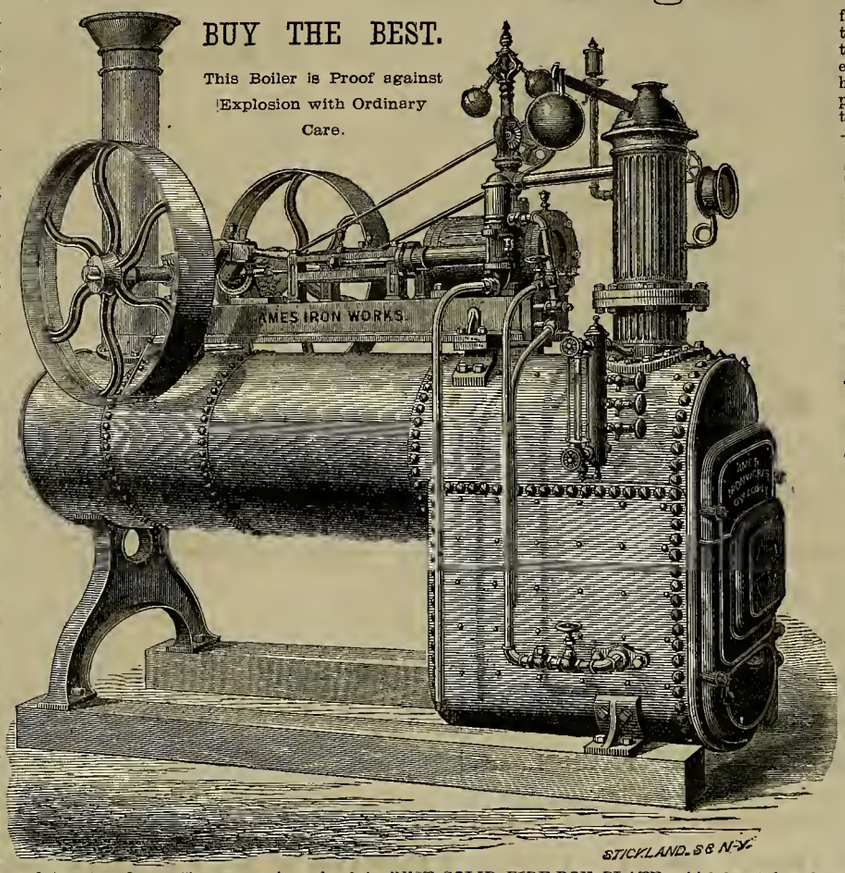
Ames Portable Steam Engine on Skids.

The engine is of the horizontal style, and is made with a bed plate, from entirely new and improved patterns, designed with a view to elegance, simplicity, convenience and strength. It is built entirely separate from and independent of the boiler, and can at any time be used as a stationary by obtaining the necessary additional length of steam and exhaust pipes. In our portables it is placed on the saddles on the top of the boiler, and secured with bolts.

Particular attention is paid to boring the Cylinder accurate and smooth, and to fitting the Piston and Valve. The Piston is of the most approved locomotive pattern, fitted with metallic packing rings, which are adjusted by steel springs of proper proportion, regarding tension, elasticity and strength.

The Side Valve and its face are made perfectly true and steam tight, and it is constructed with the proper amount of lap to develop the most approved data of expansion that has been proved by numerous experiments to point the correct working of the engine, in relation to the use of steam, with greatest economy and efficiency.

This cut, taken from the "pump side" of No. 2 Ames Portable Engine, gives a good idea of the appearance of the size from five to 20 horse-power. Trusting that it will convey a favorable impression as to the style of our engines, we would say as to material, that we use only the best; as to workmanship, that we do not claim any extra polish for external show, but do claim accurate and fine finish to all the working or wearing parts; we also claim that the boiler, steam and exhaust passages, and other vital points, are scientifically proportioned in accordance with the best experience and the use of the Steam Engine Indicator; also, that as we make a specialty of Portable Engines, we can sell a better and larger engine for less money than those who do not confine themselves to any particular article of manufacture. We will not attempt in this space to enumerate the uses to which our engines have been applied, but assert that no engine surpasses them in adaptability to any work or location.



☞ Send for Illustrated and descriptive catalogue.

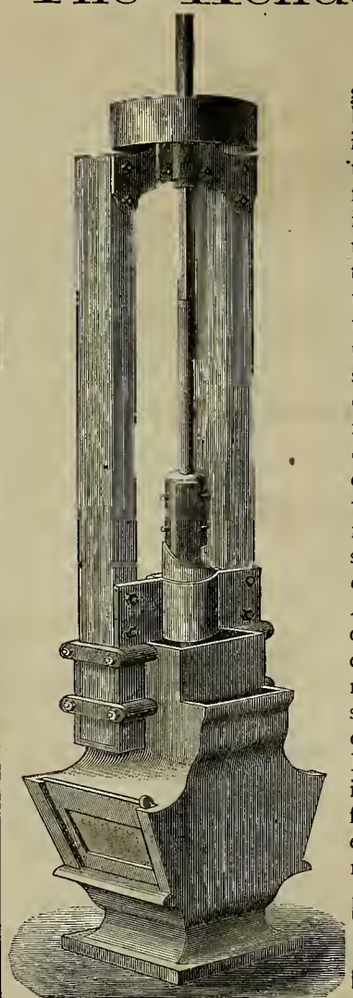
The Kendall Battery.

STEPHEN KENDALL, Patentee.



This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 21, 1878.

VOLUME XXXVII Number 12.

Mining Machinery and Portable Engines.

Messrs. Reynolds, Rix & Co., 18 and 20 Fremont street, exhibited at the late Mechanics' Fair several of the articles of which they are agents, or of which they are manufacturers. Among them were the Ingersoll rock drills, the "dry air compressor," the miners' and builders' horse-power, and the King engine and boiler. The Ingersoll rock drill is no new thing, having been in use here and elsewhere for many years, during which time its efficiency and economy has been practically demonstrated. The drills are made of different sizes and for different kinds of work, and are largely in use on the Comstock lods, Sutro tunnel, and many mines at various parts on this coast, as well as in railroad and mining operations in the Eastern States and elsewhere.

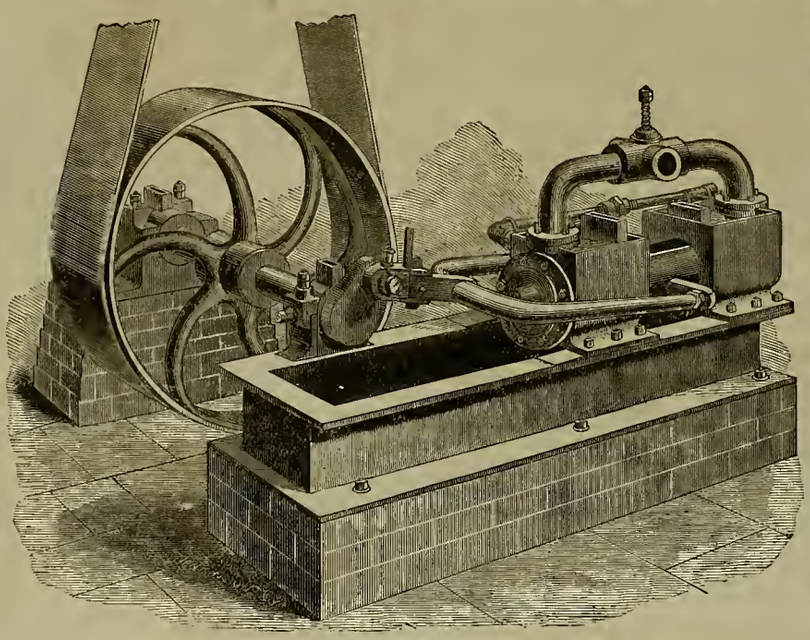
The firm manufactures an improved high-speed, dry air compressor, which is made on a new and very compact form. It is intended for driving rock drills, transmitting messages, forcing sand blasts, and general pneumatic purposes. Engravings of this compressor are shown on this page. In the sectional view, *N* is the cylinder; *J*, the plunger piston; *G*, outlet valve; *c*, coiled spring; *D*, air outlet; *f*, free air outlet; *g*, center for attached forked rod; *H*, enlargement of outlet valve; *I*, outlet valve in center of piston with stem surrounded by coiled spring; *C*, water jacket.

The perspective view, Fig. 1, represents compressor for water-power; Fig. 2 represents a section of compressing cylinders. Motion is imparted to a forked rod which is attached to the center, *g*, of the plunger pistons, *J*, in such a way that facility is afforded for the adjustment of said pistons relatively to the discharge valves of the compressor, in order to meet disturbances consequent on wear and for tightening up the driving connections.

It will be observed from the section, Fig. 2, that there is in reality but one piston, each end of which works in a separate compression cylinder. Each end is tightly packed, and in each end-face is a valve, the stem of which is surrounded by a coiled spring, *I*. At the compressing end of each cylinder is an enlargement, *H*, formed by the extension of the cylinder. This is constructed to form a seat for the outlet valve, *G*, which is held up to the shoulder by the spring, *e*, which surrounds its stem. At *d* is the air outlet.

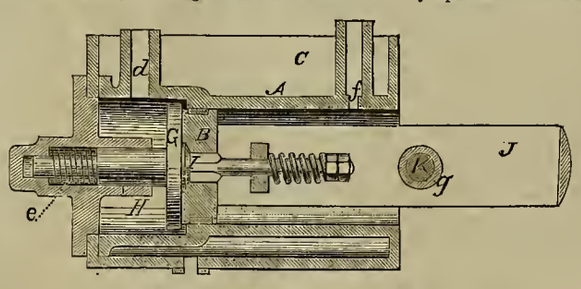
When the piston makes an inward stroke, its valve, *I*, of course closes, and the air is compressed before the piston and against the valve, *G*. As soon as the pressure of the latter exceeds the oppositely acting pressure of its spring, the valve opens; and all the compressed air then escapes through the outlet, *d*. As soon, however, as the pressure is sufficiently reduced, the valve spring reacts, and as the piston at the end of its path projects for about one-sixteenth of an inch into the enlarged portion, the valve comes back directly against it, and follows it until once more forming a flush joint with the shoulder. Meanwhile, the valve in the piston opens, and air enters between the same and the valve, the piston continuing its rearward stroke until past the orifice, *f*, which opens directly into the air, and thus a full supply is insured ahead of the piston, before it begins another compressing stroke. Of course the reverse operation is going on in the opposite cylinder, and in this way the action is rendered continuous.

It will be noticed that there is not only an absence of ports and passages, but that no water whatever is used in the air cylinder; so that the danger of wear from gritty particles in the same is entirely obviated. The water necessary for cooling is applied only on the outside in the jacket, C. Any kind of water may be used without injury to the compressor. As the area of opening in the inlet and outlet valves are very large, they require but a slight motion to admit or release the air, consequently the machines may be run at a high rate of speed, from 175 to 200 revolutions; and are made light in weight when compared with the amount of work they are capable of performing. By this construction and combination, not only is a free or full discharge obtained, and the entire volume of compressed air expelled from the cylinder, but whenever it is necessary to gain access to the outlet valves, which overlaps the working portion of the cylinder, or to remove and replace said valves, the same can readily be done by removing the end covers of the cylinder, and without breaking the joints in the connection, which carry off the compressed air from the enlarged chamber at the closed end of the cylinder. By referring to the section through the center of one of the air cylinders given above, it will be observed there are no ports or passages, and the compression of air must be absolutely perfect. These compressors are made to be run by water power or steam.



IMPROVED HIGH SPEED DRY AIR COMPRESSOR.

The miners' and builders' horse power is another article manufactured by Reynolds, Rix & Co., which we recently illustrated and described in the PRESS. It is quite simple, though combining the following requirements, viz: Power to hoist, a brake to hold at any point, or regulate it when lowering so as to lower at any speed, and means to stop the motion instantly at any desired point. It is completely under the control of the man in charge. It is built mainly of wrought iron, and



SECTION OF AIR COMPRESSOR.

is thus made with a view to secure the lightest weight compatible with necessary strength. The drum will wind five or six feet of wire rope, capable of a working strain of 1,500 pounds, without lapping or covering to exceed 14 inches of drum surface.

The King portable engine and boiler is for use in all industries where small engines are required. It is simple, compact and strong. The tubes in the boiler are arranged so that the maximum of heat is obtained from the minimum of fuel. So carefully is every unit of heat used, that the paint on the top of the boiler has never been known to scorch. It is said to be as safe as an ordinary stove, and may be moved about with equal facility, being provided with castor. The engine is separated from the boiler so that its moving parts cannot be affected by the heat. It possesses all the advantages arising from a vertical position. The exhaust steam is employed in a feed water heater of original construction, and then allowed to escape in such a manner as to furnish draft for the furnace. All the bearings are adjustable. An arrangement for carrying away all drip is attached Each engine is furnished with a Judson governor. In short, besides its own peculiar advantages of economy, portability, etc., it possesses all the requirements of any first-class engine.

MINERS' PROTECTIVE UNION.—The miners in the neighborhood of Angels, Calaveras county, organized last month an association bearing the above name. They claim that large tracts of mineral land are now being located under agricultural titles by speculators. These speculators, it is held, obtain the lands by false representations, their object being not to make agricultural homes for themselves, but to monopolize as many valuable acres as possible. The aim of this society is to watch the new locations made, and see to it that the land concerned is rightly described by the locators.

ALL sheep entering Victoria, Australia, are to be quarantined 21 days and dipped three times.

The Mines and the Courts.

Judge Daingerfield has sustained the demurrer of the defendant in the case of John H. Burke who sued for himself and all other stockholders of the Con. Virginia M. Co. *vs.* J. C. Flood *et als.* This suit is for an accounting relative to all the transactions of the several defendants who are named in the bill—and who have dealt with the Con. Virginia M. Co.

The allegations were that at certain specified dates, certain of the defendants named were stockholders and directors of that mining company, and that being such stockholders and directors, they conspired with certain other persons, also directors of different business enterprises, in which the aforesaid stockholders and directors were also interested, to trade with the Virginia Consolidated gold mining company, and that in so doing they made a profit out of the mining company. There was no allegation in the complaint of *actual* fraud in the transactions, or any of them, the nearest approach thereto being that the property sold from the one corporation or individual to the other was at an advance on the cost to the seller.

The Judge sustained the demurrer on the ground that the different causes of action joined in the complaint did not affect all the parties to the action. He thought that if the plaintiff could indeed recover without allegation of fraud in fact, he might do so by making separate cases for each set of defendants. The Judge went on to say: But it is by no means clear to my mind that such transactions as those mentioned in the complaint are *absolutely* void. Take, for instance, the allegation in references to the crushing of the ore taken from the company's mines. The allegation is that the Con. Virginia M. Co. had their ore crushed at a cost of $1.03 per ton, and that the expense of such milling was only $6, and that when that was done the Con. Virginia M. Co. had money enough to build its own mills and crush its own ore. There is no allegation that any one else offered to crush the ore for less, or that the stockholders or directors were willing that the Company's money should be appropriated in the building of mills and the reduction of ores. It would seem to me that very many of the enterprises of the country would be entirely checked, if under no circumstances the private fortune of individuals could be aggregated, and industries established looking for remuneration to other corporations with which the promoters happened to be identified as trustees or directors.

Some of the earlier decisions would seem to countenance the view contended for by plaintiff's counsel, but I doubt if our Civil Code intended to establish any other rule than that such contracts are voidable merely, and that they will be set aside by Courts of equity in the absence of the most perfect good faith.

BULLION SHIPMENTS.—Manhattan, Sept. 10th, $11,700; Standard, Sept. 9th, $25,139.50; McCracken Con., Sept. 11th, $8,158.06; 18th, $6,872.71; Northern Bells, Sept. 9th, $4,121.69; 11th, $4,151.58; Sept. 14th, $5,930.34; Independence, Sept. 9th, $9,984.67; Leopard, Sept. 9th, $9,101.46; Tybo Con., Sept. 9th, $8,373.78; 13th, $7,981.39; Extra, Sept. 16th, $3,525.17; California, Sept. 14th, $80,291.07; Con. Virginia, Sept. 14th, $52,205.03; Pittsburg, Sept. 14th, $2,153; Hillside, Sept. 17th, $6,300; total to date, $12,500; Ontario, total, for August $138,670; total for Sept. to 13th $54,012; Christy, Sept. 16th, $4,966.

THE Paris School of Mines and the Jardin de Plantes, both contend for Hank's duplicate collection of California minerals. Our Commissioner will leave them "to France" simply.

THE proprietors of all the steel and iron industries in and around Philadelphia, are contemplating a reduction of wages to their employies. The cause, competition.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Legitimate Mining.

EDITORS PRESS:—When men mean business and not mere spsculation, it becomes a pleasant task to give some account of their operations. The following, all business men, with one excsption, of San Jose and vicinity, viz., H. Phslps, John Barry, M. Corcoran, Wm. Quinn, W. H. Hale, J. M. Thorpe, P. W. Reardon, J. T. Burkett, J. T. Pearl, and H. M. Herbert, of Prescott, Arizona, have recently formed a corporation known as the

Hayes G. & S. M. Co.,

Witb principal place of business at San Jose, for the purpose of mining in Arizona. Mr. Henry Phelps, present County Assessor, is the President. The capital stock is divided into 120,000 shares, of which 30,000 have been eet apart for a reserve fund and a working capital. The larger portion of 5,000 shares put upon the market has already been taken in and around San Jose. The ledge is silver-bearing and is situated on the Santa Maria river, 30 miles from Cullins' Station on the Ehrenberg and Prescott road.

A perpendicular shaft has been sunk to the depth of 55 feet, striking the ledge, which ehowe at the bottom a width of over four feet; the foot-wall not yet reached. It is repreeented to crop out boldly at many points for several miles.

The ore ie spoken of as the class known as free-milling, a few tons from the surface having, eame time since, been worked by mill process. Little is definitely known as to the results of this crushing. This much, I understand, is known. It gave a handsome margin after paying heavy transportation and all other charges. Numerous assays have been made. The first by E. Stahl, of Prescott, gave $377 per ton in eilver; the second, Messrs. Blake & Co., of the same place, $568.65; and the third, by Father Cichi, Professor of Chemistry at Santa Clara College, $394.43.

The following encouraging extract is from a letter of Mr. J. W. Clarke, of July 19th, 1878: "I have had several assays made of the rock. The lowest was $16, the next class $87.50, and the high grade went from $1,500 to $1,800. Mr. Blake, the assayer, took an average of the rock I brought from this mine, making his own selection. This went $1,222 per ton. The company design to extract 1,000 tons, have the ore accurately sampled and assayed, when a mill will be erected." A. C. K.

Hollisteria—A New Genus of Plants.

EDITORS PRESS:—The discovery of uew genera of plants, as the country is being more and more explored by sharp-eyed botanists, is not so common but what I may be pardoned for what follows:

I have the pleasure to announce that a plant found in Cholame valley, in the southeast corner of Monterey county, July 8th, and by me supposed to be an undescribed species, proves, upon sending to Dr. Gray, to be the type of a new genus. "Curious, beautiful and a good genus," Dr. Gray states.

The species by which the new genus is repreeented ie a pretty, white-wooly, yellow-flowered, sparsely-prickly plant, spreading flat upon the ground on a warm, sandy slope. The genus belongs to the *Eriogonæ* section of the order of *Polygonaceæ*, all sand and sun-loving plants, some of them of much beauty.

At my request the new genus has been named *Hollisteria*, and dedicated by Gray and Watson to Col. W. W. Hollister, of Santa Barbara, in recognition of his distinguished patronage of science. The specific name *lanata* is given on account of the wooly appearance of the present species, *lana* being Latin for wool.

J. G. LEMMON.

Yosemite, September 1et, 1878.

FERRO CHROME.—Chromium augmente the hardness and tensile resistance of iron alloys; but it has no "steelifying" properties, and cannot take the place of carbon. Boussingault fused chromic oxide with cast iron in such proportions as to burn all the carbon of the latter with the oxygen of the former; but the non-carboniferous alloy of iron and chromium thus obtained would not temper. Berthier is the real discoverer of chromized steel, or ferro chrome. It is manufactured in Brooklyn from Baltimore chromite, as follows: The pulverized ore, mixed with charcoal dust, is fused with a euitable flux, in graphite crucibles, to obtain a white chromium alloy, corresponding to that of Berthier, and called ferro chrome, after the analogy of ferro manganese. Chrome steel is as yet but little known, and is much restricted in its applications.—*Engineering and Mining Journal.*

Melville Attwood, in his paper read before the California Geological Society, states that our California iron ores, particularly magnetite, are well adapted for the manufacture of mining machinery, moce especially ore crushers. May uot our chrome ores play an important part, as the application of ferro chrome becomes more extensive?

New Mining Camps.

Lodi, Downeyville and Grantsville.

We had a conversation this week with a gentleman wsll verssd in mining matters, who has just returned from a very interesting trip into a comparatively new and unknown mining region. We give the rssult of our iuterview in our informant's own words. The country visited includes the three new and rising camps of Lodi, Downsyville and Grautsville. Neither of these places had an existence until a year or two ago; hut the discovery and opening of a good mine at each place has caused the formation of the three camps.

The first things in which your readers will be interested are the locations of the new districts, and the means of reaching them. They are situated within ten or twenty miles of each other, and within a few miles of the Reese river. A tri-weekly line of stages runs from Wadsworth, reacbing Downeyville in two days (distance a littlo over 100 miles). Either of the other places can be conveniently reached next morning, Lodi lying to the north, about ten miles by the road, Grantsville to the east, about twenty miles by the road. There are other camps in the neighborhood—such as Ellsworth and Ione, but they are on the decline.

The road traveled from Wadsworth runs rather to the south of east, over the regulation Nevada eage-brush desert, interspersed with occasional pleasant alkali flats, over one of which I had a nice moonlight walk of about eight miles, ankle-deep in mud at every step. The occasion of the aforesaid ramhle was the sinking of the stage in mud, beyond the power of the horses to extricate.

One might judge from this little adventure that the roads are generally bad; but such is far from being the case. Excepting immediately after heavy rains the flats furnish excellent traveling, and the road is almost level from Wadsworth to Downeyville. Indeed, so good are the roads in general, that one mine—the Alexander, at Grantsville—is now shipping extraordinarily heavy machinery, the teamsters taking it from Wadsworth to Grantsville for 2½ cents per pound, which, by the way, is the regular rate of slow freight. I may here state that the fare by etage to Downeyville is $20, and to Grantsville $25.

Downeyville, the first place of importanco, is a lively camp, contaiuing perhaps a couple of hundred men, and about thirty buildings; mostly, of course, log cabins, constructed miner-fashion, though some of the aristocrats indulge in the luxury of houses built of regular lumber. The place has great expectations—so great that the new-comer, unless he has friends and acquaintances, must sleep in the sage-brush, house-room being too valuahle to be wasted in furnishing lodgings.

In my judgment, however, the prospects of the place do not warrant so great a rush, for there is hut one good mine there; and although there may he undoubtedly more discoveries in the vicinity, yet the number who will "strike it rich" will he but a small percentage of the seekers.

The One Good Mine,

However, is one of the few which poor men can manage, and by which they can raise themselves to wealth without the necessity of begging from incredulous and selfish capitalists. It is called the Carbonate Point Consolidated, or more familiarly, the Downey mine, from the fact that it is owned by the Downey brothers, the original discoverers. Its history is euough to give encouragement to the disheartened prospector, who has so often seen other men grow rich from the results of his labors.

Less than two years ago one of the Downeys then prospecting in Cottonwood canyon, about five miles to the south of there, rode over this hill in one of his journeys for supplies. For years a stage road had run at the foot of the hill, and no one had ever thought of looking there for a mine. But he saw a small piece of ore, and a little prospecting showed more of the same kind. They removed their camp to this hill and went to work. They were poor; had to obtain credit for everything. But they had will and muscle, and went on.

Every mining man knows that a furnace can he obtained for but little money, while a mill is a costly affair. Hence a mine whose ore will smelt is a poor man's bonanza. Here was the secret of their success. The ore was an argentiferous galena, easily smelted. They brought it to the surface and stacked up ton after ton. The ore on the dump rendered their credit good, and they now have a furnace runningand reducing about 25 tons per day. The fact that the prospector has actually reaped the harvest, instead of being obliged to haud it over to the capitalist, is the cause of the rush to Downeyville.

Geology of the District.

The present of the Downey mine is assured. Its future is not so certain. It consists of a series of parallel veins in a limestone formation, dipping at an angle of perhaps 45° at the surface, hut soon flatteuing to half that iuclination. Some 12 inclines have been suuk on different veins, the deepest being about 250 feet. The ore veins follow the plane of stratification of the limestone. The hackbone of the country is an axis of upheaved and fractured granits, running iu a north and south dirccticn, and passing a short distance to the east of the Downey mine. The granite cannot be seen here, nothing but the supsrimposed limestone being visible. But a short distance to the south, a canyon presents a fins section of the country. Here the fractured granite is seen forming an anticlinal axis, with the limestone strata sloping away on both sides, and above the limestone a heavy slate formation. To my mind the manner in which the Downey mine was formed is clear. A series of fissures were caused by the tilting of tbe strata, and thess were subsequently filled with ore.

Now, as ths ore bodies follow the plane of etratification of the limestone, their depth manifestly depends on the distance to which the strata were separated by the upheaval. Experience has not shown that these hlankets hold to great depth, although they are frequently worked for years, and to great profit, owing to the proximity of the ore to the surface.

The next point of interest ie

Grantsville.

Here we meet an entirely different state of things from that at Downieville. The place is flourishing, owing to the fact that they have had a regular pay day from the start. Accommodations are good, and one feels that he has reached civilization agaiu. We have here no romantic story of how the honest miner has raised himself from poverty to wealth by pluck and industry, for the mines here are owned by men of means, prominent among whom is J. B. Cooper, of San Francisco. Still, these mines have a history, and an instructive history. A year ago Grantsville did not exist. True, there was a tunnel in the hill, and perhaps the remains of a deserted camp. But the gentlemen who now own both mines and town determined that a 50-foot vein ought to pay, even if the ore was low grade, and especially where fuel and water were so near at hand, and the ore close to the surface, worked by tunnel instead of by shaft. They went at the work and the result is a bandsomely paying property, even with the low-grade ore. But the ore is not all low grade. The south end of the mine carries a fine body of high-grade ore; ore that will average over $100 per ton.

I cannot give details of tbe formation of the country around Grantsville. I wae there only four days, and those four days were, hy request of the owners, spent underground, endeavoring to get a correct idea of the extent and value of the principal mines. But, though my examination in this respect was not thorough, I am satisfied that the Grantsville ledge is a contact vein, one side being in hard unstratified limestone, and the other in quartzite and porphyry.

The vein, as I have said, is very largo, with heavy clay walls. Where cut by the tunnel, the ore is low grade, say $50-rock on the average. Its beauty, however, lies in the fact that it is all ore, with very little waste; and this holds true in the upraise, clear to the eurface, as well as in the lower levels. I have already eaid that the south drift on the second level bas developed a large body of high-grade ore. This drift is 160 feet in length, and is being crosscut, to find the width of thc vein at this point. A winze also extende down about 70 feet from this level, in the foot-wall of the vein, and the cross-cut from the bottom of this winze is likewise in high-grade rock. The ohject of the winze is not only to develop the mine, but also to connect with a lower tunnel, which is being run from the base of the hill, and was, at the time of my visit, in a distance of 410 feet.

The Mill,

Which is now being built at tbo Miners' foundry, in San Francisco, will stand at the moutb of this tunnel. It will he at first a mill of 20 850-pound stamps, with pans and settlers, of course, and with two furnaces for roasting the ore. It will be run by a 20x48 engine, so that 20 more stamps can be added at any time.

Here I may mention a fact of interest to mill men. The ore of this mine contains no sulphur, so that it would naturally be considered a free milling ore, and so it is. It yielde a good percentage when worked raw. But it carries considerable lead, one of my assays, an exceptionally rich one, giving nearly 15%. Now, every mill man knows that where mercury takes up lead, it becomes more or less indifferent to silver. By roasting, however, the lead is oxydized, eo that mercury will not take it up. Hence, in this manner they obtain both a larger yield and a finer bullion. Moral: Thorough working pays.

They have not yet reached water in this mine. The lower tunuel is cxpscted to cut the vein at about the water level. When they reach this point they will find roasting furnaces not only useful, hut iudispeusable, for this vein has undoubtedly at some former time beeu charged with sulphur. The portion ahove the water level has lost its sulphur by the action of air and surface water, so that they are now working in decomposed rock, nature having done part of the roasting for them. When they strike water all this will change, the sulphurets will be found in their original condition and roasting will be a prime necessity. They are now hauling the ore 10 miles to a custom mill and are paying a round price for having it crushed. Still they are making a handsome profit. They anticipate great things when their own mill shall stand at the tunnel's mouth, when they can chute down the ore from the upper levels and run it direct to the mill. And I must say, I think their anticipations well founded.

This is the priucipal mine of Grantsville. It is called, in the sxpressive language of "the boys," the American Roostsr. In San Francisco they have adopted for it the more civilized name of Alexander, Mr. Cooper, to whom I have already referred, having named it aftsr his son.

Since my return I have seen an article in ths PRESS from ths pen of the State Mineralogist of Nevada, in which he gives a glowing account of the wealth of the Alexander mine. Now, the Alexander is certainly a first-class property, and will pay handsomely for years to come. But in my judgment no mine ever existed which could be calculated on for a yield of "millions of tons of ore." It may yield millions of tons with further development, but my estimate of it at present is as follows: Ore in the mine, from present lowest workings to surface, 150,000 tons; cost of mining and milling, $15 per ton; average profit, $30 per ton. This is sufficient to yield a handsome profit for the next five years, and ie the largest number of tons I have ever been able to report existing in any mine; but there is a vast difference between our figures.

And now for the

Instructive Portion of the Mine's History.

I mentioned that there was an old tunuel half way up the hill. Thie tunnel cut completely across the vein and ran into the hill beyond. Connected with it were upraises and winzes, and some stoping had been done by the original owners. They made up their minde that there was no great honanza there and ahandoned it. They were New Yorkers and wanted very rich ore. They knew nothing about mines, but had exalted ideas of the golden West. Now mining men have come along, taken up what they rejected and are making it pay. And after October, when the mill will strike its first blow, they are calculatiug on showing the New Yorkers what handsome returns they can get from this rejected property. The moral I wished to draw from all this is that people should learn mining before they go into it, aud never undertake a business they know nothing about.

The third place of which I intended to speak is

Lodi, and the Illinois Mine,

By means of which Col. Raymond ie seeking to retrieve himself. But I suppose most of your readers are more or less familiar with the history and prospects of this mine; for it is far better known than either of the others. The main difficulty here was in the smelting of the ore. This has, I believe, now been overcome, and the furnace is running far better than before. All who know "Uncle Billy" will sincerely wish him success.

In conclusion, there are one or two other points on which your readers will naturally look to you for informatiou.

Chances in the New Regions.

First, what are the chancee of finding new mines in these regions, and of what character are they likely to be? I would say in reply, that I think the chances good on both sides of the divide. On the west side, where the Downcy and Raymond are located, I should look for smelting mines. But I should advise prospectors to direct their attention some miles south of the closely prospected portion. As one goes south, timber becomes more ahundant. Water is ecarce throughout this section, but springs are found in tbe canyone, which eupply enough for the wants of the miners. (No one not familiar with the working of mines, knows how greatly their value is enhanced by the close proximity of fuel.) Still, men might do well in the vicinity of Grantsville. Tbe prospect of large aud permanent bodies of ore is better on that side than on the otber. But from what I have seen of the country, I should judge that it would be milling and not smelting ore. There will be one advantage to prospectors in that neighborhood. In October, when the "Alexander" starts its own machinery, the mill at Ione will bo glad to work ore for all comers; and this may be a help to men who have good properties there, but lack the money to put up their own machinery.

Second, what are the chances for commercial business in these places? As to this, the field is pretty well occupied. Certain special lines of business might succeed. A restaurant ie wanted in Downeyville. There was talk of putting up a lodging-house there. If this is not done, there is a good field in that matter. But there are stores in abundance throughout this region—plenty to eupply the wants of all.

SCHLIEMANN'S DISCOVERIES.—Dr. Schliemann is at Constantinople, and intends resuming his excavations in the Troad if he can obtain from the Porte 50 soldiers as a guard against robbers. A summary account of the German excavatione ot Olympia says that the number of marhle objects found during the last three winters is 904; of bronze, 3,734; of terra-cottas, 904; of inscriptions, 429; and of coins, 1,270. All the more important ruins have been photographed, and the third volume of the official account is about to appear. An exhibition of all the casts taken will shortly be opened at Berlin.

HARD GLASS IN LABORATORIES.—A. Lamek (*Polyt Notizblatt*) warns chemists against the use of beakers, alembies and other articles made of "hard glass." He was filtering a solution of phosphate of lime into a half-litre glass, when it suddenly exploded, without any perceptible cause. He had not heated the glass, neither was there any shock or change of temperature, but the glase was "shivered into a million fragments," and he was wounded in the back.

MECHANICAL PROGRESS.

The Care of Shop Tools.

The *American Machinist* has some important suggestions concerning the advantage of care and system in the treatment of shop tools. First cost of tools seldom represents their ultimate cost, whether it becomes necessary to repair them or not. If a good mechanic makes a tool last a year in constant usage, while his careless neighbor uses up one of the same kind in six months, the cost of the latter should be accounted twice that of the former. When repairs are made their value must be added in computing the whole cost of the tool.

One primary reason why some shops can show a greater profit on a given amount of work is because they get more service out of their tools. This is just as evident when tools are cheap as when they are dear, for the products of mechanical labor fluctuate the same as the first cost of tools; and if a large part of the income of business goes for working tools and repairs to the same, balances on the right side of the ledger are likely to be diminutive, if indeed they appear at all. It is the first requisite that tools and machines should be adapted to the work to be performed. Fine tools should not be used on heavy, coarse work. They must also be kept in good working order, cutting edges well sharpened and bearing surfaces lubricated, shafting kept well aligned, pulleys balanced, belts kept clean and pliable and at the correct tension, rust prevented, emery wheels and grindstones trued up and dirt kept out of all wearing parts.

Machines should be mounted on stable foundations and run neither above nor below the proper speed required to do the work. Small tools demand as much care as large ones, and a careless or inexperienced workman will often spoil more than the amount of his wages in files, drills, chucks, reamers, taps, dies, calipers, wrenches and the like, unless closely looked after by the master mechanic. It is therefore very essential, in order to insure proper care of tools, that workmen know just how to use them. All small tools should be laid away systematically in a dry place when not in use. In large shops a room should be set apart for this purpose, and a man detailed to take charge of it and keep the tools in good working order. There is no part of a large machine shop from which an outsider can form a better judgment of the general management than by an observation of the tool room. The best economy is established by securing none but the best tools at the outset, for in the long run they will be found the cheapest. As a rule it is expensive trying experiments by purchasing tools of new and untried patterns or material. New machines and tools are often constructed so as to leave no reasonable doubt of their successful operation, but this is not invariably the case. It is always safe to buy those about the working of which there is no doubt. Second-hand machinery can often be obtained in good order at very low prices, if the purchaser has extra time at his disposal to look it up, but when machinery is much worn, its value is questionable at any price. It is not only easier, but a greater satisfaction, to take care of good tools than of poor ones.

CALCULATING MACHINES.—In his address on the science of mathematics, from which we quoted a paragraph last week, Mr. Spottiswood made allusion to calculating machines. The idea of substituting mechanical for intellectual power has not long laid dormant, for, besides the arithmetical machines whose name is legion, from Napier's bones to Earl Stanhope's calculator, and the Schultz and Thomas machines, now in actual use, Prof. James Thompson has recently constructed a machine which, by means of the mere friction of a disk, a cylinder and a ball is capable of effecting a variety of complicated calculations which occur in the highest application of mathematics to physical problems. By its aid an unskilled laborer may perform the work of ten skilled arithmeticians. The machine is applicable alike to the calculation of tidal, of magnetic, of meteorological, and perhaps also of all other periodic phenomena. It will solve the different equations of the second and perhaps of even higher orders, and through the same invention the problem of finding the free motions of any number of mutually attractive particles, unrestricted by any of the approximate suppositions required in the treatment of the lunar and planetary theories, is reduced to the simple process of turning a handle.

AIR-BRAKE ON FREIGHT TRAINS.—The air-brake has been successfully tried on a freight train at the Veta pass, on the Denver & Rio Grande railway. On a down grade of 211 feet to the mile the experiment was made with a train of 12 flat cars, loaded with green lumber and weighing nearly 200 tons. The train was running at a good rate of speed, but by the application of the brakes was stopped short in a distance of 440 feet in 22 seconds, and with the throttle of the engine wide open. The air at the Veta pass only sustains a column of mercury of 21 inches, so that the pumps of the brake had to compress the air through 9-30ths of the strike to get air of the same density as the pumps take in the sea level.

Retarded Fracture in Tool Steel.

A paper was read before the late meeting of the American Society for the advancement of Science, by Wm. Kent, describing a peculiar case of fracture in tool steel. From this paper, as printed in the *American Manufacturer*, we take the following paragraphs: Mr. John L. Gill, Jr., of the Pittsburgh Car Wheel Works, Allegheny City, had occasion to use in a machine which he is building a cylindrical piece of tool steel, 10 inches long, and two inches in diameter, with a curved groove cut on one side and a rectangular groove on the opposite side, parallel to the axis. The steel was procured from a well-known firm, and stated by them to be the very best tool steel. It was supposed to contain about 0.9 % of carbon. That the steel was of excellent quality is shown by the fact that another piece from the same bar was made into a rose reamer, which has been in use for some time in Mr. Gill's shop without showing a flaw. The reamer and the piece which broke were tempered by the same blacksmith, an experienced hand.

After the piece was formed into the required shape, it was tempered by being carefully heated in a wrought-iron muffle, then plunged into water and cooled. It was then oiled, and held close enough to the fire merely to burn off the oil, the object being to have the piece extremely hard. It was then laid away on a shelf, to be used when the machine for which it was made was ready for it. The machine being delayed the piece was not needed as soon as was expected and it lay on the shelf for six weeks. One night, at the end of the six weeks, the watchman of the works heard in the shop a report like a musket shop, and on going toward the shelf on which the steel had been placed and from which the report sounded, he found that the piece had broken in two, one of the broken pieces falling on the brick floor, four feet in front of the shelf, the other having apparently recoiled against the board wall behind the shelf, leaving a deep dent in the board. The fractures are of a peculiar curved or concave and convex form, and the structure shows a fine grained and superior metal.

The various theories of internal strain will at once suggest themselves to those inquiring into the cause of this and similar accidents. It is almost certain that a condition of internal strain existed in the piece of steel during the whole six weeks that it lay on the shelf. It may be possible that the interior portion of the piece during all that time was compressed by the greater contraction of the exterior portion, and that it resisted this compression with a constant and uniform force, while the resistance of the exterior portion to this force gradually diminished, becoming weaker until it "let go" suddenly, and the piece broke with a loud report. Admitting this theory, however, the difficulty arises, "if the exterior portion 'let go,' why did the interior also break, its strain being relieved? The "shock of rupture" may be the answer to this query.

PICKING HOPS BY MACHINERY.—An ingeniously devised labor-saving hop-picking machine has been invented by a Waterville, N. Y., man. The following description is given of it: It consists of two rubber rollers, so constructed as to draw in the branch, while two steel rollers, having an opposite action, pick the hops from it. The machine is about the size of an ordinary clothes-wringer, is propelled by means of a treadle, and runs as easy as a light sewing machine. From the picker the hops run into a sack, which, when filled, is taken to the separator, which sorts the hops from all leaves or stems which may have gone into the sack, and thence to the hop house. It is estimated to pick from 20 to 30 boxes per day, and one separator is ample for a large number of machines. It is stated that the separator is not yet perfected, but works with moderate satisfaction.

ECONOMICAL VALUE OF SOLAR HEAT.—In experimenting with his solar heating apparatus, Mouchot has found that the most satisfactory material for mirrors is either silver or brass, covered with a thin layer of silver by galvanizing. The variations of solar intensity in Algiers, between 8 A. M. and 4 P. M., are generally slight. The quantity of heat gathered on a square meter per minute varies from 6 to 9.8 calories. A supply of seven calories enables a reflector of a meter square to boil in less than 12 minutes a liter of water at 20°, and produces hourly 778 grams or 1,322 liters of steam at the normal pressure. These results are only two-thirds as great as he anticipates from larger receivers. He proposes soon to present to the academy a description of his great receiver of 25 square meters, which is to be placed in the Universal Exposition.

STEEL TOWING LINES.—It appears from Eastern papers that steel tow-lines are becoming popular on the lakes. The Cleveland *Plaindealer*, in a recent issue, says. The steamer *Chamberlain* has had one during the season and found it to work well. Yesterday the propeller *Egyptian*, with her consort, the *Pelican*, left for Marquette, towing with a steel line. It is 660 feet long and weighs less than 800 pounds; is made of the best crucible steel, at the same factory that supplies the British navy. It left Liverpool 16 days ago, was imported and fitted by Messrs. Upson, Walton & Co. for the owner, Mr. R. K. Winslow, and is now on its way to Lake Superior. This may be considered quick work.

SCIENTIFIC PROGRESS.

Prof. Huxley and Anthropology.

At the recent meeting of the British Association we notice that Prof. Huxley gave a new statement concerning his belief of the age of mankind on this planet. He said: The greatest progress of our knowledge of man is the introduction of man in a fossil state. When any man broached the notion of a fossil man he would be laughed at. It was contrary to any of the preconceived ideas that man could have existed in a fossil state. That idea fixed itself so strongly on men's minds that they thought their eyes the plainest evidence. We have a most astonishing accumulation of evidence of the existence of man in ages antecedent to this. What the exact data is I do not think any one can say. It is beyond all question that man existed at a time when the whole physical conformation of the country was different to what it is now. Whether the evidence we have justifies in going backward still is beyond that question. That question would be regarded as something startling. But when it comes to a question of tracing back men further than that, I must confess that the evidence is to my mind of a very dubious character. We have not at present any positive knowledge on the subject. Then comes a very interesting question, whether with such evidence of the existence of man before us, it is possible to trace in that history any evidence of the human type essentially similar to that which exists at the present day. I am free to confess that my opinion on that matter remains exactly what it was some 18 years ago.

I did venture to put forth the opinion that what is common to all such human remains is that they present a most marked and definite trace of what are called the characteristics of a lower type. I must confess that the arguments brought forward to show that the skull is an abnormal skull have no weight whatever with me. From the remains that accompanied the skull of that human being, I must say that so far as all the fundamental points are concerned, they are the same as those of men of the present day, and that that being could wear boots just as well as we. I do not know that there is any more reason for believing that the man who existed in that day could not have been in all respects similar to the man of the present day, than to object to the evidence that the horse which existed in that day was in all respects identical with the horse of the present day. We know that the horse presents a series of modifications and evolutions by which he could be traced back, and it would be just possible to trace back man in the same way.

THE BOTTOM OF THE OCEAN.—At the late meeting of the British Association, Sir Wyville Thompson, of the famous *Challenger* expedition, made the following remarks: 'The average depth of the ocean is 2,000 fms., and it nowhere exceeds 5,000 fms. Within 300 or 400 miles of the shore formations are being laid down, derived mainly from the disintegration of shore rocks; but in the abyssal regions the sounding instrument brings up an extremely fine reddish clay, in great part amorphous, but containing, when examined under the microscope, a quantity of distinctly recognizable particles, organic and inorganic. The organic particles are chiefly siliceous, and for the most part the shells or spines of radiolarians, which are living abundantly on the surface of the sea, and apparently in more or less abundance at all depths. The inorganic particles are minute flakes of disintegrated pumice, and small crystalline fragments of volcanic minerals; the amorphous residue is probably principally due to the decomposition of volcanic products, and partly to the ultimate inorganic residue of decomposed organisms. There is ample evidence that this abyssal deposit is taking place with extreme slowness. The sharks' teeth brought up are of an extinct species. So far as we know, the deposit being formed at extreme depths in the ocean does not correspond either in structure or chemical composition with any known geological formation. During past geological changes it is probable that the abyssal beds have never been exposed.

OXYGEN IN SILVER.—Dumas has published in the *Comptes Rendus* some recent researches on the amounts of oxygen in metallic silver. A kilogram of pure silver developed in heating from 932 to 1132 degrees, 57 cubic centimetres of oxygen. If the silver was melted for 15 minutes with saltpetre and exposed to air, one kilometre yielded 158 and 175 cubic centimetres of oxygen. Dumas draws attention to the fact that in estimating the equivalent weights those chemists who granulated the metallic silver with an access of air, after melting with an addition of borax and saltpetre, necessarily obtained silver holding oxygen. This makes the proportion of silver to chlorine 108 to 35.50, instead of 108 to 35.47, as determined by Stass.

TRIUMPH FOR AMERICAN MICROSCOPES.—A signal triumph has been won by American scientific instrument makers at the Paris exhibition. Charles A. Spencer, of Geneva, New York, the manufacturer of the Hamilton College telescope, has received a gold medal at the Paris Exposition for his display of microscopic and telescopic lenses and fixtures. This is no small honor, when we consider the competition that naturally came from famous European manufacturers.

UNDERGROUND TEMPERATURES. — At the meeting of the British Association a report was read from the committee on underground temperatures. It described a series of interesting experiments, by which it was shown that the heat increased progressively, according to the depth beneath the surface of the earth, that the planes of heat were parallel when the surface of the earth was level but covered beneath the surface of high mountains. Having alluded to the great difficulties they experienced in finding the temperature of bore holes filled with water on account of the fluctuations of the heated water from the bottom, and the consequent disturbance of temperature, Prof. Everett described a new system for making observations in closed up bores by a thermo-electric method. Two wires, one of iron and the other of copper, each covered with gutta-percha, are to be joined at both ends, where a portion will be left uncovered. One junction will be buried in the bore, while the other will remain above ground available for observation. A current will flow through the circuit composed of these two wires, whenever the two junctions are at an unequal temperature, and the observer will immerse the accessible junction in a basin of water containing a thermometer, and will regulate the temperature of the water until he finds by a galvanometer that no current passes. He will then know that the temperature of the water, as indicated by the thermometer, is the same as the temperature of the buried junction.

A LECTURE EXPERIMENT.—Mrs. F. E. Nipher gives the following interesting lecture experiment in *Nature:* A glass flask of about a litre capacity is partially filled with water and closed with a cork, through which a tube passes which terminates flush with the lower side of the cork. Above, the tube is bent twice at right angles, the other extremity of the tube dipping below the surface of water of ordinary temperature. The water of the flask is now boiled, and as soon as the air has been driven from the flask remove the flame and allow the water of the vessel to recede into the flask. At the first entry of the cool water the steam will be so greatly condensed that a brisk ebullition will take place, which, for a few seconds, checks the inflow of the water, driving it down the tube; further cooling quickly causes more water to enter, when the same phenomenon is repeated. After two or three oscillations of this kind the water runs continuously, and with great velocity, into the flask, which should not be allowed to fill, as it is in that case usually broken by the shock, which terminates the experiment.

RIPENING GRAPES OFF THE VINE.—M. Pollacci has lately investigated the disputed question whether grapes separated from the plant undergo an after-ripening, as is the case with apples and pears. Several kinds of unripe grapes were cut off with scissors, and three portions formed of each kind. One portion was then taken, and its quantity of sugar and acid determined immediately. Of the two other portions one was placed in shade, the other in sunshine, and after ten or twelve days the same data were procured. It appeared that there was a small increase of sugar and decrease of acid, and the differences were greater in the case of the grapes exposed in sunlight than with those kept in shade.

INFLUENCE OF LIGHT ON CEMENT.—To ascertain the influence of light upon cement, Heinzel divided into three portions a lot of cement and exposed one of these (A) to the air and full light, another (B) to the air and diffused light, and secluding the third (C) in darkness from the air. After six months it was found that A made a weak mortar by absorbing 38% of its weight in water, and it had become friable; B with 33⅓% of water made a mortar too adhesive to the trowel, and it yielded up some of its water; C with 33⅓% of water made an excellent mortar, easily stirred and flowing, and it parted with some of its water. After setting for 28 days the relative strengths were A, 3; B, 37.9; C, 44.6.

PROPOSED TEST FOR COTTON.—A recent German scientific journal states that linen threads, when dipped in an alcoholic solution of the substance known in commerce as *aurine* or yellow coral, and subsequently washed in a concentrated aqueous solution of carbonate of soda, acquire a rose-red hue, the cotton threads remaining colorless. Accordingly, to detect cotton in linen fabrics, if a small piece of the suspected fabric is frayed at the edges and then treated, the presence of colorless threads will at once reveal the presence of cotton.

GERMAN MEETING.—The German Association of Naturalists and Physicians will assemble this year at Cassel, on September 18th, the sessions continuing for one week. Among the addresses promised, are the following: "Relations of Darwinism to Social Democracy," by Oscar Schmidt; "Symbiosis, Parasitism," etc., by Professor De Bary; "The Education of the Physician," by Professor Fick; "The Color Sense and Color Blindness," by Dr. J. Stilling.

INSECT VOICES.—One of the walking-stick insects, or *Phasmidai*, has been discovered by Mr. Wood-Mason to be a sound-producing insect. In *Pterinoxylus* he found that a stridulating noise was produced by a rasp on the hind wing in connection with a resonant swelling on the wing-cover, and this appeared in the females. This apparatus is much like that of locusts (*Œdipoda*).

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

AMADOR.

Preparations.—*Dispatch*, Sept. 14th: Extensive preparations are now being made by McLaughlin & Co., proprietors of the Volcano and Jackson ditches, under the Superintendency of Mr. L. McLane, to commence the miniug out of Grass Valley—which lies just below Aqueduct City—as soon as water is sufficient. The necessary channels are being cut and flumes laid for the conversion of their little valley into a gigantic deep gravel mine, this Winter.

Phenix.—*Ledger*, Sept. 14th: The 80-horse power steam engine is found to work admirably. The crushing, no longer dependent upon the water supply, can now be kept up throughout the year. The Burleigh drill has been introduced. The lumber used in the works is cut on the premises. The monthly output of bullion runs from $30,000 to $50,000. For over 400 feet the ledge is from 30 to 80 feet wide. The employes of mine and mill number 105.

Items.—Work has been resumed on the Alpine at Plymouth. Nearly, if not quite all the hoisting machinery for the Empire is on the ground. The Volcano tunnel is in something over 1,100 feet, a little more than half the required distance.

The Pennsylvania, California, (or Potosi) Talisman, Crown Point, Bonanza, and Kennedy mills are all idle, representing an aggregate capacity of 100 stamps.

EL DORADO.

Items.—*Mountain Democrat*, Sept. 14: The Gold Deposit company have purchased the Lyonsdale mill and machinery, which will be immediately transferred to its new site. The Ida Livingston is now working with a double force of hands. The ore is bigh grade and the body is widening. The Chaparral has a rich ore body which is widening. Full corps of hands is now working.

INYO.

Rex Montes.—*Independent*, Sept. 14: In tunnel No. 4, a streak of the very richest class of ore has been met. Good ore is coming from Nos. 2 and 3 in the old works. Ore is also coming from the old Silver Sprout. Preparations are being made for extending operations.

Lean Valley.—The old mill has been kept running quite steadily for a year past, by the proceeds of which a number of miners have been enabled to sink on their mines and thereby develop some very promising ore bodies at greater depths than were ever reached by the first operators in the camp. Among others giving good reports is Brown's Hope at 200 feet, and the Sewana. Two tons of ore from the latter were recently worked at the Silver Peak mill, yielding no less than $1,768, or $893 per ton. A new mill is expected, perhaps two. Reports from Gold Mountain district also are encouraging.

CALAVERAS.

Haskin's Mine.—*Citizen*, Sept. 15:—At present the ore is being crushed at the Carlton Mill. A clean-up will be made in a few days. From 12 to 15 men are now employed. The vein varies in width from 12 to 24 inches. The ore averages $100 per ton.

Secretary Mine.—This mine has been crushing refuse ore for several weeks. Its recent clean-up paid considerably more than cost of crushing. The mine is to be opened more extensively. A 10-stamp mill has been put up.

Granite Mine.—The ore in this mine is low grade, but can be obtained in sufficient quantities to pay for working. The 10-stamp mill will be kept constantly at work.

Items.—The Grasshopper Mine is again being worked. The Butcher John claim, recently purchased for $4,000 by Kellogg, Garland & Co., is being vigorously worked. The Valentine is idle, waiting for the issue of the patent. Wm. Lacy still holds the claim by keeping armed men upon it.

MONO.

Champion, *Standard*, Sept. 11th: The new hoisting works are giving satisfaction. The engine and reel will be suitable for a depth of 1,000 feet. There are 23 men employed.

Bulwer.—Connection will be made with the Standard new shaft about the 1st of October. The ledge on the south drift is two and a half feet wide and is looking well.

Goodshaw.—Repairs and hard rock have retarded progress. A change in the rock has taken place and progress will be better. Machinery for hoisting works is on the way.

Queen Bee.—The ledge at a depth of 90 feet. The vein formation is seven feet wide of gold bearing quartz, well defined.

Other Mines.—A ledge of 20 inches wide prospecting well, runs in the bottom of the Croesus two-week 25 foot shaft. The Flood and Hurley tunnel is now the Republic Con. Mine. The North Richer ledge has increased from four inches at the surface to four and a half at 50 feet. Assays have ranged from $2 to $2.50. Signs of near approach to a rich ore body in Bechtel. In Sitting Bull, at 70 feet in shaft, a fine body of rich quartz has been struck, which is contained in vein formation four feet wide. A 4-inch ledge, giving high assays, has been developed in the Bodie Bluff location. The Boh Ingersoll claim, west of the Goodshaw, has let contract for 100 feet more of shaft. Will soon be incorporated. The Lake district 20-stamp mill will soon be in operation. Ore has already been shipped for it.

PLACER.

Independence Hill.—*Forum*: J. B. Hobson is fitting up the Independence Hill claim. It was purchased lately by a San Francisco company. The ground prospects rich, and extensive hydraulicing is to be commenced.

Other Claims.—The owners of the Prichard claim were so much encouraged by the run of last Winter that they are making considerable expenditures in preparing for the coming hydraulic season. The same may be said of the Barter Entwhittle Mills, Philips and other claims on the Indian Canon side, a mile or two above Iowa Hill. Frazier's claim, at Bird's Flat, will be run this next season. The Orion Company have let a contract for fitting their claim for hydraulicing. Below the Iowa Hill mines a flume is being put in to catch the tailings. At Lucas Flat, a company in prospecting an old drift mine, have struck rich gravel. The Wisconsin Hill cement mill is proving a success. The Lehanon drift claim, located just south of Wisconsin Hill, which has lain idle for some years, is about to be started up again.

NEVADA.

You Bet.—Grass Valley *Union*, Sept. 14: The only washing being done is in the Spaulding claim and the old Neece & West ground, superintended by Geo. S. Powers. The tunnel that is being driven in the Brown claim requires 120 feet more before it can be utilized in working the ground. It will be completed in time for the working of the ground when the winter supply of water comes. This claim has heretofore been worked by drifting, but in future it is to be worked from surface to bedrock by the hydraulic pipes. A portion of the gravel, which is firmly cemented together, will be run through the stamping mill, as has been the custom at this mine.

Town-Talk Hill.—*Herald*, Sept. 10: In the ravine west of the New England mine, Thos. Bennett & Co. are running a tuunel which is expected to tap the Alta Hill channel.

New York Hill.—Sixty-two loads from this mine cleaned up, at the Omaha mill, $12,442. This without the sulphurets, which will bring the amount up to $14,000. Of late the mine has improved very much in appearance, carrying a fair-sized ledge, which is very rich, both at the bottom of the shaft aud on the north side, which promises to yield equally as rich rock as the above for some time to come.

Items.—The Yuba river miuing company, operating in the bed of the main Yuha, near Smartsville, is reported to have found a rich streak of pay dirt. The water supply for the Milton company is gradually lesscuing. The Sweetland Creek mine, drawing its supply from the Eureka Lake canal, will have sufficient water to last through the season. The Life Preserving mine, at Bald mountain, near Auburn, known here as "Doc. Wilkinson's honanza," was sold last month to A. G. Garnett, of San Francisco, for $2,000. Rocky Bar has a vein of good size in its lower level, and late crushing of trihute rock from different levels paid $30 to $40 per load. The new Deadwood ledge, 16 inches wide, will go from $80 to $100 per ton. Au improvement is reported in the Gold Hill mine. Experts have decided that it will pay largely to drift in the Blue Banks mine. The Magenta Con. mining company, Ophir hill, are applying for a patent to their ground.

NEVADA.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Sept. 18th: The daily yield of ore for the week has been 160 tons. The repairs to the main shaft have been completed to a point 25 feet below the 1,500 station. The heat is still very great. Tbe C. & C. shaft is now down 35 feet below the 2,050 station. The flow of water is still strong.

California.—A lateral north drift is about being started at a point 400 feet west of the C. & C. shaft on the 1,950 level. This drift will form a principal working thoroughfare and air gallery, and when completed will connect directly with the Ophir on that level. The heat on the lower levels is still very great.

Original Keystone.—The frame of the hoisting works is up ready to cover in, the boilers are in place, most of the machinery is on the ground and everything that is possible is being done to push the works to completion.

Mexican.—Sinking the joint Mexican Con. winze on the north line is making good progress, the bottom in good blasting ground. The hoisting engine is in place and will be ready to start up in a very short time.

Trojan.—The north drift at the second station level is steadily advancing, the face in quartz of a good character. At the distauce of 155 feet from the station a crosscut was run into the vein 25 feet, the car samples from which averaged $30 per ton, assay value.

North Con. Virginia.—Sinking the main shaft is making the best of headway, the bottom still in hard blasting rock. The manufacture of the spleudid new hoisting machinery has been commenced.

Ophir.—Sinking the main incline is going vigorously ahead, the bottom having passed through the hard rock recently encountered in a soft formation of clay, quartz and porphyry, which looks as if it were really going to make into a body of quartz and ore. This discovery is something entirely new and unexpected, and begins to look as if it might prove of considerable importance.

Scorpion.—This mine comprises 4,000 feet of ground lying in front of the Mexican, Union Con. and Sierra Nevada mines, on the east. The locatiou dates hack to 1859, and is one of the oldest on the Comstock. Preparations are now being made to sink a large working shaft and develop the property.

Lady Bryan.—The water is drained from the shaft and a station is being opened at the 600 level, 350 feet below the deepest level yet prospected in the miue. Crosscuts have also been started in the ore vein north of the shaft, on the 350 level.

Alta.—The 1550 station is opened and a drift started castward to cut the ore vein. This drift is iu a distace of 40 feet, the face in vein matter mixed with streaks of quartz carrying spots of good ore. A large amount of the ore vein is stripped ready for crosscutting on the 1250, 1350 and 1450 levels whenever it is desirable to do so.

Justice.—The hottom of winze No. 1 below the 1300 level is showing some very fine ore. At the depth of 100 feet a crosscut will be started in this winze to prospect the ore vein. That depth will be reached in a very few days. As soon as the south drift on the 1450 level of the Alta reaches the Justice line the drift will be continued southward by the Justice until a connection is made with the douhle winze now being sunk below the 1300 level.

Belcher.—The joint crosscut on the Crown Point line, on the 2360 level, is making good headway, not having yet reached the ore vein. Crosscut No. 2 is apparently just entering the ore vein.

Best & Belcher.—The joint east crosscut on the 1900 level from the hottom of the joint winze is steadily advancing, the face in very favorable vein matter. Sinking the new joint Gould & Curry shaft has been commenced and is making excellent headway.

Hale & Norcross.—A large working drift has been started from the 2000 station to connect with the Chollar combination shaft.

Overman.—The main south drift on the 1600 level is steadily advancing, the face iu soft porphyry, carrying streaks of favorable looking quartz.

Sierra Nevada.—Sinking the main south incline below the 2100 level is making good progress, the quartz and ore still showing at intervals in the hottom of the winze. The prospects of a big ore development, when the crosscutting of the 2200 level shall have been commenced, are steadily increasing.

Union Con.—The east drift from the main north drift on the 1500 level, running to connect with the North Consolidated Virginia shaft, is making the best of progress, the face in clay and quartz of a very lively character.

Caledonia.—The south drift on the 1400 level is passing through a fine, favorable quartz formation. The water in the joint Overman winze is gradually subsiding.

Savage.—A breakage of the pump boh on the surface during the first part of the week permitted the water to rise again to the 2000 station. The damages have been repaired.

Gould & Curry.—Sinking the Best & Belcher and Gould & Curry new joint shaft has been commenced and is making good progress.

Leviathan.—The north drift on the 750 level is being pushed ahead with speed. The small veins of quartz and ore encountered are of the most favorable character.

Silver Hill.—The water has been drawn from the shaft, and a full force of men are now employed in cleaning out and repairing the drifts on the 900 level, so as to resume the work of prospecting.

Succor.—Sinking the main shaft is making splendid progress, the rock in the bottom blasting out finely.

Senator.—Under the new management, work is soon to be resumed in this mine. Lateral drifts will be run from the Sutro Tunnel which passes through it, and its ore resources developed at the most eligible points.

Morning Star.—Cleaning out and retimbering and repairing the main tunnel to reach the ore vein is making good progress.

Julia Con.—Crosscut No. 1 on the 2,000 level is steadily advancing, the face in vein material of a very favorable character.

Bullion.—Sinking the main incline is making the best of progress, the hottom still in quartz and low grade ore.

Chollar-combination Shaft.—Excavating for the water tanks and pumps is making good headway. The north drift on the 1,600 level, running to connect with the Sutro Tunnel, is making good progress.

Solid Silver.—During the past week the crosscut west, 1,100 feet from the mouth of the main tunnel or adit of the mine, has been extended to the total distance of 25 feet. It has passed through the west ledge at that point, which is found to be fully eight feet in width. One half of this shows good ore with streaks of porphyry.

Con. Dorado.—The machinery is all in place, and will be ready to turn on steam in a day or two more.

Lady Washington Con.—The north drift now being run through the Benton ground on the 1,250 level will soon reach the south line of the Lady Washington Consolidated, when it will be continued through the entire lengtb of the claim, opening up the entire mine ready to crosscut at that depth.

In New Mexico they thresh wheat by driving sheep over it.

News in Brief.

The Denver, Colorado *Tribune* is one mass o politics.

Contract has been let for the ties of the Bodie railroad.

At the South the yellow fever has commenced to abate.

Mining in Victoria, Australia, is reported to he improving.

In Cyprus 307 meu are in the fever hospital, out of a force of 2,640.

A new crater had opened in V esuvius, in the bottom of the old one.

The air pipes and drilling machines are being used in the Julia branch.

There is question about the houndary between Butte and Plumas.

Another fire in San Bermardino. Total loss, upwards of $100,000.

Business with Tennessee, Louisiana and Mississippi is at a standstill.

An art gallery costing £25,000 is to he erected in New South Wales.

The Guatemala coffee crop is in excess of any previous year and is very fine.

A Steam wagon is to be put on the mail route hetweeu San Diego and Yuma.

The Treasury will exchange standard silver dollars for United States notes.

In New Orleans, Sept. 9th there were 325 new cases of yellow fever reported.

The Leadville, Colorado, mining excitement has injured the older mines of Alma.

Gold has been found in New Guinea. Shall Eugland annex what Holland claims?

Anxiety is felt for the safety of the Hayden surveying party in Yellowstone Park.

During August over 16,000 tons of coal were shipped from Seattle to San Francisco.

New Zealand is sending to New York for large numhers of hinders and reapers.

Fires on the Columhia have recently damaged settlers to the amount of $500,000.

The Sutro tunnel has been temporarily stopped at a point 20,500 feet from its mouth.

Two Chinese sluice robbers were killed at French Corral, Nevada county, Sept. 6th.

Deaths at Havana during August included 375 from yellow fever and 38 from small pox.

A malignant plague has been brought to Readville, Mass., in hair from Siheria and Poland.

The whole Bodie community justify the killing of the Blackhawk mine jumper, Jack O'Hara.

It is said that the remaius of Custer interred at West Point were those of a teamster selected at haphazard.

The Mountain Bright and Rough & Ready mines of Mount Posi district, Nevada, were sold for $35,000.

California and Oregon are the only States of the Union allowed separate exhihits at the Paris exposition.

During August 3,153,259 pounds of hullion and 2,823,666 pounds of ore passed over the Utah Southern road.

The deposits in the Carson mint during August amounted to $525,468.84; standard silver lars coined, $310,000.

On the Morris grant, near the Central Pacific Railroad, an artesian well 2,000 feet deep has not yet reached water.

It is now said that ahout 3,000 hop-pickers are wanted in Puyallup valley. Wages, ahout 25% hetter than last season.

Mining Share Market.

The Comstock market has been pretty steady, showing slight declines in some and noticeable advances in other stocks. The fall of Sierra Nevada from its place above $200 was attributed to reports of water in the mine. These reports were denied then and are, we believe, still contradicted hy good authority. Nevertheless, Sierra Nevada has not reached so high a point again. On the 13th a strike was reported in Bullion. On the 16th the strike was declared improving. Still, the market does not seem to have been ruffled on Bullion. Similar reports on Gould & Curry and Con. Virginia caused something of a rise in each of these. The Virginia *Enterprise* has published editorials on the Comstock worthy of notice. It says: For three years the work in the various mines has been to sink winzes and inclines, and now from the Silver Hill on the south to the Utah on the north it looks as though every mine with two or three exceptions was either just commencing to crosscut or just about to commence. This is so in the Justice, Lady Washington, Alta, Benton, New York, Caledonia, Overman, Belcher, Crown Point, Yellow Jacket, Con. Imperial, Alpha, Bullion, Julia, Hale & Norcross, Savage, Gould & Curry, Best & Belcher, the honanzas, Ophir, Mexican, Union Con. and Sierra Nevada. These explorations are at depths varying from 1,100 to 2,300 feet.

In the Bodie stocks there has been a marked decline. It is said that this is due to no fault of the mine. Slurring reports ahout this district are said to he unjust. The district is peculiar, and hence prophecies cannot he made for good or for evil, and parties interested should not show a disposition to believe the evil any more than the good. As a man in Virginia puts it, Bodie will come up when Sierra Nevada has cooled down.

ALPHABETICAL CATALOGUE

—OF THE—

13th Industrial Exhibition of the Mechanics' Institute, San Francisco, 1878.

EXPLANATION.—The Pavilion is divided into 26 sections, indicated by the alpbabet, viz.: A, B, C, D, etc. Also into nine divisions commencing with one, which embraces all exhibits along the Eighth street side wall. Divisions 2, 3, 4, 5, 6, 7, 8 and 9 range through the Pavilon from west to east, each section and division being separately indicated by the letter, whicb may be found uear the ceiling on eacb side of the Pavilion, and under the galleries.

THE FIGURES are at the ends of the Pavilion and galleries.

THE ITALIC LETTERS denote that the articles described are located in the galleries.

PICTURES and articles in Rooms 1, 2 and 3 in the Art Gallery are enumerated in another Catalogue.

NAMES AND EXHIBITS. LOCATION.

Ackerman Bros., Vienna Bent Wood Furniture. 3 *V*

Adams, A. P.. Compressed Coffee. 4 L

A patent process hy which browned and ground coffee is rendered impenetrable to air, thereby retaining its aroma and strength in full, besides being so readily prepared for use, and clearing itself at once without adding anything for that purpose. Manufactured of the best herry the market affords, it is pure coffee, and its use is never discontinued, when once commenced. Uniform strength and flavor is obtained hy using it according to directions, and its economy is testified to by hundreds of large establishments that now use it. Depot, No. 51 Fremont street, S. F. Send for circular.

Adams, L. D., Patent Car Coupler Model. 7 O

Ainsworth, D. H., Fire Kindlers. 1 J

For economy, neatness and dispatch, this little wooden invention is as much to he applauded as its simplicity is to he admired. It consists of nn arch or grate of little pine slats, about 8x6 inches in size and two inches high, the under edges of which are soaked in a resinous substauce. Placing this in your grate it holds the coal or wood up nicely, so as to allow free draft, and the resin takes fire at once from a match or other flame, and your fire is as surely huilt as tbough it had been started by an incendiary with coal oil rags. It is put up in crates of 100 kindlers each, and sold at $1.25 per crate, by D. H. Ainsworth, manufacturer and sole agent, No. 770 Bryant street.

Allen, Mr. (Allensdale), ass't of Grapes. 4 V

Appleton, Mrs., Spray Work. 3 *F*

Arnold, N. S. & Co., Spiral Pipe, Adjustahle Elhows, Files, Nuts and Bolts, Pipe Cutting Machines, Decorated Toilet Work. 6 G

Armstrong & Smith, Ale, Porter and Cider. 6 K

Arsher, J. M., (San Diego) Cal. Bananas. 4 V

Atkinson, G. T., Turning Lathe and Fancy Turned Articles. 6 W

Bachelder Mnfg. Co,, Napa "Iron Clad" Self-regulating Windmill, Iron Tray Wheelharrows. 4 Y

This self-regulating wheel is one of the most valuable among the many improved windmills. It is simple and compact, and of great power, as the whole of the face of the wbeel is filled with fans, and tbe slats composing the fans are of unusual width at the outer circumference, and built on what is called the "gain twist" principle. Tbe oil fountains are protected from dust, and the stroke is adjustable. It is a very light, free-running mill, running in wiuds that are insufficient to start many others. In a gale the wheel adjusts itself to the force so as to present less surface to the wind, thus regulating themselves to an even rate of speed. Address Bachelder Manufacturing Co., Napa City, Cal.

Bailey, Thomas & Co.. ass't of Wool. 4 V

Baluy, A. J., Ostrich Feathers. 3 *B*

Baker & Hamilton, Champion Mower, Jackson's Light Weight Horse Fork. 2 Z

Beamish, P., Gents' Furnishing Goods, Mfrs. of White Shirts. 5 L

Bequette, D., Plans for Mill Building. 7 M

Behreudt, H. & Co., Trunks, Valises, Satchels and Bags. 2 *X*

Benjamin, Henry A. & Co., Seltzer and Congress Water. J 4

These springs are situated in the Coast Range of mountains, eight miles southwest of Santa Clara. The analysis of these waters sbow them to possess wonderful curative powers, not excelled even by their celebrated Saratoga, N. Y., namesake, or imported German seltzer. Physicians of Sau Francisco prescribe them to their patients in preference to any other mineral waters. They are in constant use as a beverage in all first-class saloons. Depot, No. 162 New Montgomery street, cor. Howard, S. F.

Bidwell, Gen'l. John, Apples, Peaches, Pears, Plums, Figs, Wheat, Barley and Oats, Dried Fruits, Almonds, Corn, Squash, Watermelon, Chinese Polo Qua Oranges, and Egg Plant, etc. 4 V

Biglow, A. T., first Rice raised in Cal. 4 V

Black, H. M. & Co., Coupe, Family Carriage, Rockaway, 3 Top Buggies, 2 Buggies, open; 1 Child's Coupe. O 2

Blakeley, Edward, S. F., Mixed Dyes. 7 N

Blockman & Cerf, I X L Limestone and Lime. 4 V

Bloom, Samuel, Tanned and Colored Sheep Skins. 1 *H*

Blowers, R. B. (Woodland, Cal.) Black Hamburg, Zinfindal, Flame Tokay, Rose Peru and Blk Malvoisie Grapes; Muscatel Godo Blanco Raisins, Dried Pears and Apples. 4 V

The very excellent display made by Mr. Blowers, of both green and dried fruit, deserves special mention. His raisius have taken the place of the imported article, and are preferred hy all families; and he is still further improving his dried fruit products by the use of the fruit drier invented hy him, whicb bas taken premiums without number. Mr. Blowers has recently experimented with the Mefford process, and the beautiful specimen box of dried or preserved prunes is the result, whicb is very flattering to his skill as a first trial.

Boca Brewing Co.. Boca Beer. 6 J

Berry & Place, Douhle-Acting Steam Pumps, Self-Feeding Rock Drills, California Windmill and Model. 8 J

Berryman & Doyle, Wellington Coal. 4 X

Best, Daniel, (Alhany. Ogn.) Pat. Adjustahle Washing Machine and Clothes Wringer. 6 R

This machine consists of an endless slotted helt, running around two rollers, with a series of smaller rollers above to press the clothes down upon them. These latter nre retarded hy a hrake, which causes them to ruh the clothes ns they pass through, very much as they would he on a wasb hoard by hand. The water is alternately pressed from one part of the clothes while the other parts are again being wet, and they finally leave the machine drier than wrung hy hand.

Bofinger, J., Metal Spinner. 8 X

Bowdoin, L. M., Vermin Fumigator Kitchen Cabinet. 4 *Q*

Borkheim, H., Gents' Patent Drawers. 2 *B*

Bothin, H. E., Mrs. Mills' Cream Yeast Powder. 5 V

Boudoin, L. M., Rotary Top Kitchen Cahinet Tahles. 4 *Q*

Bowen Bros.. Premium Yeast Powder. 5 V

Bradford, J. B. (Courtland, Sac. River) 3 Bottles Port Wine. 4 V

Brehm, R. W., Turning Lathe, Fancy Turned Articles. 6 V

The beauty of these articles cannot be described. It is only by seeing them, after having passed tbrough the turning and polishing at tbe skillful haud of Mr. Brehm, that the beauties of the grain of our Pacific coast woods can he appreciated. Nearly every article of *virtu* that can possibly be made of wood, is turned nnd exhibited by Mr. Brehm, such ns sleeve buttons, napkin rings, bouquet cups, thimble cups, vases, cane-heads, breastpins for pictures, etc. At his factory, on northeast corner of Mission and Main streets, be does a general wood-turning business, and other wood ornamentation.

Brown, G. T., Improved Hay Carrier. 6 Z

The above entry gives but little idea of what this machine is capable of. It is a hay-fork and carrier combined. Most of the hay-forks have to be attached to several different places during tbe operation of filling a barn, but this inveution is a carrier, and when once up runs from end to end of the barn like a thing of life. It travels on a five-eighth iron rod, and drops the bay at any desired point. It can also be used to take hay out of the harn or for stacking and loading in the field. They are furnished on trial to responsible farmers, or sold, by G. T. Brown, Stockton, Cal.

Bryant, Dr. F. G., Pat. Fire Escape. 5 *C*

Briggs, J. W. (San Jose) Hungarian Plums 4 V

Britton, Mrs., Patch Work Quilt. 1 *P*

Britton, John (San Jose) Dried German Prunes. 4 V

Brown, Chas., Ranges, Stoves, and Tin ware. 2 C

Brown, Dora, A. (San Leandro) Silk Bed Spread. 1 *U*

Browell, John., Pat. Chimney Flues and Tops. 9 E

Burr, C. H. & G. W., Weather Strips. 7 U

It is claimed hy all the leading arehitects in the United States to he the hest and cheapest, and the only weather strip that will keep out the dust, drafts or rain, and stop the rattling of the sash. It is used instead of the old parting-stop in the windows, the ruhher side pressing against the sash—thus making it perfectly air tight, the strips heing out of sight. It does away with nailing, and does not interfere with painting, oiling, varnishing, or putting in your window screens. No. 667 Mission, near Third st.

California Furniture Co., Parlor, Bed-room nnd Settee, Window Drapery, etc. 2 *Z*

The parlor and bedroom sets shown as above are peculiarly neat and substantial, and indicative of an ability to turn off auy kind of work desired. Running a large force of hands and possessing peculiar facilities for economical working, and being a pioneer in furniture manufacturing on this coast, this company can fill orders for large or small lots of furniture, plain or ornamental, at the shortest notice. Office and factory, Nos. 220 and 226 Bush street, and 649 and 651 Market street.

Cal. Bellows Mlg. Co., Sides of Leather and Bellows, assorted sizes. 8 G

Cal. Paint Co., Averill Mixed Paint, Copper, Plumbago, and China Gloss Paint. 3 R

The whole secret of the superior excellence of the Averill mixed paints, manufactured by this company, lies in the superior qualities and absolute purity of the chemicals used, lead, oil and zinc, and the fact that they are thoroughly ground and incorporated with water glass, or sillicate, which has tbe effect of more closely uniting the lead and oil, or rather enabling the oil to hold the lead in solution, and making it less liable to be affected by weather. Tin, coated witb tbis paint, can be repeatedly bent back and forth without cracking or loosening tbe paint. It is economical and durable. Salesroom, No. 329 Market street, San Francisco.

Cal. Paper Co., Print Paper, Straw Wrapping Paper, Hardware Paper, Straw Board and Barrel Board, Butter Paper. 7 S

This compauy make a fine showing of homemade paper that is competing in our market with the Eastern article. The factory is located at Stockton and turns out four tons straw wrapping paper, and ahout eight tons printing paper per day. They also make about two tons straw hoard and tar hoard for harrels and book binders' use. Egbert Judson is President, and E. T. Cooper, Secretary. Office, No. 10 California street, San Francisco.

Duffy, T., Rustic Work. Garden.

Beautiful in design and excellent in workmanship are the rustic articles in wood and concrete exhibited by Mr. Duffy. His grotto is fancifully decorated and would be an ornament in any garden, and a comfortable retreat on a hot day. Of shell-mounted vases and pillars he shows several unique and pretty patterns, and for rustic wood work, comprising chairs, settees, flower stands, arbors, trellises, etc., he has few equals. His aquariums and ferneries are solidly built and ornamental in pattern. He has built up quite a business since his first exhibit three years ago, and the encouragement he receives has had its effect in the increased beauty of his work. He is also an upholsterer, and has his place of business at the corner of Leavenworth and O'Farrell streets.

Fischett, Mrs. S. D., Turkish Rug. 1 Q

Flynn, John, Horse Shoes and Spurs. 9 J

Follansbee, Geo. S., Follansbee Pump Co.'s Patent Double Propeller Pump. 8 M

DOUBLE PROPELLER PUMP.—The attention of visitors at the Mechanics' Fair has been directed to the Follansbee Double Propeller pump by the enormous and continued stream it pours forth. It is one of the most powerful lifting pumps ever put before the people, and is so simple that any one can see at a glance what its capabilities are. It requires no oiling, and any one of them over six inches in diameter can have an engine attached direct and thus avoid the use of belting, which makes invaluable for wrecking purposes, pumping water ont of vessels and irrigating and draining work. It will be on exhibition at the State Fair also, and the agent or the Follansbee Pump Company, Boston, Mass., will send circulars and furnish pumps of any size. Manufactured at Golden State and Miners' Foundry, First street, San Francisco.

Gordon, James E. & Co., Show Card Handles, Weather Vanes, Locks and Axes, Chain Forge and Tools. 5 P

No more interesting exhibit has ever been made in the fair than that of this firm. The chain forge has always attracted much attention and every one leaves satisfied that the chain is first-class as to quality of iron and workmanship, and its use demonstrates the correctness of the verdict. They also make a fine display of other goods as above mentioned, besides many ornamental weather vases. Their exhibit, though large, gives no adequate idea of the manner and variety of the hardwate kept by them at Nos. 254 and 256 Market street, and 8 and 10 Front street.

Gordon, Mrs. H. E., Crochet Bed Spread. 1 V

Grave & Co., Coupe, Oppenheim Buggies finished, Oppenheim Buggies with Tops, Oppenheim Buggies inlaid Cloth, Business Wagon. 2 T

The interesting exhibit of vehicles made by this firm deservedly received many flattering eucomiums, and attracted much interest from visitors in general. The Oppenheim buggy is the most convenient form of carriage the man of moderate means can possibly have, as it can be instantly transferred from a single seated buggy to a double seated carriage, and back again at pleasure. All styles of buggies, phaetons, carriages, hacks, couches and wagons are manufactured by them, and their exhibit hardly samples their stock. Excellent work, good material, and fine finishing are specialties at their factory, Nos. 421 and 423 Pacific street.

Hayes, D. D., Fire Escape Truck and Hose Clamps. 7 W

Heald's Business College, Telegraphic Instruments and Apparatus. 4 D

Hermann, P. A., Improvement on Carriage and Wagon Wheel. 2 W

This improvement consists in a metal clamp enclosing the felloe at the point of junction of the spoke. The clamp is perforated to admit the passage of this spoke tenon, and is riveted through the felloe, and streagthens it and prevents its splitting, also. The wood of the spoke, receiving the jar and strain of all shocks endwise of the grain presents greater resistance to such pounding than the felloo, which receives this pounding crosswise of the growth, and consequently the latter gives to the shock. This metal clamp protects the felloe from this action. Address Peter Hermann, 35 Post street, S. F.

In addition to the above mentioned articles Mr. Maekey is an importer, manufacturer and large dealer in tapestry and ingrain carpets, oil cloths, mats, rugs, window shades, lace curtains, cornices, etc. Everything in the carpet line can be found at his large and elegant establishment, No. 1110 Market street, where purchasers will find low prices, good articles, polite and immediate attention. Being an old and experienced carpet weaver, Mr. Mackey brings to bear upon his business an amount of practical experience that but few in the trade possess, and can therefore discriminate carefully in selecting his stock.

These wheelbarrows are very superior in their construction, being made of No. 12 iron, one-eighth of an inch thick, and made on an iron block. while the ordinary patterns are only of No. 16 iron. This firm manufactures railing, stairs, vaults, doors, locks, beams, liatels, bolts, anchors, bedsteads, safes and all kinds of house-work, besides a great variety of other wrought iron work of the best quality and improved patterns. The Eureka Iron Works, Nos. 317 and 319 Howard street, between Front and Beale, are very complete in equipments, and work is turned out promptly on orders.

McLean, A. A., Perforated Frictional Belts and Abdominal Support; also, California Elastic Truss. 6 M

Perforated Frictional Belt. It cures rheumatism, lumbago, paralysis, kidney and liver complaints, female weaknesses, etc. Dyspepsia and all diseases of the bowels permanently relieved. The Abdominal Belt is valuable to ladies in a delicate state, and recommended by physicians and can be had at all druggists or at the general agency, 605 Sacramento street, S. F. California Elastic Truss is the best. Send for price-list of belts and trusses.

The Week.

Certainly times are changing. Suddenly the papers of our hydraulic mining counties begin the talk of claims prepared for the winter supply of water. Cleaning up time is almost over for the season, and many mining men are counting up the bullion that their industry has extracted and are resting quietly "on their ores," as the papers put it now, waiting for the next season. Among our southern counties, Mono increases day by day in activity, while Inyo and Fresno, sympathizing with their neighbor, are beginning to wonder if they too cannot find Bodie bonanzas.

A most important epoch has been reached in the history of the Comstock. Reference to our report of the state of the mining share market will show that if human experience can be depended upon as a prophet, great developments will surely soon be reported from Nevada. Arizona, too, is giving voice to sanguinary prophecies, and feels a little hurt that San Francisco papers have not sufficiently noticed that in August, Vampire and Mohave counties shipped to the city of said papers, $130,000 in silver bullion. In Tombstone district, Gird & Co. handed their mine to San Francisco parties for $90,000. These parties did not come to time, whereat Gird & Co. greatly rejoice, for one of those cool calculations, which may be entirely believed or not, according to individual experiences, makes out that in one of their mines alone, surface workings, to a depth of 10 feet and for a distance of 400 feet, have exposed to view $455,000!

The State Fair at Sacramento is entertaining its thousands, and all reports indicate a success in point of exhibits, attendance and money receipts considerably in advance of anything attained before.

On File.—"Improved Apparatus for Mounting Theodolites in Mines," E. Koch; "Virginia City," W. G. A.; "The Stonewall Jackson Mine," J. D. E.

Accidents to Miners.

There was a time when mine-owners were declared to be entirely void of feeling. They were accused of getting work out of their men just as they would out of mules, and in many cases it was time that the safety of miners was seldom looked to, and an accident which injured a mine was deplored far more than one that killed a man. That time is over now. The miners themselves have revolted against such indifference. Science has discovered means of avoiding many classes of accidents. Inventive genius has been exerted in improving machinery and methods. And finally the laws of some countries have come in to compel mine-owners to avail themselves of every means to secure the lives of their employes. Still, accidents continue. Every day limbs are broken and lives are lost in mines that are near enough to cities to be furnished with every appliance.

A few weeks ago it occurred to us that it would be interesting to keep some account of accidents happening to miners on this coast, with a view to determining their frequency and general causes. Without making any special search, we collected accounts of accidents which occurred in the space of a little over two weeks, and which jeopardized 23 lives. Of these, nine or 39% were endangered by caves or falling rocks, seven or about 30% by falls, and the remainder by various causes. In considering the different causes we have concluded that only four lives out of 23 or about 17% were put in danger by faults in apparatus used; that six or about 26% were endangered unavoidably; and that the remaining 13 or about 56% were jeopardized by culpable carelessness, in most cases to be charged to the victims themselves. In one case three men worked a new tunnel up under an old one, so close that the partition broke and the foolhardy miners were overwhelmed by an immense flood of water, and saved themselves only by most desperate efforts. In another case, in the Keystone mine at Amador City, a miner, after finishing his work in a drift, sat down on the edge of the shaft to await the coming of the cage to take him up. He fell down upon the ascending cage, striking a fellow-miner, who was knocked senseless, and injuring himself so badly that he soon died. Two men in the Bodie mine put up a scaffolding so carelessly that a falling rock carried both it and them down a distance of 45 feet. Two men stood in the bottom of the Boston shaft, at Moore's Flat, while a heavy block tied to a wet rope was being hauled to the top. The block, loosed from the rope, fell back, striking one of the miners upon the head and instantly killing him. A man at the Martin White mine ran a car into a chute so carelessly—it must have been so—that he went with it to the bottom. He was not seriously injured.

Among the accidents caused by, probably, defective apparatus, may be mentioned the breaking of the monitor at the Hatbaway hydraulic claims. The lever governing the nozzle had a flaw in it, which allowed it to break. The stream of water flying about in every direction killed one man and broke the leg of another. In the Sierra Nevada mine an unclosed valve in an engine—this is one theory given—led to the premature dumping of a giraffe. A piece of iron on the apparatus struck and broke open the skull of an employe at work near at hand. In the Mexican mine a cartridge that had remained unexploded in a blast was afterwards struck by a miner's pick. The miner was horribly mangled by the explosion.

Judging from this by no means careful, but nevertheless very interesting little investigation, the miners themselves are to blame for most of the injuries they receive "accidentally." When every precaution for their safety is taken by their employers, the miners certainly should exercise due care themselves.

During the time in which the above facts were collected, two coal mine explosions have been reported; one in Pennsylvania, prostrating seven men, the other in England, by which 250 or more lost their lives. The cause of the latter has not yet been fully published, if indeed it has been ascertained.

Boat Building.—Martin Vice, the well known boat builder of this city, exhibited at the recent Mechanics' Fair a very handsome six-oared barge which is up for raffle. She was built for a ladies' crew, has handsome fittings and two sets of light oars. Mr. Vice has been in the boat building business in this city for many years, and in addition to building fancy boats, builds numbers of them for hard service, such as ship boats, yachts, surf boats, etc. He has also made a specialty of steam yachts and steam launches. The well known, fast little steamer "Elaine" is one of his models. A visit to Vice's shop, at No. 22 Mission street, is always interesting to those of a nautical turn of mind, as there is always something in the stocks worthy of examination. The barge that was exhibited at the Fair was the handsomest specimen of naval architecture we have seen for a long time.

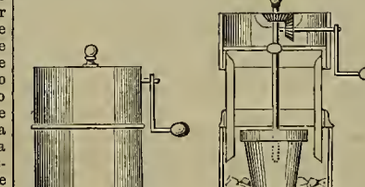
A New Portable Ice Machine.

Mr. Wm. H. Mansfield, of this city, has recently applied for letters patent through the Mining and Scientific Press Patent Agency, for a machine for the manufacture of ice in quantities small enough for family use. The freezing operation is conducted in a metallic cylinder, formed of three parts, the inner lining being of lead and the outer of heavy sheet metal, the space between being filled with asbestos or similar non-conducting material. In this cylinder are peculiarly-shaped molds, placed in a vertical position, so that the refrigeratory substance entirely surrounds each mold on all sides, although the molds are formed together in a circle. They are made somewhat tapering, being smaller at the bottom than at the top, so as to facilitate the removal of the blocks of ice formed therein. By their peculiar oblong shape and their arrangement side by side in a circle around the central cylinder, the refrigerative solution is enabled to reach the outer surface of each side of the mold. A glass cover shuts the top of the molds. So by taking off the cover of the metallic cylinder, it is possible to look into the molds without uncovering them and see how the operation of freezing is going on.

Stirrers are arranged on a shaft, to stir up the solution between the molds and side of the cylinder, so as to keep the solution agitated. This is only necessary occasionally, however; say every 10 minutes until the ice is formed.

The molds are filled with water, and a peculiar refrigerative solution, made by the manufacturers of the machine, is poured into the cylinder around the mold. The dashers are moved by means of a handle projecting through the cylinder, which serves to agitate the liquid, and bring fresh portions in contact with the sides of the mold. When the water in the mold has become ice, the cover may be lifted off, the molds taken out and reversed, when the blocks of ice formed in the molds will drop out into suitable receptacles.

This machine makes small cakes of ice, and one or more may be removed and the others left ready for use in the molds. The machine is portable and is intended mainly for family



use, where small quantities of ice are to be made at one operation. For families residing at places where ice is difficult to procure, from one to twenty pounds of ice can be made in 30 to 35 minutes. A machine of this kind has long been needed and the manufacturers intend rapidly introducing it, furnishing a refrigerative substance at the same time. This substance can be sold cheaply and used over and over again by simply evaporating it either in the sun or by the heat of a stove, an operation any one can superintend. The whole machine will only weigh from 10 to 75 pounds, according to size, and can therefore be moved about as conveniently as an ice-cream freezer. It is called the "Arctic Portable Ice Machine."

Electric Lighting.

We acknowledge the receipt from E. & F. N. Spon of "A Practical Treatise" on the above subject, translated from the French of Hippolyte Fontaine, by Paget Higgs. It is a new, complete and interesting work. It is partly a history, partly a philosophical treatise, and partly a practical guide for electricians and all others to whom the electric light may prove of any probable use. In its historical parts, its exposition of principles and statements of probable applications of the light, it is a popular book. In the comparison of machines, details, application and estimates of costs, it will prove of service to specialists and those who attempt to use electric lighting in practice.

"The work is divided into 12 chapters. The first six are devoted to the study of the voltaic arc, the lamps or regulators, the carbons, and some magneto-electric machines. The last six treat of realized applications, the comparative costs of several sources of illumination, of lighting by incandescence, and of the division of the electric light."

The work is fully illustrated, the explanations on the whole are clear. Every inventor seems to have received his due. Faults are pointed out where they exist, merits are fairly displayed, and the author's own conclusions seem to be unprejudiced and sustained by clear arguments. It shows scientific research and fairness. The sources of information of the author were very extensive, and he seems to have laboriously availed himself of all of them.

The book is published by E. & F. N. Spon, 46 Charing Cross, London, and 446 Broome street, New York.

The University Lectures.

We understand that it is now definitely determined to inaugurate the course of lectures on Special Cultures at the State University, by the appointment of Mr. C. H. Dwinelle as lecturer on Field Cultures. Mr. Dwinelle is well fitted, both by study and practice, to lecture upon these themes. He graduated in the course of agriculture in the Sheffield Scientific School of Yale College, in 1871. Returning to this State, he devoted some time to agricultural writing, and then embarked in the practice of agriculture. He is a close observer and an entertaining speaker. The course will begin about the 21st of October, after the mid-term recess, and continues through the present session.

There will probably be three lectures per week, on such days and at such hours as will accommodate the greater number of those who attend.

It is hoped, by a careful discussion of the natural history and value of plants of economic importance, and of methods and implements used in this and other countries in their treatment, to present facts of real importance to those who are now or who intend to be farmers.

The following heads will indicate in a general way the subject to be treated of, and the probable order in which they will be taken up, though that may be varied to suit circumstances, namely: farm implements and their uses; tillage, mechanically considered; irrigation; field and fruit cultures.

If sufficient interest is shown, it is intended to secure the services of competent specialists to treat of viticulture and dairying later in the year.

Although there are but two regular students prepared to attend these courses this year, a number of practical farmers have given their names as wishing to attend all of the lectures, or those bearing upon their specialties. All who wish to follow their example should write immediately to Prof. E. W. Hilgard, Berkeley. We trust that this effort to meet the wants of practical farmers will have encouraging support.

There are many young men and young women, graduates of excellent schools and colleges on this coast, who wish for a more thorough knowledge of the sciences bearing upon agriculture, but cannot afford the time and money required for a full university course. If these would spend a year at the University as special students, taking, in addition to these special lectures, enough of Botany, Zoology, Chemistry and Geology to fill up their time, we are sure that they would find it a profitable investment.

For the benefit of those who have lately come here, we will state that tuition in the University of California is free to all citizens of the State. Students from outside of our borders are charged a moderate fee.

Pump Manufacture.

Mr. W. C. Wilcox has recently established himself at No. 417 Mission street, between First and Fremont, where he is manufacturing the Wilcox steam pump, and patented hand and windmill pumps. He has in his shop machinery of the most approved kind for cutting, threading and fitting all sizes of iron pipe. Mr. Wilcox is also prepared to manufacture all kinds of steam and other machinery. He is making a specialty of a newly patented hand-pump, which is now being rapidly introduced. The same pump is also adapted for windmill purposes, and its simplicity of construction and operation is a guarantee of its staying in good order much longer than ordinary hand-pumps. He is also making a steam deep well pump, which has only lately been introduced. The engine is fitted so as to swing from over the well when it is necessary to draw the pump-rod out. The pump itself may be put down the well two or three hundred feet if necessary. Mr. Wilcox has been experimenting in deep well pumps for several years, and a number of them are in use in this city. The one referred to, however, is an entirely new device, very effective, durable and economical. He is now about to make the pump business a specialty on a large scale.

A Bottomless Well.—A man named Neff, near Alexandria, Huntington Co., Pa., found one day in August, that the bottom had tumbled out of his well. After making numerous experiments by letting lights and animals down the hole thus opened, he concluded that the air below was pure and ventured to explore the newly-discovered region himself. He found a cave extending for miles in different directions. Stalagmites and stalactites were numerous, and at intervals small streams of water ran over stony beds. Many bats fluttered in the cavern, and petrified sea shells abounded. A vein of nickel ore was also discovered, samples of which have been analyzed and found to be superior to the nickel of either Lancaster, Pa., or Germany, the only places where the metal is mined. Query: Who tells this story?

Williams, Colusa county, is to have a $10,000 flour mill.

Mines and Works of Almaden.—No. 1.

[Translated for the PRESS from "ANNALES DES MINES."]

Through the kindness of Mr. J. B. Randol, of the New Almaden mine, we are enabled to present our readers with an interesting memoir from the first number of the *Annales des Mines*, for 1878, upon the "Mines and Works of the Almaden Mine in Spain," by M. H. Kuss, M. E. The article has been partly translated by Mr. Ferdinand Fiedler, and it is our intention to give the translation in full, as many of our readers are interested in the subject. The article covers 100 octavo pages (in the original). The illustrations, some 16 in number, will be reproduced, and it will be well to preserve the copies of the PRESS containing it, as the whole comprises a monograph of much value to quicksilver men.

The present memoir will be divided into four parts:

1. Geology of the mines of Almaden.
2. Exploitation of the mines.
3. Metallurgy of mercury as practiced at Almaden.
4. Administration and history.

First Part.—Geological Description of the Deposits at Almaden. I.—Introduction.

The exploitation of the mines of Almaden dates back certainly to a remote antiquity; but the first notions at all accurate date from the middle of our century, and are due to a great extent to Casiano de Prado, of the corps of engineers of the Spanish mines. First, in 1830 he made a petrographic plan of the principal mine, he remarked the lines of stratification, and commenced to distinguish the different rocks. When he became, in 1841, director of the establishments of Almaden, he consecrated himself to this heavy task with indefatigable zeal, recollected even yet by some old mining captains, and did not abandon it until his health, undermined by the mercurial vapors, against which his zeal permitted no precautions, obliged him to renounce a post so dangerous.

After having occupied this place for two years, "without being able to think of the geology," as he himself says, and charged henceforth with duties less absorbing, he could, in 1846, publish upon the mines of Almaden a first work in which he described the deposits, ascribing them without other distinction to the rocks of transition *(terrains de transition)*.

Beudant said, about 1830, that the mercury of Almaden was found in the tertiary (*trias*). A little later, M. Leplay recognized in the Sierra Morena two rocks of transition, but without succeeding in establishing precise lines of demarcation.*

It was M. de Verneuil who was the first who seriously occupied himself in 1850 with the paleontological study of the Sierra Morena. After having collected a certain number of fossils, he did not fail to see that there had been two epochs. He could distinguish those which belonged to the silurian rocks and those which belonged to the devonian. A facile task, says M. de Verneuil, since in spite of the dislocations of the ground the silurian and devonian fossils are never found in the same beds.

There remained to be known the order of superposition of the beds and the disposition of the two rocks with regard to each other, to see if they existed there alone, to study the plutonic rocks, to find the epoch of the appearance of the cinnabar, and to look for the greatest possible number of fossils. It is this task to which M. de Prado devoted himself.

The researches that he made in 1852 to 1855, and which are recorded in the "Bulletin of the Geological Society upon the geology of Almaden, a part of the Sierra Morena and of the Mountains of Toledo, (Vol. XII., 1855), were undertaken to prove that the upper silurian system was only represented in the center of Spain, as an exception, and only by the schists of *Cardiola interrupta*, while for the most part the devonian beds rest immediately upon the lower silurian system, contemporaneously with the sandstone and schists of Lundeilo.

If the great space occupied by the ancient rocks in Spain give much interest to the fossils that M. Casiano de Prado has discovered there, one can say that the difficulties that present themselves in the way of stratigraphic study in this region add still more to this interest. In fact the foldings, the faults and dislocations which the crust of the globe has here suffered make it often very difficult, if not impossible, to render an account of the original order of superposition of the layers. Certain devonian strips seem to be intercalated in the lower silurian rocks, but as the fossils which they contain are the same as those in the devonian beds regularly superposed upon the silurian rocks, and as there is never a mixture of the fossils of the two epochs, the paleontologist pronounces without hesitation where the stratigraphist remains uncertain. In the presence of the convulsions to which Spain has been submitted, we can affirm that paleontology has furnished to geology an instrument more necessary than in any other part of Europe.

This extreme complication of the ancient rocks of Spain enables us to understand why their study has not been more advanced than it is to-day. The means of communication are so insufficient, the material conditions of life are so difficult in the Sierra Morena that geological researches are necessarily limited.

The engineers who have succeeded each other at Almaden were not all geologists, and besides were too absorbed in discharging their special duties to be able to occupy themselves much with scientific researches. On the other hand, the resources were for a long time deficient. The amount allowed the commission charged with the preparation of the geological map was very small, and it is only during some few years that they have been in a position to carry on regular work.

The actual state of knowledge then of the geology of Almaden is about the same as 20 years ago. M. I. de Monasterio, Inspector-General of Mines, published, in 1871, an account of the mines of Almaden in the *Revue Universelle des Mines*. This account, which has been resumed by M. Henry, M. E., in the bulletin of the *Annales des Mines* (seventh series, Vol. I., p. 443), was to have been completed by a study of the metallurgical processes, but it remains unfinished in consequence, no doubt, of the death of the author. It limits itself with regard to the geology, to the reproduction, in an abridged form, of the preceding note of M. C. de Prado. The development of the works has no doubt made known something new, but many questions are still in uncertainty, and without doubt will remain so for a long time.

We do not make the pretension, in the present work, of elucidating all the obscure points; our object is simply to expose the state of acquired knowledge of the deposits of Almaden. We have endeavored to extend it a little by an attractive study of the rocks which accompany the veins, and to arrive in this way at an approximate determination of the epoch of the advent of the mercury.

II.—Geological Situation and Constitution.

The town of Almaden is situated on the borders of La Manch and Andalusia in the Province of Ciudad Real, in the midst of a wild territory sparsely inhabited, upon the northern slope of the Sierra Morena. In traveling from Ciudad Real to Almaden by the railroad of Badajoz, one traverses at times long stretches of 15 or 20 kilometres (1 kilometre = 3280 feet, or about three-fifths of a mile) in the midst of mountains or hills covered with a meager vegetation, without encountering any habitation. The railroad stops at Almadenejos, where formerly were found mines of mercury, and from which a passable road runs to Almaden, situated 12 kilometres to the West. One cannot fail to be impressed with the sterility of the country. Valleys separated by little hills 100 to 200 meters (one meter equals 3.28 feet) in hight, a very sinuous stream with a slow current, dry in summer, but swollen during great rains. These are the principal features of the landscape.

The most notable character of the country, one that imparts to it a certain originality, is the presence of a great number of dykes of quartzite, which have resisted more than the other rocks the corrosive action of time, and which are formed in nearly vertical layers, resembling, from a distance, enormous walls, very high and capriciously carved.

The town of Almaden is situated in a valley, formed on the east by an insensible elevation of the ground, bounded on the north by the quartzite mountains of Chillon and of Peñarrubia, to the south by those of the Virgen and the Castilseras.

In the middle of the valley rises an elongated steep ridge, upon which the town is built; two rivulets, one north and the other south of the ridge, unite to the west, then run towards the south to escape by the depression existing between the chain of the Virgen and that of the Castilseras. (See Fig. 1, *Environs d'Almaden.*) Five kilometers to the north is seen another chain of greater length, but constituted like the preceding ones. Beyond that the same thing is repeated continuously. A section passing through Almaden north and south would give nearly the profile represented by Fig. 2. (See issue of next week.)

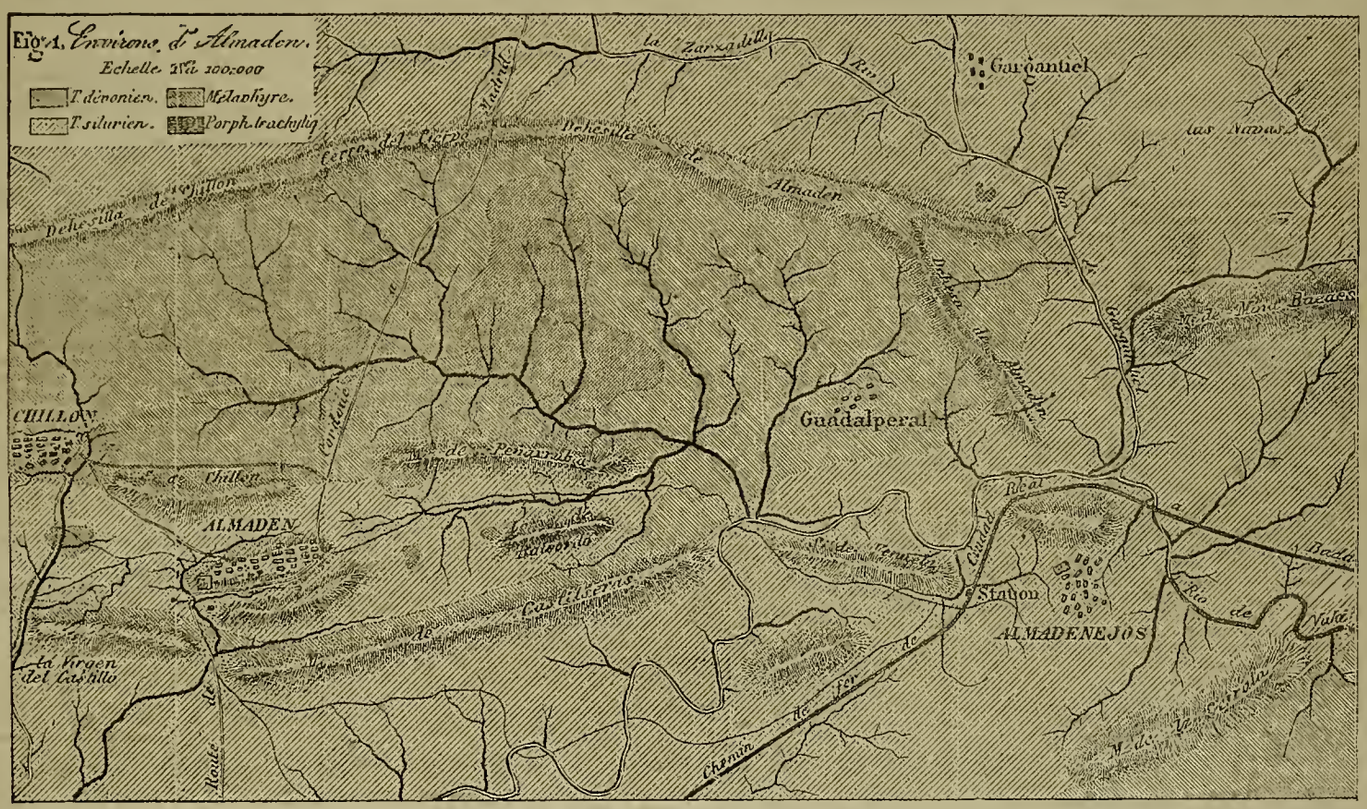
With regard to the rivulets which the map seems to indicate as abundant, it must not be forgotten that they represent slight undulations of the ground, and possible lines of drainage in times of abundant rains, rather than ordinarily existing rivulets. In summer there is hardly enough water for the mules and donkeys employed in transportation. The soil is not very productive; wheat is cultivated in the valleys, when the rocks are covered by a thin layer of vegetable mold, otherwise there is nothing but brushwood on the schists; the quartzite is absolutely barren.

Geological Constitution.

We reproduce on a reduced scale in Fig. 1 a manuscript map taken from the archives of the mine, on which we have marked the indications of the geological map of the environs of Almaden, published in 1855 by M. C. de Prado. This map shows that the predominating formation of the neighborhood of Almaden, as well as the rest of the Sierra Morena, is silurian. It rests on the south of the Sta-Enfemia on a massive granite, that of Pedroches, and is only interrupted from time to time by some devonian strata which are enclosed therein. Finally, diverse eruptive rocks, principally melaphyre and porphyry, appear at some points level with the surrounding country, which they do not seem to have disturbed.

To be Continued.

*See *Annales des Mines*, 3d series, Vol. V. p. 175, etc., and 3d series, Vol. VI., p. 297, etc., particularly p. 340. A set of the *Annales des Mines* can be found at the library of the University of California at Berkeley.



THE ALMADEN QUICKSILVER MINE.

A Worthy Project.

When a man feels called upon to aid some charitable work he naturally chooses that method which will accomplish most. For instance when a man buys a ticket to a concert to be given for the benefit of the yellow fever sufferers, he not only sends his money to the South, but in doing so he cultivates his own taste and encourages the art of music. It is this desire to kill as many birds as possible with one stone that has led to the following project:

At the request of the committee appointed to manage the Centennial celebration in San Francisco, a history of the city of San Francisco and incidentally of the State of California was prepared by J. S. Hittell. This book contains six chapters, dividing the history into as many eras, beginning with the times of the aborigines and extending down to the "hard times of 1877;" a seventh chapter devoted to "generalities"; and an appendix. A. L. Bancroft & Co. are to publish this book by subscription, the profits of the subscription sale to be given to the yellow fever sufferers and to the Catholic, Protestant and Hebrew Orphan Asylums of San Francisco, each object to receive the proceeds of subscriptions intended for its benefit. The book will be a large octavo volume of 500 pages, and the subscription price will be $5.00.

AT Bradford, Pennsylvania, Sept. 15th, a magazine containing 70 pounds of glycerine and 100 pounds of dynamite, exploded, killing four men.

SEPT. 4th, seven villains raided the mining camp of Cariboo, Idaho, securing $16,000 in gold dust, carrying off the good horses and killing the poor ones.

THE Russians have at last occupied Batoum.

NAMES AND EXHIBITS. LOCATION.

melon. 4 V

Meat & Fish Packing Co. "Ochsenmaul Salat," (preserved heeves' heads, tongues and palates). 3 T

Public attention has of late been directed to the ornamental pyramid on the main floor of the pavilion, composed hy the nicest glass harrels containing "Ochsenmaul Salat" (preserved heeves' heads, tongues and palates), exhihited hy the above named company, whose place of business is No. 736 Montgomery street. This fine delicacy and relish, has hut lately heen introdnced to our State, and already obtains the highest approbation of epicures and housekeepers. No family should he without it, for its convenience in emergencies more that compensates its cost.

Mendenhall, James M., Patent Gnte and two Models of Gates. 8 Y

This most ingenious and simple, self-shutting gate is npon the principle of an inclined plaue. The upper coruer of the front of the gate, and the lower corner at the hack or heel are supported by sheaves running upon iron tracks fixed on parallel inclined planes above and helow, so that the weight of the gate runs it down the inclined planes and closes it. The heavier the gate the quicker it shuts, and the more hoys elimh on it the closer it sticks to its track. It cannot sag nor stay open unless fastened so. His invention is also applied to douhle large gates, with levers and pulleys so arranged that a team driving through opens the gate as easily as a man can take his hat off. The invention was patented through the MINING AND SCIENTIFIC PRESS Patent Agency. Address James M. Mendenhall for county rights or information, Livermore, California.

Meild, R., Case Dulcimers. 1 *N*

Merrill, P., Model of Carpet Beating Machine. 7 V

Myers, S. E. B., Koumiss, Consumption Cure. 6 J

Koumiss, as it name implies, is of Russian, or rather Tartaric origin, and is that form in which mare's milk is most commonly used by that wild people, among whom no diseases are known, and who recover from wounds that are generally considered fatal in civilized countries. Its valuahle qualities as an antidote or conqueror of dyspepsia, liver eomplaints, and diseases of the lungs, has brought it into great repute in Russia, where it is now generally made of cow's milk, and has turned attention to it here. Mr. Myers undouhtedly possesses the secret of its manufacture, and his factory at No. 825 Capp street is daily being increased to accommodate the demand.

Nicoll, A., Cloths and Custom Made Clothing. 3 *T*

"Cloths and clothing" expresses a great deal, but when applied to such a display as that made by "Nicoll the Tailor," is entirely inadequate to do justice to the exhibit. It is very unfortunate that this should be the "off year" of the fair, *i. e.* the year in which no premiums are giveu, for Nicoll's display of goods in the fair deserves something more than mere entry in the catalogue. Were it otherwise, no mention would he made here of it more than that accorded to other exhibitors at the tair.

A careful examination of his stock, both at his place of business and in the fair, dcvclops the fact that it is all new goods, and of the finest quality of its hrand, of course heiug of different degrees o f fineness and price to suit the purchasing capacity of his customers, and yet all manufactured of the best raw material to he ohtained.

Speaking of raw material reminds us of the fact that experienced judges, like Nicoll, only can tell whether the best wool has really been used in the cloths they use. The wool may be fine and long, yet have a weak place in its center that makes it no better than short wool ot equal fineness. From his long experience in cloth weaving and working, Nicoll can at once detect this defect, and returns to first hands any goods sent him possessing this damaging material.

Importing from the hest toreign and domestic factories all the cloths he uses, and having a branch house in London to watch the markets, gives him the advantage of the newest goods, less the profits of two or three intermediate dealers, so that he can afford to sell his goods cheaper than most establishments of a similar nature in this city.

Now, coming to Nicoll direct bimself, it may be said that if he had not been hred a tailor he would have been a sculptor or an artist, for it requires the same faculty to measure, cut and fit, that it does to shape up in stone or plaster the beautiful rounded limbs of a Venus, or the massive sinewy form of an Hercules. Form is the phrenological term for this faculty, and its possession in a greater or lesser degree is what constitutes the difference in ability in the business we have under consideration. Ot course "color" has much to do with it, as assisting the artist either in oil or cloth to harmonize his effects, and suit the complexion of his customers. These two faculties possessed in a large degree, coupled with business talents and enthusiasm for his calling, is what has given Nicoll such a justly wide reputation in the higher circles of the community.

His fits are superh, and by skillfully lining the garments lighter or heavier, he corrects defects in form, or peculiarities of structure, so as to make a mau more of a man than he ever deemed himself to he hefore he submitted his shape to Nicoll's haud. Worth himself never had a harder task, nor acquitted himself with greater laurels than has Nicoll in some of his wrestles with round shouldered, crooked hacked, uneven humanity; and it is this ability to fit, no matter what the shape, that gives his work prominence in every gathering of well dressed citizens in this metropolis.

Employing only white help, and intelligent, skillful labor at that; and carefully superintending every operation, he is enahled to turn out suits at low prices that are the wonder and envy of his competitors. "How can he afford it?" say they. It all lies in just what we have said and may he summed up in short meter as, buying direct, selecting carefully none hut the best goods and employing none hut honest, skillful employes, selling at a moderate profit and giving just what you profess to on every order.

Leaving his exhihit at the fair, go to his es tahlishment, No. 505 Montgomery street, and see the extensive stock of cloths he gives his customers to select from: Scotch Cheviot that will turn the heaviest rain, English and French heavers that are as fine and soft as the down of the eider, Doeskins, douhle and single, that will outwear rawhide and always look nice, Diagonals that time has no effect upon, and are dressy from the first to the last, Broadcloths that seem to he made of the cloth of gold sheep of Spain's proud monarchs, all at prices that stagger dealers who don't know the secret of his purchasing.

"A man's a man for a' that," hut good clothes help every one in any walk of life, from courting to counting, from preaching to practicing, and to go with a cheap, poor suit on your hack to sue for a youug lady's hand, will nt once settle your case if she knows that "Nicoll the Tailor" is still in the trade.

The leading tailor of San Francisco for style; the most successful tailor in the State for business; the cheapest tailor in the city for good suits; the hest fitting tailor known to the world, and the hest stocked tailoring establishment on the coast, ensures Nicoll the best trade of any one in the business that can he named in a reasonable period of time. His large trade forced him to open a hranch at No. 18 Kearny street.

Nutting & Son, Scotch Tubular Iron Harrows, Iron Harrows on Wheels, Gang Plow with Slip Shear, Pat. applied for, Seed Sower. 4 Z

The harrows exhibited hy this firm are one of the practical improvemeuts in agricultural implements. Beside the advantage gained hy having the teeth inserted in a nou-shrinking substance, either wing of the harrow may he turned up to avoid and pass obstacles, and when on the road the whole harrow is raised hy crank levers upon wheels. The self-sharpening, slip-share gang plow is a new invention and will probably be a favorite. Fire-proof windows, girders, hank vaults, gratiugs and geueral iron work are also done hy this firm, who are sole manufacturers of patent metallic tubular wheelbarrows, at No. 121 Fremont street.

Phillips, J. S., Prospectors' Assaying Apparatus nnd Specimens. 4 O

Is the author and inventor of the following: Explorers', Miners' and Metallurgists' Companion, 672 pages, 83 cuts, 2d edition, price $10.50; the prospectors patent "Wee Pet" Assayer, $100; the Testing Machine for Gold, Silver and Lead, $40.00; Cahinet of Fluxes, etc., for these machines, $20; Pocket Lahoratory for testing nnd assaying, $50; Blowpipists' Sample and Buttou Weigher, $25; Vest Pocket Blowpipe, $3. This hook on mining is uuequalled. The "Wee Pet" received a gold medal trom this institution in 1869, and the other more recently invented tools for prospectors are as meritorious.

Plummer, C. B., Family Fruit Drier Case Samples. One model Factory Drier. 8 X

The ahove invention does away with the old style of fruit drying and inaugurates the reign of fast work and fine eatable fruit. A heavy iron furnace furnishes heat to several flues, which enter the hottom of the drier, and hy their heat creates a draft of cold nir, which passing up through the consecutive sieves of fruit, dries it out in ahout an hour, ready for boxing for market. Testimonials without limit certify to the capacity nf the family drier to he all it is claimed, nnd one old lady of 72 years tells ot running one herself to great profit. Its product has taken several premiums, as well as the invention itself. Address W. S. Plummer, East Portland, Oregon.

Plum, Chas. M., Carpets, Rugs, Window Drapery and Furniture. 2 *A*

Poheim, Joe, Cloths and Custom Made Clothing. 2 *Y*

At his establishments, 203 Montgomery and 103 Third street, Mr. Poheim has just received a large assortment of the latest style goods, which he is making up in first-class style for his customers at the low price ot $20 for suits, $5 for pants and $15 for over coats; and to the ever present and leading question "where can he found the best goods at the lowest prices," Joe Poheim the tailor, stands ever ready to say, "Here!" An examination of his display in the fair establishes his reputation for good work, and no more experienced or uhle tailor has ever clothed our citizens than he. Unexceptionahle fits, and excellent material and workmanship distinguish his clothing. Rules for self-measurement and samples sent free to any address.

Potrero Distilling Co., Compressed Yeast. 4 I

This valuable article is fast coming into general use, now heing kept at nearly all groceries, as a matter of course. In a cool place it will keep for a week, though the supply is sent around daily to all the depots. No hetter recommendation need he given it than the fact that all the principal restaurants use it. Each morning their train may be seen supplying the first-class establishments nlong Kearny and other principal streets. Always of uniform quality and strength, the hread cannot be otherwise than good, made with it, and has not the taste of hops, usually imparted hy hrewer's and home-made yeast. It is kept hy all grocers, and at the depot, No. 745 Market street.

Prescott, Scott & Co., Union Iron Works, Bahy Hoists and Engines. 8 U

The works of this firm are located at the corner ot Mission and First streets, and are very complete nnd extensive and well fitted for all kinds of casting and engine work. Among the machinery manufactured and on sale by them are Vertical and Horizontal, Cut-off and Compound Condensing engines, shafting, rock breakers, stamps, pans, settlers, retorts, self-feeders, etc., at remarkable low rates, of extra quality.

Sweetser & DeLong, Cider and Vinegar. 3 N

Those who have tasted the cider of the above mentioned exhibit in the Fair, know that it is pure and unsurpassed, and we can vouch for the extent of the orchard from which it comes. Very few care to sample the vinegar on exhibition hy them, but if housekeepers would only try it, they would at once order some for home use. It is the first-class article, pure and warranted to keep in any climate. Their boiled cider is just the thing for mince pies and sauces, and is sold by the gallon for family or saloon use, as well as cider and vinegar, at No. 117 Pine street.

Sweepstake Plow Co., Hill's Improved Eureka, Sulky, Grange and Steering Gang Plows; also Sulkies, Buggies and Wagons. 2 Y

The display of this company is one of the best and most instructive in the fair. Their iron wagon with Duval wheels, is something new and evidently strong. What a contrast would it make, having no wood about it but the pole and coupling, with an old-fashioned wagon having no iron about it but linch pins and tire! They also show a few other articles of their manufacture, including Hill's Eureka sulky plows, Grange and Steering gang plows, sulkies, buggies and wagons, in which latter industry they have lately embarked. Like all of their work, these are first-class, durable and well finished. The factory is located at San Leandro, Cal.

Strozynski, Stanislaus, Human Hair and Hair Dressing. 2 B
Swan & Brook, Illuminating Letter and Sign Painting. 1 D
Tatum & Bowen, Albany Lubricating Compound and Cups, Pat. Chisel Tooth Saws. 7 D

Their display of Hoe's patent saws, teeth and points is particularly fine and illustrative of the progress in this direction in the past decade. These teeth are the *sine qua non* of sawyers, and indispensable in mills that run for profit. The Albany lubricating compound was used on the crank pin of the driving engine of the fair, and was the only lubricator that would not heat on that place, They are also agents for Hoe's presses, country and city styles, drum and cylinder, with valuable recent improvements. All sizes of which they will keep in stock. Office, No. 3 Fremont street, corner Market, San Francisco.

Tay, Geo. H. & Co., Ranges, Stoves, Granite, Japan, Plauished and Tin Ware; Copper Boilers, Sewing Machine and Jig Saw Motor Power, Cheese Vat, etc. 2 F
Taylor, M. C., specimens of Chromite and Magnetite. 4 V
Taylor. S. P. & Co.. Printing, Blank, Hanging, Manila, Tissue Paper, etc. 7 R

Paper, in these days of cheap printing and many books, has assumed as much importance among civilized nations as with the Japanese, where it is used for building purposes and clothing. The above firm makes a fine showing of their capability in the line of paper making, and are competing successfully with the Eastern made article in our markets. Being pioneers and owning the Pioneer Mill, they have benefited by experience, and turn out a superior article in every line of their manufacture. A large stock of all sorts is always on hand at the warerooms, No. 416 Clay street.

Taylor, A. C., Excelsior Range and Gas Stoves. 8 Z

An inspection of Mr. Taylor's exhibit convinces any one that he is an ingenious mechanic, and knows what he is about. His Gas Stove is upon a new principle, economic and healthful in action. The ranges are provided with special connecting pipe, running from the outside around the lower part of the furnace up into the hot closet. The cold air enters this pipe, is heated in passing the furnace, heats the hot closet, and is released at will by means of a damper. His new broiler is an excellent article for saving the juices of steak, and his cake griddle is an achievement for the benefit of womankind. All should order these improved articles from his store, No. 816 Montgomery street.

Tustin, W. I., Irrigating Pumps. 8 J
Tyler, Mrs. Mary, Patch Work Quilt. 1 R
Van Blarcom, A. L., Southwick's Turbine Windmill. 8 S

The many claims of excellence made by the proprietor of the Turbine mill are certainly worthy of investigation. That they cannot be blown down is self-evident. That the fact of their being built upon the same principle as the Turbine water wheel, which we know to be the most economical use of water in a wheel, would establish their claim for light running or running on a lightsr wind than most others. Protected from the effects of the weather, they cannot but be more durable than any other in use. They are manufactured by A. L. Van Blarcom, Second street, between Washington and Broadway, Oaklnnd.

Vandenberg, Dr. J. P.. Tape Worms. 1 J
Van Wart, Wm. (Butte Co., Cal.) samples of Wheat. 4 V
Vogeley & Bro., J., assorted French Mixed Candies. 4 M
Vulicevich, M., Alligator Pears. 4 V

Waterhouse & Lester, Carriage Material. 2 N
Webster, J. R., Model of Wave Power. 7 M
West Coast Furniture Co.., Bed-room, Office, Dining Room and School Furniture. 4 Y

The beautiful furniture shown by this company elicit admiration from every one. Strength, beauty of wood, elegance of design and ornamentation, combine to render their products the finest of any establishment on the continent. The antique dining-room set, in oak, is complete in all its appointments, and carries us back a hundred years. The Toa wood set, panneled with French mahogany, is incomparable; and the Tomano furniture looks as rich as it is possible for wood to do. Primivera reminds one of the old butternut of the East, or white walnut. This company operate on a large scale, and can fill orders for furnishing hotels or private residences on short notice. Office and factory, corner Fourth and Bryant street, San Francisco.

Weed & Kingwell, Brass Work. 8 J

Messrs. Weed & Kingwell make a fine exhibit of a general assortment of brass goods, consisting of finished and rough bells, steamboat bells, steam gauges, whistles, oilers, and, in short, every variety of brass goods for steam engines and other purposes. It is scarcely possible to conceive of better work than these brass castings now on exhibition. Everybody who knows anything about this branch of manufactures is aware that great skill in metallurgy and chemistry as well as mechanical invention is necessary to complete success. All these requisites are possessed in abundant measure by Messrs. Weed & Kingwell, No. 125 First street.

Wheeler, S Carbon Engine. Engine Room
Willard, Z. A., Ore Roasting Furnace. 9 N

This furnece consists of a cylindrical chamber, which is made, according to its dimensions, of either wrought or cast-iron. This chember or retort has a falso bottom, somswhat on the principle of a Bessemer converter, which sspar-atss it from another chamber, into which a blast of air is blown. The false bottom is perforated in order to allow a finely-divided current of heated air to pass up into the ors to be treeted. The furnace is so arranged that charging and discharging are very easily performed, and the operation may, without difficulty, be made entirely automatic. The cheap and effective reduction of refractory ores is the most important problem that has presented itself to miners and millmen; for nearly every mining section has its full quota of such ore, the successful working of which would be sure fortune to hundreds of hard-working miners who are now struggling vainly to get the precious metel separated from the baser ors. We believe this has been at last solved satisfactorily by the invention above described. Mr. Willard has introduced his method without any special horn blowing, and quietly set it to work in the Pavilion and elsewhere, and has successfully treated some of the most rebellious ores, both arsenical and sulphurst, from Amador, Butte, Placer, Sierra and Tuolumne counties, and also the far-famed Meadow Lake ore, heretofore unconquerable. It is cheap, easily understood, more easily worked—for it works itself—durable, and has but little machinery about it. The plant is comparatively inexpensive. It is at work in the Fair every afternoon and evening, and miners and millmen will find it to their interest to call and examine its workings, which they are cordially invited to do.

Wilson Sewing Machine Co., Machines and Sample Work. 3 L
Wilson, T. A., Improved (Little Chief) Washing Machine. 7 M

This washer acts by atmospheric pressure. When the piston rises it fills with air; descending, the valve closes and the air is forced through the clothes, carrying the water and dirt with it. The driving of the whole is mere amusement for a child. The power can be detached when desired in two minutes, and used to drive a churn dash with equal facility and ease; with it a child 10 years old can do a 10-pound churning. Canvassers wanted. D. M. Jacott. Agt., 211 Polk st.

Wilcox & Gibbs S. M. Co., Automatic Sewing Machine and Work. 2 B
Woerner, David, Wine Casks. 1 W

This exhibit is one of the best ever made in the fairs of our State. The immense wine pipes are 11 feet high and 8 feet long, with concave heads and brass fitted man-holes, hooped and finished in the finest manner, and are models of strength and workmanship, as are also the small pipe and beer barrels. At his factory, No. 104 Spear street, every style and size of cooperage can be furnished at the shortest notice from selected stock.

Wood, Benjamin, Pat. Portable Houses. 8 Y
Woodward, R. B., Birds and Animals Stuffed, Tropical and Ornamental Plants. 4 Q

As has been his usual custom, Mr. Woodward comes nobly forward and adds to the attractions of the pavilion by exhibiting his beautiful collection of ferns and flowers, and a large case of taxidermical specimens. Not having them for sale nor expecting to derive any benefit from their exhibition, makes the display praiseworthy. The mounted specimens of beast, bird and reptile are very fine samples of what may be seen in much greater numbers at his gardens; and the richness of the ferns and few other plants shown are but indicative of what appears in much greater profusion at his conservatoire in the far-famed Woodward's Gardens.

California.—An Allegory.

At the invitation of Mr. Oscar Kunath we paid a short visit to the gallery where his picture "California" is exhibited. "California" is a queen of tall, masculine yet graceful and symmetrical figure. Upon her head is a crown of bright ripe cereals, clasped above the forehead by the royal jewel, a full blooming rose. A long, loose garment of cloth of gold, bound at the waist, falls gracefully to her feet, and over her shoulders and reaching also to the ground, is thrown an ample robe of regal purple. She stands firmly in the recess of a lofty weather-beaten rock. Behind her to the right tower two brother sequayas, just enough of which is seen to suggest, with the belp of the surroundings, the immensity of their hight. Further to the right and way below are the cliffs of the Yosemite. On her left a life-like oak lifts its branches, and in the distance is the Golden Gate, not so far hut that the guardian fort can he distinguished. Through the Gate rolls the Pacific, stretching away to the dim horizon. Back from the horizon and reaching up the western sky, spreads a vast sheet of veritable summer clouds, overcharged with flowing wealth for her kiugdom. In front of the Queen and to her left lies a grizzly, his paws folded comfortably beneath his chin as he reposes. At the right of the Queen the rock rises a few feet to form a barrier between her and the vast, deep valley beyond, a sort of arm to her throne. Down this rocky arm, and covering it, a grapevine trails. Where the vine reaches the more level rock, and reaching around in front almost far enough to disturb the bear, there are piled in careless profusion the fruits of the kingdom. There are white grapes and purple, the apple, the peach, the plum, and representatives of semi-tropic as well as temperate climates. Below the fruit is heaped the more substantial though less prepossessing product of the mines. The malachite and cinnabar attract the eye by their colors, hut a second, more thoughtful glance, finds worthy occupation in studying the less showy pieces.

Standing upon the throne in the midst of her dominions, "California" makes but one motion. She strctches her right arm out ovcr these her treasures. The attitude is one of majestic command, and if her countenance showed less voluptuousness and more of forcible intelligence, her extended arm might symbolize progress as well as unbounded control. It is our State in her stretch of territory, her resources and wealth, that "California" represents. As au allegory, it is as successful as it is interesting, and this is paying it a high tribute.

Woodward's Gardens were never more attractive than at present. Besidea three liona already mentioned, six monster living alligators, aeveral iguanas and a boa-constrictor have just been added. New stars are conatantly engaged for the Pavilion exercises. Ratea of admission as uaual.

UNION READING ROOMS, FIRST STREET, SAN JOSE. WELCOME TO ALL!—Having lately been removed to the old hall of the City Zouaves, this institution is located in a pleasant and spacious apartment. The latest and best eriodicala of the day are found on its tables, fres to all. Alao many eboice volumea upon its shelves. Good music is provided for every Wednesday evening's social. Admiasion [to these entertainments, 25 ceuts—to pay expenaes.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (83) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

Gover Mining & Milling Company.—Lo-

cation of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the ninth day of August, 1878, an assessment (No. 37,) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin or legal currency of the United States, to the Secretary, at the office of the Company, Room 8, No. 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid, on Monday, September 23rd, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, October 21st, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

W. O. WILSON, Sec'y.

Office, Room 8, No. 402 Front Street, San Francisco, Cal

Keystone Quartz Mining Co npany.—Prin-

cipal place of business, San Francisco, California. Location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of August, 1878, an assessment of fifty (50c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at the office of the Company, northwest corner Pine and Sansome streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of October, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-eighth day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Hackberry Mill and Mining Company.—

The regular annual meeting of the stockholders in the Hackberry Mill and Mining Company, for the election of five Directors to serve during the ensuing year, and for such other business as may properly come before the meeting, will be held at the office of the Company, No. 300 Clay Street, San Francisco, Cal., on Monday, the seventh day of October, 1878, at the hour of 12 o'clock noon.

ED. B. PARTRIDGE, Sec'y.

Mariposa Land and Mining Company of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, California.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 14) levied on the tenth day of July, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Directors, made on the tenth day of July, 1878, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, Room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, California, on Monday, the ninth day of September, 1878, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. LEANDER LEAVITT, Sec'y.

Office, Room 33, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

POSTPONEMENT.—The above sale is postponed until Wednesday, the twenty-fifth day of September, 1878, at the same hour and place.

By order of the Board of Directors.

LEANDER LEAVITT, Sec'y.

Orion Mining Company.—Location of Prin-

cipal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sausome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and

unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors,

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Pocahontas Gold Mining Company.—Location of Principal Place of Business, San Francisco, California. Location of Works, El Dorado County, Cal

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of August, 1878, an assessment (No. 14) of One Dollar and a Half ($1,50) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 9, 411½ California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23rd day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on Wednesday, the 23rd day of October, 1878, to pay the delinquent assessment, together with cost of advertising and expenses of sale By order of the Board of Directors

M C SOUTHARD Sec'y.

Office, Room No. 9, 411½ California street, San Francisco, California.

South Comstock Consolidated Silver Mining Company.—Notice.—A meeting of the stockholders of the South Comstock Consolidated Silver Mining Company will be held on Tuesday, the 24th day of September, 1878, at 2 o'clock P. M., at the office of the Company, Room 4, second floor, No. 309 California street, San Francisco, California, to adopt a Code of By-laws for the government of said corporation and its officers.

J. M. BUFFINGTON, Sec'y.

San Francisco, September 0th, 1878.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D., 1878, an assessment, (No. 5,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on the nineteenth day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee	30	437½	$218 75
Louis McLane, Trustee	32	½ of 875	218 75
O W Grayson, Trustee	62	1312½	656 25
H H Shinn, Trustee	01	400	200 00
H H Shinn, Trustee	02	400	200 00
H H Shinn, Trustee	03	400	200 00
H H Shinn, Trustee	04	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

DEWEY & CO.,

Publishers, No. 202 Sansome street, San Francisco.

FIRE! FIRE!! FIRE!!!

ENGINE FOR SALE.

A first-class, large sized Britton Firo Engine, in fair order is offered for sale cheap. Price, $400. It is worth more than double that sum. About forty men can work on the brakes. Towns or corporations wishing a good machine should examine this engine before ordering elsewhere. Apply to

ROOT, NELSON & CO.,

Union Foundry, Sacramento

J. HEPBURN,

Mechanical Draftsman and Engineer

No. 214 Sansome Street, (Room 29,) S. F.

Working Drawings Furnished. ☞ Premium obtained for Designs furnished the city for proposed Steam Fire Launch.

SUMMER RESORT.

Exhiliarating Climate! Grand Scenery!!

☞ Persons intending to spend a few weeks in the country during the summer months should stop at the Bridge House, on the South Yuba. Accommodation may be had for a few more boarders by addressing Mrs. R. H. CULBERTSON, Emigrant Gap. House only one mile om the station.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co.,	Con. Virginia M. Co.,
Crown Point M. Co.,	California M. Co.,
Belcher M Co.,	C. & C. Shaft,
Yellow Jacket M. Co.,	Utah M. Co.,
Sierra Nevada M. Co.,	Ophir M. Co.,
Silver Hill M. Co.,	Mexican M. Co.,
Sutro Tunnel Co,	Overman M. Co.,
Gould & Curry M. Co.,	

REYNOLDS, RIX & CO., Agents.

18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

The Only SAFE BOILER.

SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,

18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,

18 & 20 Fremont Street San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 05 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 2 50
One man, per day	3 00
Wood, 1½ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

JUDGE WM. WEBSTER, Paymaster Mine, Reno, Nev.

LEWIS CHALMERS, Manager Exchequer and IXL Mines, Silver Mountain, Cal.

J. S. CONE, Vice-President Tchama County Bank, Red Bluff, Cal.

For further information, apply to

D. J. O'HARRA, Reno, Nevada.

SUSPENDED WIRE ROPE TRAMWAYS.

This system of transport is peculiarly adapted for the carriage of minerals over rough countries. Heavy gradients and long spans easily overcome, and cheaper than by any ordinary means.

Transmission of Power by Wire Ropes.

The power of water or steam can by this means be carried for long distances, with great economy.

For estimates and practical information apply to

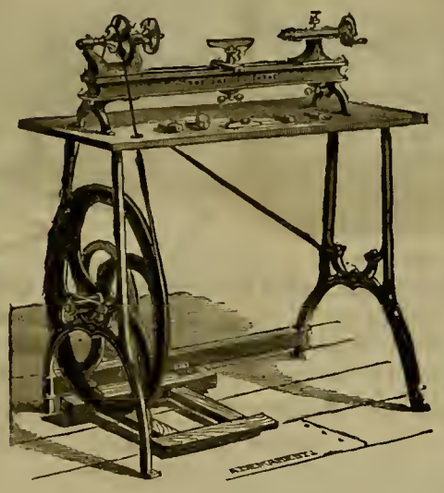
THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone-pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur center for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

San Francisco Pioneer Screen Works,

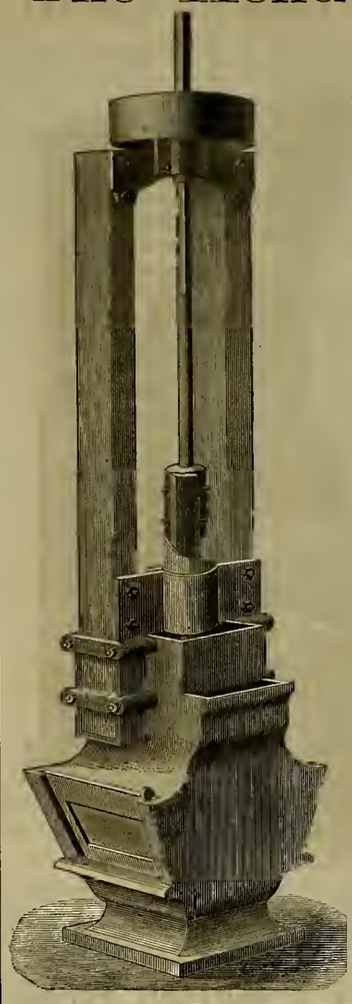
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

The Kendall Battery.

STEPHEN KENDALL, Patentee.



This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

Rankin, Brayton & Co.,

MANUFACTURERS,

Pacific Iron Works San Francisco.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1¼ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12 Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-

brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

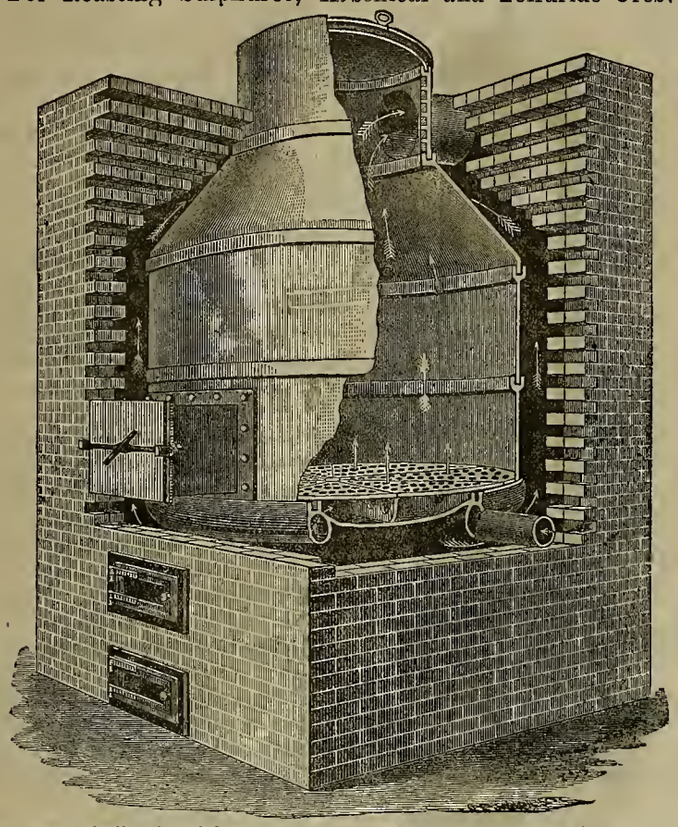
Office and Manufactory, 130 BEALE STREET, San Francisco, Cal.

Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arseuical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 28, 1878.

VOLUME XXXVII Number 13.

New Apparatus for Mounting Theodolites in Mines.

The use of the tripod for mounting the theodolite in mines is connected in many cases with difficulties, and is, therefore, unpractical. In the mines of Virginia City, where work must be done in hot and badly ventilated places, and where it becomes necessary to rub the body frequently with ice to prevent fainting, it is difficult to do scientific work. To facilitate such work, Ernst Koch, Surveyor and Assayer of the Sutro Tunnel Company, has constructed the following apparatus (see Fig. 1 and Fig. 2) for mounting the theodolite more easily and more quickly than by the use of the tripod:

The apparatus and the theodolite are fastened by a wooden screw, *i*, Fig. 1, to the roof of the tunnel or level, either to the timber or to a small wooden block in the rock. The theodolite is moved by screws *d* and *c* horizontally, and by screws *h* and *k* vertically, under the plumb, *b*, suspended from the center, *c*. The theodolite is slid and turned near to the center by the hand on *e*, which is round, and is then fastened by screws *a* and *d*; by turning screw *d* the theodolite is moved close under the center, *c*. The rod, *e*, is fastened to the slide box, *f*, at the axis, *g*. The slide box is moved up and down by screw *h* to bring the theodolite close under the plumb. The screw *k* serves to bring *e* and the theodolite at right angles to the plumb, *b*. In inclines and shafts the theodolite is fastened to one side of the shaft by screw *i*, Fig. 2, which is connected at right angles with *h*. The rest is the same as described above. The observations are not disturbed by cars passing underneath. In case the cars are too high, the screw *l* is moved 180°, and after they have passed, is moved back again, causing no delay, while the use of the tripod necessitates the stopping of cars and of work. The above described apparatus will prove time-saving and accurate.

The Little Wonder.

This is the name given by J. S. Phillips to a new invention of his lately exhibited at the Mechanics' fair in this city. It is a self-calculating sample and button weigher, for prospectors who can use the blow-pipe. It is devised so as to combine extreme lightness and delicacy of weighing with portability and self-calculation. It weighs less than one-fourth of a pound, the pointer turns a half inch with a hundredth of a grain in the pan. One who cannot even read figures may value the percentage of base metals, the thousandths fine of bullion, and dollars per ton of both gold and silver rock. It has two beams for weighing the sample and the resultant button, with a full set of suitable weights. The whole packs in a spectacle case. The prospector in his trip may find a richer, but never a more concentrated bonanza than this little pocket companion.

GOOD PROOF OF MINERAL LAND.—One of the most coveted exhibits at the recent State fair was "small but hefty." We allude to $1,000 worth of nature's gold specimens, varying in value from $2 to $70 each, from the mine of A. J. Blakely, on the Jack Johnson ranch, near Placerville, El Dorado county. The specimens about filled a good sized tea saucer. Four thousand dollars was the result of 30 days' hydraulicing. A yield of $12,000 has been taken from the mine at an expense of $1,500. Mr. Blakely had some difficulty in proving to our Government officials that this land was more valuable for gold than agriculture, but persevering he triumphed, as above indicated, in proving his claim to be substantial. We understand he is succeeding well in making some good farming land after it has been worked for minerals.

AT Forest Grove, on the line of the Oregon and California railroad, fire destroyed 50,000 bushels, September 13th.

Wanted—More Capital.

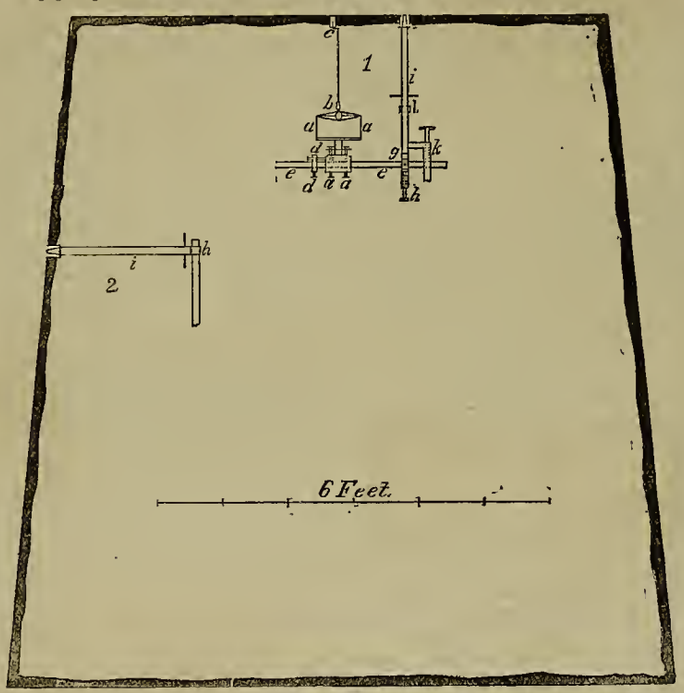
When the first "mining correspondent" wrote his first account of a visit to a mine, there was invented the expression, "We have no doubt that in a very short time, developments will be made here that must gain for this mine a reputation rivaling that of the ancient Ophir." That is the formula for a mine in progress. If the mine is an abandoned prospect hole, the prescription is altered and the correspondent writes, "All that this region wants is more capital. Cannot you turn the attention of capitalists in this direction?" These inventions have proved of such convenience that they remain in general use even unto this day. Each newspaper, wherever published, sounds high the praise of its own region and ascribes dull times to want of capital.

When papers published on our coast declare the mineral richness of their particular districts, we believe that they do not exaggerate. When experienced and judicious men write in glowing terms of the undeveloped placer resources of southwestern, as well as southeastern Oregon; when Idaho papers say that 100 men might well find employment in Idaho diggings, where now but few are at work; when sober accounts come of what might be done in, as yet, hardly prospected parts of Nevada and Arizona and the south of California, considering their general tone and remembering what has been already accomplished in most unpromising regions, we feel inclined to believe them and to think that men are very foolish to concentrate their energies so fully on but two districts, the Comstock and Bodie. But when all the undevelopment is laid at the door of capital, an objection may be justly raised. Capital is generally very quick-witted and alive to any chance for profit. And if capital does not find its way to any worthy mining locality, it is because the miners themselves are not energetic enough; in first, making unmistakable developments, in other words, getting something to show, and in next making known what they have found.

A visitor to the Silverado mines, in Los Angeles county, in writing to the Anaheim *Gazette*, touches the point exactly. He says: "The great want of the district is a mill, and unless one is speedily erected there will be an exodus of miners. On the other hand, the capitalist could hardly be expected to invest his money in a mill until the mines are better developed, and the sooner the Silveradoans recognize this fact the better it will be for them. There are probably a hundred locators who, having made a few feet of hole, just sufficient to show a vein of silver ore, are now sitting down, awaiting the building of a mill before they take any ore out. These people should remember that before capitalists can be induced to invest in a mill they must be fully satisfied that there is sufficient ore to keep it at work."

Reclaiming Shifting Sands.

In this State, as in many other parts of the world, it would be of great value to chain down the drifting sands on the sea coast by the introduction of effective vegetation. The encroachment of these barren areas grows apace upon the valuable coast soils. In the Golden Gate park in this city a good measure of success has been attained with lupine. We notice that our Australian exchanges are discussing the question and report some successes with plants which we believe have not been tried in this State. In places where it is found impossible to exclude cattle, they say that the robust kinds of perennial *mesembryanthemum* will be found very efficacious in restraining sand. The plants delight in the vicinage of the ocean; they will grow either on loose sand or on the bare subsoil left after the passage of the sands; in the one case they fix the sands, and in the other they not only cover the bare and unsightly earth, but gradually, by the arresting of particles of sand and by the decay of their leaves and stems, form a new and rich vegetable mold. In the shelter of their trailing stems the winged seeds of *Pomaberis ericifolia* find a lodgment and an aid to germination, as also to the seeds of clover, and especially of prairie grass. An exceedingly valuable grass for the reclamation of sands unprotected from cattle is *Elmus arenarius* or Sea Lyme grass—a very hardy littoral grass, which grows extensively on the coast of Sussex, in England. It has been tried in Taranaki, and is looked upon as a very valuable grass for reclamation purposes. It is not eaten by sheep, horned cattle, or horses; it will grow in the bleakest spots and within reach of the sea-spray; it forms great tufts of herbage from four to five feet high, and by its matted roots arrests the sands. Although it seeds pretty freely it does not readily propagate fresh plants on very bleak hills, on account of the seeds finding no lodgement, but being driven clean away by the winds. The evil is remedied when the plants have become sufficiently plentiful to form a shelter. At first it is necessary, therefore, to raise plants from seeds in a nursery and to plant them out on the hills when they have attained sufficient maturity, or, as the mature plants will bear division, to plant out stolons in rows, in damp weather.



KOCH'S THEODOLITE MOUNTER—SECTION OF SUTRO TUNNEL.

The Mines and the Courts.

Judgment was rendered, September 19th, by Judge Daingerfield in favor of J. H. Moriey and against the Cleveland and Sierra Hydraulic mining company for $10,000 on a promissory note.

J. H. Gilman recovered judgment in the Twelfth District Court against the Almaden Consolidated quicksilver mining company for $585, for services rendered.

In the Nineteenth District Court, September 20th, in the case of George H. Faulkner, who asked for judgment against the McCracken mining company for $6,400, alleged to be due him for 1,619 shares of stock owned by him, but which were not delivered, the motion was denied.

In the suit of Lucy A. Fisher vs. the Ophir silver mining company, the demurrer has been overruled. This was an action to recover $1,000 damages, alleged to have been sustained by the plaintiff by the refusal of the defendant to transfer 20 shares of stock and mutilating the shares. Judge Wheeler failed to perceive how there could be any loss by the mutilation of shares of mining stock. He had heard of mutilated expectations on the part of people who dabble in stocks, but he could not discover that the plaintiff had suffered any. However, he would, in the meantime, overrule the demurrer.

W. T. Burns, H. B. Luther, J. H. Job, C. A. Kyle and A. D. Williams have, by their attorneys, S. S. Grass and M. S. Bonnifield, brought suit against William A. Rodefer, Daniel Muffley, S. B. Palmer, L. H. Morse, A. L. Washburn, Ferd. Bauman and O. P. Crawford to recover possession of a certain mining claim in Mount Rose district, called by plaintiffs the Mutual and by defendants the Grand Bullion mine, and for damages. The property, which consists of 1,500 feet of mining ground, is represented as being the most valuable in the Paradise mines.

In the Twelfth District Court, James Neall has brought suit against the Union Con. silver mining company to recover $25,000 on 250 shares of the capital stock of the company, which he cannot get hold of, as he complains that the defendants refuse to issue the same to him.

BULLION SHIPMENTS.—Hillside, Sept. 19th, $5,500; Northern Belle, 16th, $4,045.17; 18th, $4,046.41; 21st, $4,324.59; Standard, 16th, $18,947.56; Bodie, Sept. 16th, $14,000; Sept. 21st, $13,400; total to date, $152,218; 23d, $14,000; Leopard, Sept. 18th, $8,816.64; Hussey, Sept. 18th, $7,393.31; Con. Virginia, Sept. 21st, $54,049.41; total to date, $106,254.35; California, Sept. 21st, $68,523.84; total to date, $148,814.91; Tybo Con., Sept. 16th, $8,140.49; Hackberry, Sept. 23d, $13,000; Independence, Sept. 23d, $11,000; Indian Queen, Sept. 16th, $4,221.98; Black Jack, Sept. 23d, $6,102.19; Christy, Sept. 25th, $5,363; Manhattan, Sept. 24th, $11,600; McCracken Con., Sept. 23d, $8,600.66.

IT is reported that river-bed gold diggings, panning $20 per day to one man, have been discovered about 30 miles from Snohomish, Oregon.

DURING the week ending September 20th, 25,380 pounds of quicksilver and 62,259 pounds of sulphur have been shipped from Calistoga to San Francisco.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Virginia City.

EDITORS PRESS:—There is no place on the Pacific coast, or perhaps in the world, where can be found in greater abundance or more varied, material out of which to compile a letter to a mining journal than Virginia City; but there are so many reporters and correspondents always on the alert for news, that every strike, every little alteration, or even the slightest change in the mines, is seized upon and ventilated in the daily papers, and almost forgotten long before a letter in the ordinary course could be published. Hence the difficulty of writing anything to interest the general reader. There is, however, no place in the world of the population of Virginia City possessing as many interesting and peculiar characteristics. It has all the features of a great metropolis, hotels, stores, places of amusement, churches, clubs, banks, four or five daily journals, foundries and machine shops, a railroad with 32 arrivals and departures daily, water works superior to that of any other city in the world, furnishing an abundant supply of pure, soft water, direct from the springs and snow-fed streams of the Sierras; an active an efficient paid fire department, which, with the abundant supply of water always assured, gives to the citizens a feeling of security against any more such destructive fires as have heretofore devastated the city and temporarily crippled the energies of this most wonderfully recuperative people. All this is the outgrowth of less than 20 years, and that, too, notwithstanding its location on the steep side of a bleak mountain, where all is barrenness and desolation. It is a "city set on a hill," or rather on the side of a mountain, being situated on the eastern slope of Mount Davidson. The population is about 25,000 in Virginia City proper, and, as written by a prominent journalist of Gold Hill, "it contains more millionaires than absolute beggars, and still it is an exotic, sustained and enriched solely by its mines. Its every luxury, and it has as many as any other city, is brought from abroad, for nothing is indigenous on the Comstock save silver and gold."

The Stock Market

Is to-day the great excitement. Stock gambling, the prevailing mania, in which all are engaged. Everybody is getting rich, not by the old process of the daily aggregation of small sums by constant application to business and economy, but by wild speculation. C street is crowded from early morn until late at night by great crowds of anxious dealers, peering into the windows of the stock brokers to catch sight of the first appearance of every bulletin from the stock boards in San Francisco. The city is full of strangers from the East and the West, who have come here to take a look into the mines and invest their surplus cash. Hundreds of old Comstockers are daily returning to their old love to share in the rich spoils of the new discoveries; and, altogether, the hotels, and the saloons, and the streets, again present all the hustle, animation and excitement which so distinguished the city during the memorable birth of the bonanzas three years ago. The feeling is that another bonanza has been developed in the Sierra Nevada, which extends into the Union Con. and the Mexican, the Ophir and the North Con. Virginia, the Utah and perhaps the Scorpion, and that even little Wells-Fargo is not without hope; and that another fine crop of dividends can be seented in the near future, which will revive business of all kinds, furnish work in abundance to the laborer, and maintain the present remunerative wages; that other stocks from sympathy if not from merit, will most surely advance in price, and, in short, that the flush times of other years are about to be repeated.

The Mines

Do certainly give strong indications of great improvement. The Sierra Nevada has no doubt developed a bonanza equal if not superior to the celebrated Con. Virginia and California mines, which in the aggregate have produced over $200,000,000. The mines in the immediate vicinity, it is supposed, will all he profited by the "find," as they now know just where to look for the ore body.

The bonanza mines are preparing to resume dividends. The shaft of the Con. Virginia will soon he repaired.

The Gould & Curry and Best & Belcher folks are preparing to sink a joint shaft some 2000 feet east of the present hoisting works of the Gould & Curry.

The combination shaft of the Savage, Hale & Norcross and Chollar is down 2,300 feet. The original contract is for 3,000 feet, which from present indications will be accomplished without difficulty. They have encountered no water yet to seriously retard their work, and no pump has yet been used. The water so far has been hoisted by bailing buckets and the "skeets." The "skeets," the invention of I. L. Requa, Superintendent, is a self-dumping iron tank, made of boiler iron, water tight and of the capacity of five tons of rock. In this tank is brought to the surface a large portion of the water encountered. The pumping machinery is all on the ground and will soon be put in place. It will be the most powerful pumping machinery on the lode. There will be double pumps with two lines of 15-inch pump columns. Four of the huge balance bobs are already in, and four more are completed and ready to be lowered as soon as the stations are cut out. The great bob at the surface is already in place. Four new boilers are being set and will soon be ready for use. This shaft has been sunk so far by hand. They have used no Burleigh drill or other power drill, which for a work of such magnitude and which has been prosecuted so rapidly and successfully, displays great ability in the management.

The Pioneers

Of this city celebrated Admission day on the 9th inst. in a style characteristic of this peculiar community. It reminded one of an immense family enjoying a harmless jollification, or a great Christmas dinner. Everybody seemed to know everybody, formality and stiffness dispensed with, and every one having a good time. This immense gathering of the clans was presided over by Col. Bob. Taylor, assisted by Bob. Lowery and Bob. Lindsay, a triumvirate of witty and eccentric geniuses, and denominated by the citizens the "three Bobs." There was no programme of exercises, but the senior Bob. drew upon the audience for talent. Whenever a gentleman or lady was called, if he or she did not immediately respond, a sergeant-at-arms was sent for the delinquent. Among the speakers was Col. Taylor, Mr. Loomis of the Gold Hill *News*, Judge Aude and Calhoun Benham. The other exercises were music, vocal and instrumental, and recitations, which were very creditable, the exercises winding up by a grand jubilee chorus, under the leadership of that hardened old sinner, Bill Gibson, of Gold Hill. After the exercises were concluded a sumptuous repast was spread, consisting of everything good, including immense paus of pork and beans, done in '49 style. All were invited. The pioneers, with their characteristic liberality and improvidence, had furnished "grub" for thousands, with wine and beer enough to float a ship. After supper the hall was cleared and the juniors continued the entertainment, enjoying the light fantastic until morning, the "old boys" retiring in good order.

Sharp Practice.

B. F. Sturtevant, manufacturer and patentee of steel pressure blowers, Boston, Mass., published two catalogues of prices, bearing even date, January 1st, 1878. In one catalogue the price was more than 100% greater than in the other. The Superintendent of a prominent mine in Gold Hill ordered one of the blowers, No. 5, marked in the catalogue, which he had received from the manufacturer, with counter shaft, at $70. In due time the blower came to hand with bill and another catalogue, price of blower $130, and counter shaft $45, making $175 for what the Superintendent supposed he was buying for $70. What can be the object of the manufacturer in publishing two catalogues of prices for the same goods, unless somebody is to be swindled? Perhaps the manufacturer or his agent in San Francisco can explain.

W. G. A.

Virginia City, Sept. 12th, 1878.

The Stonewall Jackson Mine.

An Account of the McMillan Co.'s Property in Globe District, Arizona.

EDITORS PRESS: I was recently afforded an opportunity of going through the underground works of the above-named mining property, and will try to give in part a plain description of the new bonanza. I say in part, for it is scarcely possible for a person who goes into a particular mine for the first time to ascertain with perfect accuracy what is ore and what is waste. He must judge to some extent of the reliability of those who show him through the works, and in addition to an intelligent use of his eyes, he must not be backward in asking questions. If, at his leisure, he is able, by a sifting and reasoning process, to form a tolerably accurate estimate of the future of a mine by what he sees when it is only slightly developed, he will be able to do so in some measure from experience acquired in other mines, aided, perhaps, in a slight degree, by a kind of mining instinct, which it is not well always to disregard.

Until a few months back the so-called Stonewall Jackson mine consisted of a spar-vein ore "feeder," yielding slabs of almost pure native silver, from one and one-half to two inches in thickness, accompanied at times with several inches more of high grade spar or chloride ore. These slabs generally adhered tightly to the country rock, which was a compact, greenish syenite. Except for the ready money it gave to the owners by the sale or reduction of its singularly pure metal, the highest grade of which yielded from $8,000 to $14,000 per ton, there was nothing in this spar itself that justified great mining developments or financial expectations. As a harbinger or indicator of a coming mine of vast wealth near at hand, the practical miner looked upon it at the depth of from 80 to 100 feet, with a strange, fascinating interest. Like the blossom-bearing twig of a submerged tree, it not only told something of the species of the parent stem, but of the vigor it possessed at its invisible root.

The spar, it had been noticed, from the time of its discovery, branched out obliquely from a very large lode of yellow spar, which assayed only a few dollars to the ton. In following the metal downward upon the small vein, an incline had been opened 125 feet deep on the southwesterly or foot-wall side of the mother lode. After Mr. G. N. Freeman became Superintendent, a main shaft was started on the northwesterly side of the large vein near the summit of the hill and opposite a point about 100 feet further to the northeast than the spur incline. As this shaft was carried down it penetrated the lode, pitching toward it, and at the depth of 130 feet a crosscut of 14 feet exposed the footwall. At the same time a tunnel, or cross drift, was run toward the main lode from the spar incline and reached the foot-wall after passing through 37 feet of hard syenite. At both points the foot-wall was found smooth and solid with an inclination to the northwest of about 70°. To secure good ventilation a level was opened along the foot-wall, and now for 150 feet it is exposed and shows, for the entire distance, a selvage of clay, occasionally carrying rich ore, varying from 15 to 30 inches in thickness. Opposite the spar vein incline the crosscut has been extended into the lode for 50 feet without coming to the hanging wall.

As to the grade of the ore and its extent, a few statements will suffice. For three feet next the foot-wall there are places extending for six or eight feet at a time along it, where, without any special assortment, the ore will average $3,000 per ton. Farther into the ledge, for a distance of from 9 to 11 feet, the ore is of good quality, though not equal to that found for the first three feet. Imbedded in this as well as in lower grade ores at other points, there are bucketfuls or hunches of black sulphurets found which assay from $10,000 to $14,000 per ton. Still farther into the great vein the ore is poorer, and though the mass will not pay as it comes, it contains considerable good ore, which can be assorted out with advantage. What little ore is being extracted in opening the mine is divided into three classes, the first yielding from $3,000 to $14,000 per ton; the second from $200 to $1,000; and the third from $50 to $200. Of the last it may be said that, as nearly as can be estimated by a single visit and by the statements of reliable parties, there is a very large supply at command.

Below the level I am referring to, a winze has been carried down 40 feet on the clay, following the footwall. The vein continues quite regular and for 25 feet down has rich ore. Below that point, in getting near to the water line, the ore is of low grade. What the mine will be at the depth of 500 feet it is hard to estimate, but judging from present indications, it will far surpass, at least in the grade of its ore, either the Consolidated Virginia or California mines. One little chamber pointed out to me, measuring about 18 feet long by nine feet wide and 12 feet high, yielded sufficient ore to produce $50,000 in coin, and there seems to be a good deal more of the same kind still in sight. The ore is very deceptive when looked at in a cursory way. On the dump near the whim shaft there is a pile of reddish, rather clayey looking stuff, which a stranger would think contained very little; but when a piece is broken and every seam displays a thin plate of almost pure silver, the opinion formed at first undergoes a speedy change. That dirty-looking ore, according to the reliable statement of Mr. J. L. Clark, the Assistant Superintendent, has an average value of $3,000 per ton, and he showed me good-sized pieces that I know would assay twice that figure.

I learn that a muddled mining critic in San Francisco has tried to gain for himself a temporary notoriety by saying that the large Stonewall lode was only a "mud vein." If I am correctly informed, he is the same erratic genius who made the ridiculous assertion that the Silver King mine, in Pioneer district, was an egg-shaped deposit, found in a sandstone formation, which would furnish excellent material for grindstone disks. He was right, however, for once in his checkered life, when he spoke of the McMillan company's great mine as a "mud vein." A larger proportion of it than of any ledge he ever saw will go into amalgamating pans in the form of mud, and it will be found then to have a remarkable affinity for quicksilver, preparatory to its becoming the very kind of "mud" which margin brokers delight to handle. If the allusion was to the spar, which at the surface is the gauge of the lode, it is only necessary to say that some of the best mines of the country have spar ore bodies. But the Stonewall Jackson spar is changing as depth is attained and below the water-line is likely to be all quartz. The ore extracted from the Hannibal mine, on the same lode, is in quartz rock and of a soft, fine grain, very like Comstock quartz at that.

The mine is evidently well managed by practical mining men. Mr. Freeman does not pretend to be a miner himself, but his Assistant Superintendent, Mr. Clark, has had experience in mining works, and under him is a good, square foreman, Mr. Dodge, who will carry out the Superintendent's wishes effectively. At the close of last year a stranger could not go near the mine without subjecting himself to almost certain insult, even if he offered no provocation whatever. Everything is changed now. From the blacksmith, if no other person is around, up to the Superintendent, visitors will at least receive courteous attention, even if their wishes as to getting access to the mine may not in all cases be complied with.

JOHN DARE EMERSLEY.

Globe District, Arizona, Sept. 5th, 1878.

The Leviathan Mine.

W. writes us from Gold Hill the following interesting account of this mine. Particular attention is called to the new inventions mentioned in the latter part of the article.

By invitation from the management, we, in company with several gentlemen, paid a visit to the above-mentioned mine, and by the courtesy of the gentlemanly superintendent and his assistants, were enabled to make a thorough examination of its underground workings.

This mine is situated in Gold Hill mining district, Storey county, Nevada, and was located in 1862 by A. Fleming and others, upon a fine body of croppings east of the Crown Point and Belcher, and distant therefrom about 1,000 feet. The mine contains 2,000 lineal feet and 300 feet in width. The working shaft is located on the west side of Main street in Gold Hill, and near the center of the claim. The mine is incorporated in San Francisco, N. Atkinson, President; F. E. Luty, Secretary; John McMahon, Superintendent. Office, 507 Montgomery street. The opening and developing the mine was commenced by the present management about three years ago. The main hoisting shaft has attained a depth of 600 feet, and from that point an incline was started east to intersect the ledge, which had been cut through by the shaft at the 400-foot level. The ledge has been reached at a distance 400 feet east of the shaft, and at a greater depth of about 150 feet. Drifts are now being run north and south from the bottom of the incline, following the west wall of the ledge. In the north drift the rock is easily scaled off the black dyke, or the west wall of the ledge, leaving it exposed the whole hight of the drift. Stringers of quartz are coming in from the east, which show splendidly and assay well. The Superintendent and the experts who have examined the mine, feel confident of encountering a fine body of ore a few feet further north. About one and one-half years ago, in a drift on the 600-foot level, about 60 feet north of the face of the present drift, was found a very promising body of ore. It is for this body of ore the north drift is being run, and from present indications the ore body will be reached much short of where found on the 600-foot level. The south drift is in the footwall of the ledge, and on the west side shows a large body of vein matter. Crosscutting will soon be commenced on both the north and south drifts, when it is confidently believed that the Leviathan will make a showing that will gladden the hearts of her owners.

The management of this mine has been upon a very economical basis. The machinery is good and of sufficient capacity to sink 400 or 500 feet deeper. The assessments have been light, and it is hoped and believed by the management that in the future they will be still lighter.

Before closing this article, I will mention a device invented by the Superintendent, John McMahon, for hoisting the car up the incline to the bottom of the vertical shaft by the power at the surface. It consists of two pulleys at the bottom of the shaft, one stationary, and the other so constructed upon arms and hinges as to hang in a niche in the side of the shaft and out of the way of the cage. The rope attached to the car in the incline passes over the stationary pulley and under the swinging pulley, which, when brought into use, swings into the center of the shaft, keeping the rope vertical in the shaft until the car is landed at the station, where it is run on the cage and hoisted to the surface. The whole business is managed by one man at the station, who attaches and detaches the rope and runs the car on the cage.

By this little device the company is saved about $1,000 per month. It does away with the necessity of an air compressor, three additional engineers, three or four additional laborers, saves 60% in fuel, besides the original cost of the machinery necessary to do the same work in the old-fashioned way. It is estimated that the saving for the first year will be about $20,000 to the stockholders, no inconsiderable item in itself. The same gentleman has invented a safety cage, which is now in use in this mine, and is also worthy the notice of mining men.

SOLAR STEAM POWER.—W. Adams of Bombay, India, has been mentioned as boiling water by the heat of the sun. He has lately tried further experiments, as follows: In the presence of several gentlemen of Bombay, nine gallons of water were poured into a small boiler at 9:25 A. M. The rays of the sun were then directed on the boiler, and the water boiled in exactly thirty minutes. After boiling one hour, the focus was turned off, when it was found that three and three-quarter gallons had been evaporated. In the experiment described above, he used 198 glass mirrors, each fifteen inches by nine and one-half.

DISCOVERY OF A NEW BRITISH MINERAL.—Mr. C. E. Manby, an English analytical chemist, has discovered a new mineral in the mineral clay of Furness. From a paper on the subject read before the Barrow Naturalist Field Club, he says he names the new mineral vermicellite, owing to its similarity in many respects to the vermicellite of Pennsylvania, belonging to the mica group. The distinction between the two metals appears to be a great increase of ferric oxide in vermicellite, a decrease of alumina, silica, and water, with the addition of new compounds, titanic and phosphoric acids, lime and soda.

MECHANICAL PROGRESS.

A Scale of Constant Equilibrium.

We read in an exchange, the *Manufacturer and Builder*, an account of a scale which, for extreme nicety, seems without a parallel. It is so sensitive that it notes and records the growth of a plant and the waste of nerve tissues on the living subject. It has been constructed by A. Redier, of Paris. It is a platform scale in constant equilibrium. On a stand next to the platform are placed the registering cylinder, the clock-work, which rotates slowly, and the double wheel-work, which determine the state of constant equilibrium. The principle by which the equilibrium is restered, as soon as it has been disturbed by some cause or other, is this: If we place on an ordinary balance a glass full of water, counter-balanced by a weight, and if we dip into that glass a mass, whatever it may be, hanging from a thread, the equilibrium will be destroyed; in proportion as the plunger penetrates more or less into the liquid, it will more or less disturb the equilibrium. It is such a plunger which Mr. Herve Mangon has made use of to establish the state of constant equilibrium on the platform scale in question.

Under the little platform of the instrument is a cylindrical vass, three-fourths filled with water; a cylindrical plunger, of which the supporting thread is rolled over a pulley, is lowered or hoisted by the wheels of the pulley as soon as the large platform experiences any augmentation or diminution of weight. The equilibrium restores itself immediately, and the motions of the pulley are transmitted to the lead pencil which passes over the surface of the registering cylinder, leaving on the unrolled paper traces of all its movements. The wheels of the pulley are the same as those used in the registering barometer of Redier; the one goes constantly to the right with an escape; the other to the left, with twice the speed of the first, and the extremity of the balance, by its motions, determines the freedom of the fan of the second wheel-work, which makes the pulley turn in the desired direction.

Several specimens of this balance have been successfully used for several months by Grandeau in his laboratory of the Western Agronomical Station. M. Grandeau has, with the help of this balance, undertaken a series of experiments on the evaporation of the soil and of plants.

In one of his late lectures at the Conservatoire of Arts and Trades, M. Maugon made the registering balance operate in a striking manner. A man sat on the platform scale; the curve traced by the apparatus indicated a certain diminution of weight, to which all living beings are subject during repose. When the curve was neatly traced, the man began to read aloud. The mechanical part of the apparatus, as small as it is, at once indicated its sensibility; as soon as the reading began the curve changed its form, and indicated a greater loss of weight.

The Steam Wagon.—We learn from the Colusa *Sun* that the steam wagon, belonging to the San Joaquin Company, made a round trip from Princeton to Willows. The writer was at Princeton, last Tuesday, when it came in with a load of wheat. It was loaded with 20 tons of wheat by J. S. Wall, but the rods connecting the wagons broke just before it got to Princeton, and they had to come in with only two wagons. It was a day and a half getting in from Willows, but there was no heater on the boiler, and and there were several other deficiencies noticed, but Capt. Roberts, who was with the wagon all the while, is entirely satisfied that it is a success, and he says the Company will immediately invest $60,000 more in the manufacture of the wagons, and in wagons to carry the freight. They took the wheat from Willows to the ship side at San Francisco at $3 a ton, the same as charged by the railroad to Vallejo.

A Hand Power Rock Drill.—A correspondent, writing from the Paris Exposition, says: I have recently witnessed the operation of a newly invented hand power rock drill. It may be worked by two men with a pressure of 80 pounds per square inch, on the top of the cylinder, and a proportionate dead blow of 20 pounds per square inch, It is admirably adapted for tunnel drilling, where the expense of the steam drill cannot be afforded. It is worked by a crank force being applied to the drills by a system of cams. Yesterday an old Californian expert in rock mining, in two minutes, drilled with this machinery, a hole two and one-half inches in depth in a block of hard granite.

Combustion under Pressure.—Verdie's apparatus for combustion under pressure has been adopted at Tamines, the seat of the Hasard collieries. The cost of the apparatus, with royalty and firing, was £240. At the Marie-mont Colliery Verdie's apparatus has been supplied to four boilers, the cost, exclusive of steam engine, being £480. The saving in fuel at the latter colliery is estimated at 25%, a cheaper fuel being used. A similar saving in fuel is reported to be effected at the Namur Glass Works, where the Verdie apparatus has been adopted.

American Locomotives for Australia.

The influences of the Centennial exposition are still clearly observable in our export of manufactured articles. From their exhibit at Philadelphia, the Baldwin locomotive works of that city gained entry to Australia for their locomotives, and they are now building especially for the Australian demand. On the first of the present month one passenger and two freight locomotives were shipped to New South Wales. The passenger locomotive is of the type used in American railroad practice, but with some features of construction according with the usages prevailing in the colonies. It has cylinders 18 by 24, driving wheels 63 inches in diameter, and a four-wheeled swinging bolster truck with wheels 30 inches in diameter. The total wheel base of the locomotive is 21 feet 6 inches, and of locomotive and tender, 43 feet 6 inches. The tender is on four-wheeled trucks, in accordance with the American practice. The tender wheels are 36 inches in diameter. All the truck wheels for both engines and tender are steel-tired.

The two freight engines are of the consolidation type, as introduced by the Baldwin works several years ago. They are the largest and most powerful engines which have ever been made in the world. They weigh when in full working order, exclusive of tender, 102,000 pounds each. Their dimensions are as follows: Cylinders, 20 by 24; eight driving wheels in front, 30 inches in diameter; one pair of pony truck wheels in front, 30 inches in diameter, with swinging bolster and radius bar; total wheel base of engines, 22 feet 10 inches, and of engine and tender, 45 feet 11 inches.

The strength of these locomotives can be imagined from the fact that at recent experiments one of them drew 160 empty cars, making a train one mile in length. They are guaranteed to draw from 90 to 100 loaded cars each trip. The English have hitherto had the exclusive control of the locomotive market of the colonies, and the fact that the Government has been induced by superior merit to transfer its custom to an American house has occasioned no little alarm among them, especially as they admit that they are unable to compete with such workmanship.

Sun-Heat Cooking.—Mouchot exhibits at Paris an apparatus for utilizing the sun's heat. It consists of a truncated cone mounted on stand similar to the tripod of a level, so constructed that the axis of the cone can be adjusted to suit the position of the sun. The inner surface of the cone is polished, reflecting the rays of the sun toward the axis of the cone where a glass cylinder is placed, serving as a receptacle for the water to be distilled or the food to be cooked. With a cone 16 inches in diameter and 10 inches high, Mouchot has succeeded in cooking beef in 3 hours 30 minutes in France, while it took only 3 hours in Algiers. Poultry was cooked in 25 minutes in France and in 20 minutes in Algiers. A large apparatus having a cone several meters in diameter is to be erected in Paris between the Trocadero and the Seine.

Travel by Bicycle.—Mr. R. Naunton, of Mayfield, sends us an English paper which reports that Mr. John Rankin, a young Kilmarnock gentleman, has just completed a journey to London and back on a bicycle. He left Kilmarnock on the 23d of July and reached the metropolis on the 1st of August, after having made a stay of two days at Sheffield, part of a day at Birmingham, and part of a day at Coventry. The distance of 439 miles was thus run in about six days, making allowance for stoppages. Mr. Rankin left London for home on the 5th of August, taking the east coast route, and reached Glasgow on Saturday evening, thence going to Kilmarnock that night by train. The longest run in one day was from Morpeth to Edinburgh, the distance traveled being 112 miles.

Preserving Iron from Rust.—Some months ago we described Prof. Barff's method for obtaining this desirable result. We read that the process is well illustrated at Paris by the numerous articles there shown. At least a couple of hundred specimens are now on view, of which we will name the following: A small riveted girder, various boiler plates (some of them riveted), divers rainwater pipes, gutters and traps, ventilators, urinals and washbasins, gas and water pipes, various railings, statues for fountains, and a number of domestic utensils, such as saucepans, fire irons, etc., as well as some fine specimens of Berlin ironwork, among which a man in armor is specially to be noted.

Prize for an Invention.—Charles Bartlett, United States Consul at Guadaloupe, informs the Department of State that the authorities of that colony have offered a premium of 100,000 francs to the inventor of a process to obtain a yield of over 14% from sugar cane. The competition is open until June 30th, 1880. It is not for an improvement on sugar mills, but for the discovery of a process bearing upon the yield of turbinated sugar. All the expenses of transit, putting up of machinery or implements are to be borne by the inventor.

A Spanish Gun.—A Spaniard of Madrid has invented a novelty in revolving fire-arms. It consists in the addition of a special chamber for receiving from the rear end of the cylinder a portion of the gas resulting from the explosion of the cartridge, and conveying it to one of the discharged chambers to expel the empty shell.

SCIENTIFIC PROGRESS.

The Air as a Geologic Agent.

At the recent meeting of the British Association for the Advancement of Science, an American, Prof. T. Sterry Hunt, of Boston, read a paper on the relation of the atmosphere to geology. He began by noticing the inquiries of Ebelmen into the decomposition of rocks through the influence of the atmosphere, resulting in the fixation of carbonic acid and oxygen, and discussed at length, with arithmetical data, the question. He inquired farther into the fixing of carbon from the air by vegetation, with liberation at the same time of oxygen, both from carbonic acid and from the decomposed water, the hydrogen of which, with carbonic, forms the bituminous coals and petroleums. It was shown that the carbonic acid absorbed in the process of rock decay during the long geologic ages, and now represented in the form of carbonates in the earth's crust, must have equaled probably 200 times the entire volume of the present atmosphere of our earth. This amount could not, of course, exist at any one time in the air; nor would it at ordinary temperatures be liquefied at the earth's surface. Whence came this vast quantity of carbonic acid which must have been supplied through ages? The hypothesis of Elie de Beaumont who supposed a reservoir of carbonic acid stored up in the liquid interior of the planet, was discussed and dismissed. The gas now evolved from the earth's crust from volcanic and other vents was probably of secondary origin, and due to carbonates previously formed at the surface. The solution offered by the author is based upon the conception that our atmosphere is not terrestrial, but cosmical, being a universal medium diffused throughout all space, but condensed around the various centers of attraction in amounts proportioned to their mass and temperature, the waters of oceans themselves belonging to this universal atmosphere. Such being the case any change in the atmospheric envelope of any globe, whether by ths absorption or the disengagement of any gas or vapor, would, by the laws of diffusion and static equilibrium, be felt everywhere throughout the universe, and the fixation of carbonic acid at the surface of our planet would not only bring in a supply of this gas from the worlds beyond, but by reducing the total amount of it in the universal atmosphere, diminish the barometric pressure at the surface of our own and of all other worlds. This conception of a cosmical atmosphere of which our own forms a part, is not new, but was put forth by Sir William R. Grove in 1843, and is developed in the very learned and ingenious work of Mr. Mattieu Williams on the "Fuel of the Sun." Tyndall, by subsequent researches on radiation, showed that certain gases, in amount too small to affect considerably the barometric pressure, might influence powerfully climatic conditions, and suggested that in the former presence in the atmosphere of moderate quantities of a gas like carbonic acid might be found a solution of the problem of the climates of former geologic ages. According to the author, the amount of this gas, which since the advent of life on our earth has been subtracted from the universal atmosphere, although it may not have sufficed to diminish by more than a small fraction the pressure at the earth's surface, would account for all the conditions of geological history as far as temperature and climate are concerned. He maintains that while we have evidence of a warm or sub-tropical climate prevailing over the Arctic regions from the carboniferous down to the lower cretaceous times, and gradual refrigeration up to the temperate climate of the miocene age, we had, for the first time in the pliocene age, the evidence of Arctic cold, which with some variations has continued until now. Since that date geographical variations have caused and may again cause, local climatic changes of considerable magnitude; but no such changes could permit the existence over continental areas within the Arctic circle of such tropical vegetation as we know to have once flourished there. Geographical changes, as J. F. Campbell, Dawson, and others have so well pointed out, might lift large areas into the region of perpetual frost, and thus give rise to local glacial phenomena, and may, moreover, account for considerable local climatic variation at the sea level since the pliocene age. We cannot, however, account in this way for the warmer climates of previous ages, but must seek for their cause in the former constitution of the atmosphere.

Science and Art Teaching.—In England, the twenty-fifth report of the Science and Art Department of the Committee of Council on Education has been issued. *Iron* says: It shows that the number of persons who have, during the year 1877, attended the schools and classes of science and art in connection with the department are as follows, viz.: 55,927 attending science schools and classes in 1877, as against 57,988 in 1876, and 610,620 receiving instruction in art, showing an increase upon the previous year of 80,208, or more than 15%. At the Royal School of Mines there were 38 regular and 181 occasional students; at the Royal College of Chemistry, 282 students; at the Metallurgical Laboratory, 73. At the Royal College of Science for Ireland there were 21 associate or regular students and 45 occasional students. The lectures delivered in the lecture theater of the South Kensington Museum were attended by 8,481 persons. The evening lectures to workingmen at the Royal School of Mines were attended by 1,227 persons; and 172 science teachers attended the special courses of lectures provided for their instruction in the new Science Schools of South Kensington. The various courses of lectures delivered in connection with the department in Dublin were attended by about 4,300 persons. The total number of persons, therefore, who received direct instruction as students, or by means of lectures, in connection with the Science and Art Department in 1877, is 681,367, showing an increase, as compared with the number in the previous year, of 81,199, or more than 13½%.

The Rocks under London.—Recent well boring in London settles some contested points concerning the rocks under the English metropolis. The boring passed through 652½ feet of chalk, 28 feet of Upper Greensand, and 160 feet of Gault, at the base of which was a seam, three or four feet thick, of phosphatic nodules and quartzite pebbles. Beneath this was a sandy calcareous stratum of a light ash color, passing into a pale or white limestone, and this into a rock of oolitic aspect. Casts and impressions of shells found in this bed showed it to be the Lower Greensand, whose place it occupied. The boring was carried further in the hope of reaching the loose water-bearing sands of this formation; but the rock became very argillaceous, and when 62 feet of it had been passed through, the boring entered into mottled red, purple, and grenish shales, dipping at 35° in an unascertained direction. These beds continued through a depth of 80 feet, when, their nature being clearly ascertained, the boring was stopped. The fossils of these colored beds, which included Spirifera disjuncta, Rhynchonella cuboides, and species of Edmondia, Chonetes, and Orthis, show them to be of Devonian age. Thus, the existence of Palæozoic rocks at an accessible depth under London, and the absence of the Jurassic series, as maintained long since by Mr. Goodwin-Austen, is experimentally demonstrated.

Perils of the Government Scientific Service.—As we sit and study the splendid reports upon scientific subjects as treated by the government in our wild regions, we seldom think of the hardship and peril by which the truths are obtained. A letter from Mr. A. D. Wilson, topographer of the Hayden survey, contains a picture it will do to remember. He writes: On the 25th, the Indians surprised us at Henry's Lake, at half-past eight. We were sitting around the camp fire when we were fired on by the Indians, who were not more than seventy feet distant. Strange to say, they hurt none of us by their fire. We made an ineffectual effort to protect ourselves, and concluded nothing could be done but to get away alive. We heard the Indians driving off our animals, and then knew that our party was in reality afoot. Taking provisions for three or four days, and our blankets and guns, we got away under night, and moving off about a mile in the woods we remained there until daylight, when the Indians reopened fire on our deserted camp, and we started for the Upper Geysers, and after a hard walk of three days we reached there, and found Jackson's and Gannett's parties there and all safe.

A Phonoscope.—At the British Association meeting, Mr. Ladd read a paper on Edmund's "Phonoscope." This was an instrument for producing figures of light from vibrations of sound. It consists essentially of three parts—an induction coil, an interrupter and a rotary vacuum tube. The action of the instrument is as follows: Sounds from any source produce vibrations on the diaphragm of the interrupter, which, being in the primary circuit of the induction coil, produce at each interruption a current in the secondary coil similar to the action of a contact breaker. Therefore each vibration is made visible as a flash in the vacuum tube. The tube revolving all the time at a constant speed, the flashes produce a symmetrical figure like the spokes of a wheel, as in the Gassiot star. The number of spokes or radii are according to the number of interruptions during the revolution of the tube, and the number of vibrations are varied to any extent, according to the sounds produced, and the figures in the revolving tube will be varied accordingly. In case of rhythmical interruptions being given, such as a given sound, or a trill, most beautiful effects were noticeable. The uses of this instrument are the rendering visible of sounds and showing the vibrations required in their production, and is a mode of confirming by sight an appeal to the ear.

Prof. Hanks' Gift to France.—A correspondent at the Paris Exposition writes as follows: The School of Mines in Paris desires the collection of California minerals which Mr. Hanks, the Commissioner, is duplicating from his own collection for the purpose of presenting them to France. The Jardin des Plantes authorities desire the same also, to add to their mineral cabinet. Both parties are pleading for them before your Commissioner. The Commissioner has determined to leave them simply to France, and let the rival schools, cabinets and professors settle the division of the gift among themselves. Prof. Hanks has been awarded a certificate of honor for his work at the Exposition.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

AMADOR.

MINING NOTES.—*Ledger*, Sept. 21: Ore from Down's claim, near Volcano, yielded at a late crushing, average of $80 per ton. This is the best average reported for some time. There is plenty of similar high-grade ore left in the miue. The shaft is down 240 feet, with a ledge three feet in thickness at the bottom. The owner is satisfied tbat there is sufficient quartz exposed to keep Stewart's ten-stamp mill running steadily for the next twelve months. A small crushing lately made at the Talisman mill of ore from the Iowa mine, Tucker Hill, near the Mahoney, Sutter Creek, realized about $4 per ton, barely enough to cover expenses. A new discovery, however, hae been made upon the property within the last few days, which promises better results. A ledge 12 feet wide is exposed, the rock from which wears a remunerative aspect.

ITEMS.—Arrangements are now being made to put up new steam hoisting works, and a ten-stamp mill on the Moore mine forthwith. Another einking will soon be commenced in the middle shaft of the Oneida mine. Timbers, and all other necessaries have been engaged for a einking of 150 feet. The mine is being run on a very safe and careful plan, by the present Superintendent. W. Doyle is prospecting on his claim in Hunt's gulch. He thinks he is nearing the mother lode.

CALAVERAS.

CHAVANNE MINE.—*Citizen*, Sept, 21: Mr. Chavanne, owner of the McNair mine, who has spent a large eum of money in opening up the mine, has at last struck rich rock. The lead varies from one to two feet in width and shows plenty of free gold. This mine is on the extension of the Ferguson & Wallace claim, and will undoubtedly prove as remunerative to its owner, as that claim has. Mr. Chavanne has erected a first-class mill, costing in the neighborhood of $20,000, beeides making numeroue other improvements.

RICH STRIKE.—Collier has struch a rich quartz claim, about 5 miles above Murphy in the direction of the Echo mining district. He had 16 tons of ore crushed, which paid $5,100. The ledge ie near the surface. the deepest part eunk being 40 feet. Mr. Collier has commenced the erection of a mill on the mine.

CLEAN-UPS.—*Chronicle*, Sept. 21: Fifty tons of Champion, West Point ore, yielded fully up to the average, which never falls under $100 per ton. Ninety tons of Montana, Mosquito gulch, rock, unassorted, gave an average of about $35.

STRIKES.—In the Rising Star claim, Central hill, a large gravel body was struck within the last fortnight. Three pans gave $32. At a depth of about 185 feet in the Banner shaft, a ledge showing a width of from 18 inches to two feet, all first-class milling rock.

ITEMS.—The San Bruno hoisting works will be moved to the Montana, to aid further sinking in the latter. There is not even water enough to supply the Gwin mine. It is said that J. Zumwalt, Spring gulch, has lately sold his qaartz mine in Jesus Maria district to a San Francisco company. The San Joaquin miue at Mosquito continues to send out high grade ore. Mr. J. J. Holmes, the proprietor, is urging operatione with his usual vigor.

EL DORADO.

KELSEY MINES.—*Mountain Democrat*, Sept. 21: The gold deposit has assumed a bright aspect. Every available man bas been put at work and it has the appearance of a lively camp. The boiler and machinery aro on the ground. Much of the lumber for the building has arrived and teams are hauliug the remainder, so that in a few days a good eubstantial structure will mark the site of the mine. In the Ida Livingstone miue some very high-grade ore was hoisted last week. The rock in this mine is quite hard and progress necessarily elow, but there is a perceptible increase both in quantity and quality of the ore. The Base Metal mine, situated about one mile west of the gold deposit, has given some fine results. Twelve huudred pounds of the ore was worked by furnace and arastra, which turned out a button weighing $300. The ore in this mine is somewhat base, but can readily be worked by a simple process of desulphurizing, aud as it is of high grade, it would justify quite an outlay of time and money in procuring suitable machinery for reduciug it.

INYO.

KEARSARGE.—*Independent*, Sept. 21: Very favorable reports are at hand concerniug this miue, showing that one of the main ledges has been etruck, and the other, the main objective point of the long tunnel, is but eight or ten feet distaut. After four years of costly work the great questiou is soon to be solved, with prospects so far the most flattering.

LOS ANGELES.

SILVERADO.—San Bernardino *Argus*, Sept 15: We have very exciting news from Silverado. The country is alive with prospectors, the estimate being that 1,000 men are scattered throughout the district. Dr. Shelton says that it ie a most favorable country for prospecting, the surface beiug cut into innumerahle deep canyous, whicb reveal on their nearly vertical sides well-defined ledges, many of tbem attaining to the length ou tbe surface of about 600 feet. Men are pouriug into the camp daily. The prospecting columns are moving steadily toward Temescal, in this county, and indeed are now only a mile or two from the dividing line. The Doctor has great hopes in the permanent prosperity of the camp, and argues much good to this town from the new discoveries. A new town is being laid out in Shrewsberry canyon, as an opposition to Silverado. It is to be called Santiago City.

FLORENTINE.—Anaheim *Gazette*, Sept. 21: The owners of the Florentine mine, at Silverado, have had five men at work for some time, and the tunneling done at various places on the claim will aggregate about 150 feet. The tunnel on which work is being done at present is now in 45 feet; it is about 30 feet from the ledge. The ledge once found, they will take out ore sufficiently rich to ship to San Francisco for milling. The company sent a carload of ore to that city some time ago, and the returns, judging from the euergy with which work has since been prosecuted, must have been very satisfactory. The paying vein is from twelve to fourteen inches wide. Assays of rock from this mine run all the way from $100 to $200 to the ton, and unless the knowledge of mining experts is at fault the ledge will be found to extend all through their claim.

CONCENTRATOR WANTED.—There is undoubtedly plenty of ore in Silverado district, that will yield from $40 to $50 per ton, but it don't pay to ship rock to San Francisco unless it yields at least $75 per ton. It bas been suggested that a concentrator, such as is used at the Silver King mine in Arizona, would be a great benefit to the district. The concentrator reduces eight tons of rock to about one ton. This would permit the shipment of low grade ore until a mill is established. The cost of a concentrator is about $1,500. This sum could probably be raised among the miners in Silverado, and a joint etock company formed, if some one would take the lead.

GOLD MINES.—The Opbir mine, at Silverado, and the adjacent Emma, differ from the others in being gold mines. An assay of Ophir ore gave $40 gold, and $6.50 silver per ton. The Ophir ie tunneled about 30 feet. The gold-bearing vein in tbe Emma is from 13 to 15 inches wide.

MONO.

BENTON.—Inyo *Independent*, Sept. 21: The old Comanche has been, for the present, abandoned, and the company are at work on their other mines—the Kerrick and Tower. In the Kerrick a force of some 25 miners is employed extracting the rich, black ore so peculiar to and found only upon Blind Spring hill. The mine is being systematically exploited and shows well, though of itself cannot supply ore sufficient to keep the mill running more than half the time. At the Tower mine, which is located at Yellow Jacket, some eight miles south of the town, work is going on under contract. In the shaft a continuous 30-inch vein of $300 ore has been developed. The ore is entirely different from the Blind Spring rock, and would be readily taken for the richest product of the Comstock, as to appearance and quality. Steam hoisting and pumping works have recently been put in place, eo that deep working is practicable and cheap.

DIANA.—In the Diana work is being prosecuted upon the 600-foot level, drifting and sinking, iu some ore and very good ground, carrying the most favorable indications of the close proximity of a body of ore.

BODIE MINES.—*Standard*, Sept. 18: Tbe Noonday ledge has been traced 650 feet. The sbaft, which is down 75 feet, followed it all the way. A new double-compartment shaft, 4x4 feet bas been started in the center of the ground, about 75 feet east of the ledge, in order that the ledge may be cut at a depth of 100 feet. The Blackbawk shaft is down 398 feet. Rock continues hard; no change in vein since last report. Commenced cutting station this week at 400 level to commence drifting east and west. Winze, on 300 level, down 25 feet, on the west vein. Casings of vein is four feet apart with three feet of ore and one foot of porphyry. Porphyry seems to be cutting out and quartz increasing. The machinery for the new hoisting works for the South Bulwer will soon arrive. The work of cutting out and timbering the new double-compartment shaft has advanced favorably, and at present 20 feet has been timbered. The Riqueza shaft is down 200 feet. Left the ledge at a depth of 33 feet aud intend sinkiug 250 feet before crosscutting. Work progressiug rapidly. Material passed through iron stained porphyry. Arrangements made for an engine and hoisting works. The ledge in the bottom of tbe Summit shaft continues to look well. There is at present two feet of ore on the foot wall, aud eight inches on the hanging wall; assays from which show an average of $51.90. There is yet two feet of "horse," also, betweeu the walls which are nearly five feet apart. The Westchester is near the Red Cloud on the east slope of Silver Hill. A new shaft has been started lower on the hill, than the old prospect shaft, and is now down 54 feet. A crosscut has been started west for the ledge. The Addenda incline shaft is 135 feet deep. Bottom shows three or four feet of ore and ledge matter. Water bas been entiiely bailed out; sinking now with three sbifts, in soft ground. Following down between the walls almost perpendicular. The Ajax shaft is being put down as rapidly as three shifts can work. As soon as lumber is received the shaft will be raised from the eurface eight feet, to give room for the dump and erection of building. The Relief company has been consolidated with the Blue Bell, and is now sinking and timbering. Work progresses rapidly and everything looks well.

NEVADA.

MURCHIE.—Grass Valley *Union*, Sept. 22: The ledge is looking well in the shaft, and is improving in quality and growing larger. The miners are working the Big Blue ledge, and an 18-stamp mill is kept poundiug, night and day, ou the rock. The mine has an air compressor and two power drills running, and hoists about 35 tons of quartz per day. This rock is dumped iuto a hopper about 25 feet from the hoisting works, and from this it is conveyed on the tramway to the mill, which is 1,000 feet from the hopper, the cars making tbe trip in less than two minutes, and dumping themselves at the end of the track. The company have 440 acres of patented land, and timber is plentiful. A flume and water-wheel will soon be constructed, and thus they will do away with steam power. A rock breaker will be put in operation, and, before long, the mill will have all the modern appliances for saving gold. The mill has never had any concentrators until recently, and now there are nine used in saving the sulphurets, which are very rich, some of them going as high as $200 per ton.

GOOD INDICATIONS.—*Herald*, Sept. 17: About two months ago, L. Ragon and John Grimes commenced work on a small quartz ledge located on Grimes' rauch, Gold Flat. When they first commenced work, the ledge was about three inches thick, but iucreased in size with the depth attained. At the depth of 16 feet from the surface it had widened out to the thickness of one foot of solid quartz, and about one foot of ocher on the hanging wall. The ocher prospects well, and the rock will probably pay about an average of $20 per ton. The incline is down 50 feet, and the prospects are as encouraging as ever.

PITTSBURG.—*Transcript*, Sept. 22: Everything is progressing in an unusually eatisfactory manner. About 40 men are employed, and a good number of them are at work on a fine 16-inch ledge in the 800 level. The rock is said to be very fine. New tubes are being put in the boiler, and as soou as they are adjusted, the battery will be started up. There are about 150 tons of fine looking rock already out in one of the dump piles.

ITEMS.—A new stringer in the Hudson mine, it is estimated, will yield from $90 to $100 per ton. Hartley, an old resident of Meadow Lake, has bonded his four mines to George D. Roberts, of Virginia, for $60,000. The mines are the Excelsior, Pittsburg, Bullion and Keystone. The Scadden Flat mine is raising working capital by the sale of 20,000 shares at 75 cents: The hoisting machinery of the Bullion mine has all been taken down and hauled to the Alaska ground, where it is now being erected over the new combination shaft that is being opened for the two companies. The 420 level of the Centennial is probably by this time opened. The rock in the incline has continued of the same rich quality that has been characteristic of the mine in the upper workings. The shaft in the Gold Hill mine is being put down at a rapid rate. The Tam tunnel is in 35 feet on the ledge, which is 14 inches in width. The contractore are pushing work ahead in the Cold Spring mine as rapidly as possible. The Rocky Bar mine is showing improvement of late, both in the drifts and stopes of the second level, and at the bottom of the incline, now being eunk for the third level. The first level, worked on tribute, continuee to yield its usual good quality of paying rock.

PLACER.

QUARTZ MINING.—*Herald*, Sept. 21: Quartz mining in the vicinity of Auharn, and especially in the district lying between Auburn and Ophir, is turning out profitable to those who are engaged in it. The old style of sinking a few feet on a ledge and then abandoning it, because on breaking open a few pieces of rock no gold would be visible to the naked eye, has been done away with in the district referred to, and prospectors are now at work iu earnest, taking out the quartz and sending it to the different mills in the locality and having it crushed. The little 5-stamp mill of Messrs. Simons & Pelster, situated on North ravine, between Auburn and Ophir, has been pounding away for the past month on rock for different parties, taken from different quartz ledges in the near vicinity of the mill, and in each instance the rock has paid well—paying from $12 to $40 per ton.

SAN BERNARDINO.

BORAX.—Inyo *Independent*, Sept. 21: Mr. John Searles and two or three other gentlemen, including his brother, hold Unitcd States patents to a large area of exceedingly rich borax lands or marsh, at Borax lake, just below the southern Inyo line, and, by dint of great perseverance and lahor of their own hands mostly, have suceeeded in establishing very complete borax works. Until quite recently the actual product was one hundred tons of the *refined* article every month. The works, as they stand, have a capacity of fully 200 tons per month, but have not been worked up to the maximum because of tbe low market rates for horax. For months past, owing to an over eupply, the price at San Francisco has stood at about 8 cents per pound, giving no adequate return to the producer. On this account—to give the market a chance to clear itself—this company, as also that at Teel's marsh in Nevada, mutually resolved to suspend shipments in toto, and not wear out their lands for nothing, so nothing more is being done at either place thau to employ a small force in keeping things in order. In general the Searles company work 50 persons; at this time only about 15. Fresh water for domestic uses is piped from a spring some five miles distant. For manufacturing purposes an abundant supply is obtained by means of artesian wells, of which there are eleven, all spouting. These are nothing more than ordinary iron pipes driven 55 feet through the clay and sands of the old lake bed, then pumped out.

TUOLUMNE.

BOSTON TUNNEL.—*Independent*, Sept. 21: Thos. Morris, of the Boston tunnel, has sold his two-thirds interest to Mcssrs. Beaven & Burns, of San Francisco. This claim adjoins the famous New York gravel mine, which paid $1,000 per foot across the channel, near this location. There is a break in the mountain on the Boston ground, with 10 to 40 feet of gravel on the outside. Water can be obtained at a hight of 300 feet, and it is the intention of the purchasers to hydraulic this portion of the ground. They also intend to drift, a shaft and hoisting works being ready for this purpose.

ITEMS.—*Union Democrat*, Sept. 21: Gid. Wing is making a lot of 15-inch heavy hydraulic pipe for the Hassel mine, at Philadelphia diggings, above Columbia. John Londen is pushing work in the Chaparral claim. The tunnel is now in 325 feet and close to the vein. It is expected the pay etreak will be reached in a few days.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Sept. 25: A new, most important, and what promises to be a valuahle ore development, has been made in tbie mine during the week. It was made in the main incline at a perpendicular depth of 66 feet below the 2100 level, and consists of an entire change of ground throughout the full size of the shaft from the hard porphyry in which it had been einking to lively, healthy ore-bearing vein formation, consisting of a broken, chopped-up mixture of vein porphyry, clay and quartz, identical in character and make with that found lying next to the ore vein in the new strike in the Sierra Nevada. The quartz is ore-bearing, and afford assays from $5 to $25 per ton. On the 2100 level the formation so far as penetrated is of a much softer and more favorable character than on either the 2000 or 1900 levels. The bottom of the winze helow the 2000 level is showiug small veins of quartz which afford excellent assays where there was nothing but hard, barren porphyry on the levels above. The main north lateral drift on the 2000 level is again being steadily advanced, the face in hard blasting porphyry. This is a most important drift, connecting as it will in the course of time with the bottom of the North Consolidated Virginia shaft aud opening up the entire length of the Mexican and Union Consolidated mines to that depth. The south drift on the 2000 level is also being driven forward to connect with the joint California winze on the south line.

CON. VIRGINIA.—Daily yield, 175 tons of ore. Although much the largest portion of the Consolidated shaft ie completed, it is not at all likely that the extraction of ore will be resumed for some time, as there is much work to be done on all the levels in repairing the many long working drifts before it can be done to advantage.

CALIFORNIA.—Daily yield, 200 tons of ore. The ore etopes going north on the 1650 and 1750 levels still show finely and are yielding good ore. Sinking the C. & C. shaft is also making fair progress, the bottom in hard blasting ground and the flow of water being still very strong. The great heat on the lower levels is gradually subsiding, which enables the workmen to do a much larger amount of work on a shift. Winze No. 6, helow the sill floor of the 1750 level, is down 16 feet, the entire distance in ore affording low assays. The south lateral drift from the bottom of the joint Ophir winze on the 1950 level is etopped for the present on account of trouble with the water and bad air. As soon as this winze is counected with the south drift on the 2000 level of the Ophir, work in the face will be resumed. This it will probahly take two weeks yet to accomplish. A large quantity of winter supplies are being laid in and everything is working finely.

JULIA CON.—The east crosscut No. 1 on the 2000 level is being pushed steadily forward, the face to-day heing in clay. It is now in 183 feet, and it is believed that good quartz will be again encountered after passing through tbe clay. The main south drift on the 2000 level is rapidly approaching the point under where the good ore prospects and quartz were found on the 1800 level. This drift is running parallel with the ore vein in a very eoft, dry and favorable formation.

TROJAN.—The south drift from the west drift at the second station level is still advancing, the face in fair ore. Tbis drift is now in 52 feet, the entire distance being in ore. The uorth drift on the same level is being pushed vigorously ahead, the face in quartz of a fine character, affording low assays. The west crosscut from the main south drift on the fourth station level is in 59 feet, the face in solid blasting quartz, which shows a steady and favorable improvement. A considerable quantity of good ore is being extracted for milling daily.

CALEDONIA.—The north drift on the 1600 level is steadily advancing, the face in soft porphyry carrying quartz streaks of a very favorahle character. The ground in the face of the

main east crosscut on this level is also in softer and more favorable rock. The main south drift on the 1400 level is showing a very lively vein formation. Sinking the joint winze on the Overman line has been resumed and is making good progress, the bottom in vein matter.

BULLION.—The west crosscut on the 2000 level is steadily advancing. The face shows a decided improvement in both the quantity and quality of the quartz encountered. The ground is getting quite soft and requires constant timbering. Sinking the main incline is making good headway, the bottom in quartz that affords excellent prospects. There are many spots of ore in this vein that assay well.

BENTON.—The nortb drift from the Alta on the 1350 level is advancing alongside of the ore vein in good working ground. It is now 20 feet into the Benton ground. The north drift on the 1250 level has penetratcd the Benton ground 188 feet, and is also running parallel with the ore vein, having a considerable portion of the vein ready for crosscutting.

UTAH.—Sinking the main incline is being pushed vigorously, the bottom in good working ground. A goodly supply of timber and wood is being laid in for winter use.

SAVAGE.—The water is down to the 2100 level. Sinking the north winze below the 2000 level is making good progress, the bottom in vein material.

LADY WASHINGTON.—The north drift on 1250 level of the Alta now being run in the Benton ground will serve to open up this entire mine to that depth.

LEVIATHAN.—Yesterday afternoon the north drift on the 750 level cut into about 16 inches of ore, evidently an offshoot from the main vein, along which the drift is skirting. It shows very good snd improving assays, and gives promise of valuable results when it shall be deemed advisable to crosscut east into the main vein. Nothing new to report of the south drift. It is also skirting along the footwall in the black dyke formation underlying the vein.

MEXICAN.—No work has been done in the joint Ophir east crosscut on the 1600 level during the week. Sinking the joint winze below the 1600 level on the line of the Union Con. will be pushed downward to tbe 2000 level with all the speed possible.

BEST & BELCHER.—Sinking the new joiut Gould & Curry ehaft is making excellent progress. The north drift from the Gould & Curry on the 1900 level is steadily advancing, the face in hard blasting rock.

HALE & NORCROSS.—A breakage of a pumprod has been remedied, and the water is down to the 2100 level. The east drift on the 2000 level, running to make a connection with the Combination shaft, is making good progress.

GOULD & CURRY.—Sinking the joint new shaft is making good progress. The east drift, No. 4, on the 1900 level, ie steadily advancing, the face in soft vein matter carrying a considerable quantity of good looking quartz.

UNION CON.—The northeast drift running to connect with the North Con. Virginia shaft, is making good headway, the face in clay and porphyry carrying occasional streaks of good quartz.

SIERRA NEVADA.—Sinking the main incline is being pushed ahead with all the vigor possible, the bottom in the same lively vein formation; the bottom still cutting at intervals the same regular vein and quartz formation as that which it has exposed for the past 200 feet. Sometimes no ore will be cut for several feet, when a hump or inequality will be encountered, upon cutting into which ore of tbe richeet character will he enconntered. On Sunday last an assay of ore thus exposed gave $400 per ton, Yesterday tbe mine was visited hy five different experts, who each took an average assay of the ore thus exposed at the hottom, the lowest of which was $399, and the highest $700 per ton. Passing through this the incline again gave lower assays, the best being $124, and the poorest $24 per ton, hut again this morning passed into richer ore than any that has hefore heen shown.

YELLOW JACKET.—At the new shaft during the past week the material encountered has been a hard, hlack rock, very hard to drill, but has changed again into gray rock, all the hlack rock having disappeared except in the pump shaft. They are still making good headway and will run very near 100 feet for the month's work. Everything ahout the shaft is running nicely.

ORIGINAL GOLD HILL.—Under new control and management work ie soon to be reenmed. The ledge in the Original Gold Hill on the 300 level is from 80 to 100 feet wide, well defined, with a strata of milling ore of considerahle width, which, with improved facilities for extraction, can be made to pay well under the stamps. This ore vein shows continued improvement as depth has heen attained, and it is the intention of the new management to sink the shaft deeper in order to explore and work the vein at a greater depth, meanwhile extracting and milling the ore at the present lowest level in order to ascertain its actual value. They are also ahout negotiating with the Sutro Tunnel company to explore their mine hy means of a west drift from the south branch of the tunnel when it ehall he completed to a point opposite the mine. This drift will intersect the mine at a depth of 1700 feet below the surface.

BELCHER.—Sinking the north drain shaft is making good progress. It is now down 127 feet on the elope below the 2360 level. It is the intention to crowd the shaft downward to the 2560 level, at which point it is the intention to open another prospecting station. Everything in and about the nine working finely.

SUTRO TUNNEL.—The south branch towards the Julia and Ward shafts is making excellent advancement, the face being in good workiug ground. Work in the header of the main tunnel continues suspended.

CROWN POINT.—The two east crosscuts on the 2360 level are steadily advancing toward the ore vein, the face of each in a fine character of vein material. Everything moving along smoothly.

ALPHA.—Crosscutting the 2400 level is being forwarded with all the dispatch possible, the chances for finding paying ore being excellent.

OVERMAN.—Sinking the shaft on the east side of Gold canyon will be commenced in a very few days. The south drift on the 1600 level is making good progress, the face in healthy vein matter. Sinking the joint winze on the Caledonia line has been resumed and is makiug good headway.

New Incorporations.

The following companies have filed certificates of incorporation:

NORTH SCORPION M. Co.—To mine in Storey county, Nevada. Capital, $10,000,000. Directors—S. D. Wood, A. H. Clough, H. K. White, J. A. Jackson and H. L. Nichols.

GOLDEN GATE M. Co.—Directors—S. F. Thompson, J. R. Scupham, A. W. Havens, J. E. McElrath and B. B. Minor. Capital, $500,000.

HUMBOLDT M. Co.—Bodie district. Directors—A. Hemme, R. Pacheca, H. C. Hyde, W. W. Morrow and B. B. Saucbez. Capital, $10,000,000.

BOOKER CON. M. Co.—Bodie district. Directors—W. M. Lent, C. A. Burgess, C. X. Hobhes, Louis Teese, Jr. and A. H. Rutherford. Capital, $10,000,000.

SOUTH POTOSI M. Co.—South Potosi quartz ledge, Storey county, Nevada. Directors—E. C. Boohar, David S. Lusk, Fred Jones, H. Schel and James O. Mars. Capital, $10,000,000.

CRESCENT G. & S. M. Co.—Mono county. Directors—Geo. S. Carrier, Eugene Theriot, D. F. Manning, J. D. Thompson and C. W. Ham. Capital, $10,000,000.

RUSSIAN G. & S. M. Co.—Directore—George S. Carrier, Eugene Theriot, D. F. Manning, J. D. Thompson and C. W. Ham. Capital, $10,000,000.

COLUMBIA CON. M. Co.—Storey county, Nev. Directors—J. V. Simons, O. H. La Grange, J. P. Jackson, J. H. Crossmain and Geo. W. Kidd. Capital, $10,000,000.

NORTH BONANZA M. Co.—Storey county, Nev. Directors, Joseph Clark, R. N. Graves, John Skae, A. K. P. Harmon and Charles H. Fish. Capital, $10,000,000.

FLOWERY M. Co.—Storey county, Nev. Directors—Joseph Clark, R. N. Graves, John Skae, A. K. P. Harmon and Charles H. Fish. Capital, $10,000,000.

BEACONSFIELD M. Co.—Nevada and California. Directors—S. W. Kennedy, A. C. Chick, Thos. Corbett, J. C. Treadwell, Charles J. Maguire. Capital, $10,000,000.

THREE BROTHERS M. Co.—California and Nevada. Directors—S. W. Kennedy, A. C. Chick, Thos. Corbett, J. C. Treadwell, Charles J. Maguire. Capital, $10,000,000.

NORTH CON. CALIFORNIA G. & S. M. Co.—To operate in Nevada, California and Arizona. Dicectors—C. L. Weller, H. H. Howell, C. A. Herbert, Victor Rapayre. Capital, $10,000,000.

NORTH UTAH G. M. Co.—Esmeralda district, Nev. Directors—A. W. Potter, W. W. Jacobs, C. C. Palmer, George Storey and P. Caffrey. Capital, $10,000,000.

CURTIS CON. M. Co.—Storey county, Nev. Directore—Thos. S. Achison, Robert Sherwood, George P. Thurston, Samuel T. Curtis, W. A. M. Van Bokkelen. Capital, $10,000,000.

GERMANIA G. &. S. M. Co.—Storey county, Nev. Directors—J. O. Eldridge, John Rosenfeld, G. Holland, B. L. Schmitt, J. Naphtaly, J. L. King and L. P. F. Waller. Capital, $10,000,000.

SHERWOOD CON. M. Co.—Storey county, Nev. Directors—Robert Sherwood, George P. Thurston, Samuel T. Curtis, W. A. M. Van Bokkelen and John Foley. Capital, $10,000,000.

CHIEF OF THE HILL TUNNEL Co.—To operate in this State. Directors—Clinton Gurnee, George W. Hopkins, Charles Oppenheimer, William Sherman and J. P. Dyer. Capital, $10,000,000.

OWYHEE M. Co.—Owyhee county, Idaho. Directors—C. H. Johnson, J. P. Couch, W. A. Phillips, Martin Jones, A. S. Baker. Capital, $5,000,000.

MARY ANN G. & S. M. Co.—Storey county, Nevada. Directors—Joseph Gruss, H. V. S. McCullough, Frank Fredericks, George W. Hopkins, E. Terra. Capital, $10,000,000.

MOUNTAIN VIEW S. M. Co.—Storey county, Nevada. Directors—E. P. Marsellus, George W. Towle, Jr., Robert Sherwood, Wm. H. Fifield and Seth Marshall, Jr. Capital, $10,000,000.

UNCLE SAM M. Co.—To mine in Eureka District, Nevada. Capital, $5,000,000. Directors—L. G. Rohinson, Clinton Gurnee, J. H. H. Williams, D. F. Verdenal, Thomas Findley, F. V. Cutting and G. W. Hopkins.

NORTH UNION M. Co.—To mine in Virginia District, Nevada. Capital, $100,000. Directors—H. H. Howell, H. R. Howell, P. B. Nagle, J. W. Clough and E. S Burnett.

CHARTER OAK M. Co.—To mine in Bodie District. Capital, $6,000,000. Directors—C. B. Putnam, W. H. Howland, J. S. Morgan, John Daggett and A. P. Cox.

JUPITER M. Co.—To operate in Bodie. Capital, $6,400,000. Directors—A. J. Ralston, W. M. Gwin, Jr., Josiah Belden, H. M. Yerington and N. K. Masten.

News in Brief.

EMPEROR WILHELM is entirely recovered.

THE deaths from yellow fever aggregate over 5,300.

STRAY hostiles are still committing depredations in Idaho.

MT. HECLA is reported to bave been in eruption August 22d.

SEVEN million people are said to have died in the China famine.

NEW placer diggings have been discovered near Ashland, Oregon.

GLANDERS is reported among horses in and about Truckee Meadows.

THE British mission to Cabul has been turned back by the Ameer's officers.

ABUNDANT rainfall in the north of China will probably secure good harvests.

YOUNG men are already claiming railroad lands in the San Joaquin valley.

LARGE deposits of asbestos have been discovered near McMillanville, Arizona.

THERE are 79 insurance companies doing business on the Pacific coast.

SEPT. 19th, $250,000 in gold bullion was sent from Deadwood, Black Hills.

FRANCE has sent $6,000 as a first instalment of her yellow fever contributions.

MEXICAN commerce with the United States is reported to be steadily increasing.

CHICAGO has sent a grain cargo direct for Glasgow, Scotland, by way of the Lakes.

THE British Parliament has been further prorogued till tbe 30th of November.

THE first successful attempt to ascend Mt. Blanc on the Italian side, is chronicled.

IT is reported that the Frisco mine, Bingham, Utah, has been sold to Chicago parties for $100,000.

W. W. GARRISON of Virginia City claims to have discovered a sure preventive of yellow fever.

LATEST census sbows the population of Japan to be 34,338,404, a steady and large increase since 1875.

IT is rumored that China will confer with Russia on the snbject of the latter's territorial encroacbments.

THE wool clip of Oregon this year is about 6,500,000 ponnds, being ahout 1,500,000 more than last year.

APPLICATION has been made for a patent on a cbalk mark drawn around ehelves to keep ants off. Thus far not granted.

H. R. SYMONDS is bringing diamonds from tbe neighborbood of Jet district, Nev., to San Francisco for examination.

THE bran and corn crops of Santa Barbara county are unprecedentedly large, yielding from one to two tons per acre.

A RIOT against the Japanese government took place on August 23d. Corrupt administration is said to have led to it.

ON September 12th the works of Yuba Q. M. Co. at Hansonville, Yuba county, were destoyed by fire. Loss, $10,000.

A DECREE has been issued by the Viceroy at Nanking ordering the confiscation of every house rented for opium smoking.

THE last round trip of the *City of Peking*, from San Francisco to Hongkong and return, was the quickest on record, 61 days.

AN oil well in Sespe district, Ventnra county, etruck fine green oil at a depth of 1,325 and an increased supply at 1342 feet.

INDIANS have brought some crystallized quartz to Seattle, containing silver, copper and iron, found in the Cascade mountains.

WELLS, Fargo & Co. shipped during the year ending July 1st $2,060,511 of gold hullion and $1,119,635 of silver from Montana.

BURNING GREEN PEAT UNDER BOILERS.—The Montagne Paper Company, Turner's Falls, has heen hurning green peat successfully, under its hoilere set with the Jarvis patent furnaces, but as soon as the owners of peat bogs in the vicinity found it could be burned successfully without drying, they raised the price so high that the mill has gone hack to screenings again. Peat land in the New England States is not worth, on the average, over $5 per acre. It costs about 50 cents per cord to dig and haul peat when within a mile of the mill. Three cords of green peat, burned by the Jarvis process, are equal to one ton of the best soft coal, and the economy over authracite coal is from 30% to 40%. Every mill having peat lands near at hand can supply its own fuel at small expense, as the peat is not dried but used as dug, with a little soft coal mixed.

COMFORT IN SLEEP.—One of the newest patented exhibits which attracted much attention from all, except hashful, newly married people, at the Sacramento State fair, was T. Woodward's clothes clamps for bedsteads. The device is so simple that the most stupid of all servants can operate it instantly and make all the clothing fast in proper position at the foot of the hed. The device is applicahle to old as well as new bedsteads. The inventor's address is No. 56 Eleventh street, Sacramento.

Notes at the State Fair.

Many persons were interested in examining the Excelsior entrance gate, which can be opened and shut without alighting from any vehicle or load of hay. It is so arranged that there is no strain on gate or post and can be adapted to any gate without expense. It is simple, cheap and durable. It is also portable and not set into the ground. No castings are required. The gate was awarded medal at world's fair, 1876; and numerous premiums at the fairs in the country. For particulars apply to H. Brightman, Placerville, El Dorado county, Cal.

Orchardists should not fail to send for descriptions of the "Boss pruner," whicb was shown at the fair by George Larkin, Newcastle, Placer county, Cal. It works on an entirely new principle, and cuts small and large branches perfectly. It bas been thoroughly tested, and we are informed, bas given perfect satisfaction.

An invention of which we propese to speak more fully hereafter, and give an illustratiou, is Thomas' improved apple parer, corer and slicer, which was exbibited by J. R, Craudall, of Auburn, Placer county. This seems to us a very desirable device for doing an important work, and tbose in immediate need of such a machine should address Mr. Crandall at once.

Water Filters.

The subject of filtering water for drinking purposes in cities and towns deserves greater attention than it has beretofore received. Sacramento city is especially interested in the question, and bere is what tbe *State Fair Gazette* says of a popular invention, under the head of "Important to Sacramentans:"

The inv ention which we are about to speak, is the discovery of Mr. Jordan Peters, of Petaluma, and Thomas C. Walters, of San Francisco. It is an improvement in filters and water coolers, and is so simple and practical that it should engrose the attention of every one. It is attacbed directly to the water pipes in tbe house, and filters and cools the water as it comes from the pipes, furnishes the water cool, clear and thoroughly purified. It occupies a very small space, and is no trouble whatever to take care of, as the simple turning of a faucet will clean the apparatus at once. It will never clog up, performs its work perfectly and is more convenient than any cooler and filter we have ever seen before. It is attached to the hydrant in the pavilion, and is there performing its work. Hotels and saloons could not be induced to remain without one, if they knew and understood its working. Particulars concerning the above can be had hy addressing Thos. C. Walters, 612 Greenwich street, San Francisco, or Jordan Peters, Petaluma, Cal.

A NEW MINERAL WHITE.—At tbe recent meeting of the British Academy a paper was read hy Dr. Phipson on a new mineral white. The author, after referring at length to a number of experiments carried on for some years past in bis laboratory with silicates of zinc, magnesia, lime, and other white compounds, with the view of giving to these snbstances the qualities of white lead hy snbmitting them to a great variety of mechanical treatment calculated to indnce molecular contraction, alludes to the ingenious researches of Mr. T. Griffiths, of Liverpool, with sulphide of zinc, which appears to he the only substance hitherto discovered that can possibly supersede carbonate of lead as a white pigment. The preparation and properties of this new white pigment are described in detail, and its composition discussed. After some ten years of laborious and costly experiments, Mr. Griffiths has succeeded in producing a new mineral white by the aid of sulphide of zinc, which entirely eclipses white lead and the old zinc white (oxide of zinc), hy having much more "body" or covering power, and more permanent qualities than either of these, and moreover, not heing of a poisonous nature like white lead, does not affect the health of the workmen who manufacture it or of those who use it. The white sulphide of zinc is precipitated, washed, collected, calcined, levigated and dried, the product being, in the author's opinion, the most perfect white pigment hitherto obtained. The problem which the author had in view—that of producing a mineral white which should supersede white lead, hy being non-poisonous, less costly, more durable, and of better color—has been completely solved in these experiments, for nothing can possibly surpass in these respects the new white obtained by Mr. Griffiths, unless it be some one of the silicates or earths above referred to, which the author'e lengthened experiments prove to he impossible.

TUOLUMNE COUNTY FRUIT.—Mr. H. Quin, of Columbia, Tuolumne county, entered at the State fair a remarkably fine lot of peaches, grapes and other kinds of fruit, which, for freshness and fairness in looks, was not excelled. Although entered too late for competition the committee, we are told, recommended a special premium.

The Engineer.

New Railway Projects at Home and Abroad.

The *Railway World* thinks that very little improvement in the financial affairs of tbe world, or rather in the willingness of capitalists to advance money for railway construction, is needed to establish another era of great activity in railway building. The proposed fields of exertion have to some extent changed, and a good many of the enterprises seriously contemplated at this time have not yet quite reached the stage in which large expenditures are made; but nevertheless the work of conceiving projects, and advancing them so far that final success is only a question of time, still goes on.

Temporarily the most rapid progress will, from present appearances, be in the New Dominion, India, and other British colonies, France, Italy, Switzerland, South American countries, Russia, and portions of Asia, hut indications of a desire to resume construction, on a somewhat extensive scale, or are no means wanting in some sections of our vast republic, and these aspirations are not all unaccompanied with the ability to provide the necessary financial backing.

The Canadian government seems to be thoroughly in earnest in its indorsement of the project for completing an all-rail connection between the British North American possessions on the Atlantic and Pacific coasts, and, as work is progressing at several important points, the final success of this gigantic undertaking can scarcely be considered doubtful. Meanwhile great activity is being displayed in connection with schemes that to some extent hinge upon this movement of our northern neighbors, and it would not be surprising if construction in the regions south of Manitoba, and identified with the Red River valley and various portions of Dakota and Minnesota, should soon be commenced on an extensive scale.

In the central Rocky mountain districts, the Atchison, Topeka and Santa Fe is busy with extensions, which are alleged to have as their objective point, a connection with the lines of the Southern Pacific; the Denver and Rio Grande is pushing its lines south towards New Mexico with considerable vigor, and there have been many evidences or premonitions of activity in various portions of central Colorado, Utah, and districts contiguous to the Black Hills.

Deepening Charleston Harbor.—The construction of the proposed jetties in Charlestou harhor, which the government is about to commence, will, it is confidently believed, make it one of the best on the coast. The plan is like the one employed with such gratifying results at the mouth of the Mississippi. The har at the entrance is about 10 miles long, and the jetties are to be so coustructed as to enclose all the water now spreading over an area of 10 miles in width into a chaunel half a mile wide, excepting what may pass over the suhmerged portion of the jetties. The outflow hetween the jetty-heads, it is expected, will then have eight times the force it has at present, consequently scouring out a channel estimated at from 21 to 24 feet at mean low water. The present depth on the har is only 10 to 12 feet; so that, if successful, the value of the improvements can readily he seen. The *News and Courier* says: It means that the largest vessel afloat can then come across Charleston har, running into a land-locked port spacious enough and deep enough to accommodate the navies of the world.

Shortening the Atlantic Crossing.—The Government of. Newfoundland has addressed a circular to a numher of prominent American contractors inviting their attention to a movement which is on foot looking to the construction of a railroad across the island from St. Johns to St. George's bay, or some other convenient point on the west coast. A preliminary survey has proven the practicability of the scheme, and the Legislative Assembly of Newfoundland has resolved to vote an annual subsidy of $120,000 to any individual or company which will take the matter in hand, besides granting liheral concessions of crown lands for the purpose. The completion of the proposed line would have the effect of opening up enormous deposits of copper, iron, coal, nickel, lead and other minerals, which are now almost inaccessible, while it would also cut through the great pine and spruce forests of the interior, which are also at present utterly useless. The construction of the railroad would shorten the ocean voyage hy 1,000 miles.

Another East River Bridge.—The project of huilding a hridge across the East river near Seventy-ninth street with pier on Blackwell's Island, has heen revived, the ohject heing to connect the railways of Long Island and New York. The plans coutemplate a hridge, which, including the approaches is 9,500 feet long, and 137½ feet high in the centres of the spans over the river. The New York approach begins at Lexington aveuue, and is 3,500 feet long. The span across the New York channel is 718 long, and that over the Loug Island channel 618 feet long. The roadways at the towers is 130 feet above the water. The distance across Blackwell's Island is 680 feet, and the towers on the island will be connected by trestle work. The Long Island eud of the bridge is in the neighborhood of Astoria, and the approach on that side of the river is 3,900 feet long. The New York approach crosses the streets hy trusses 100 feet long, and reaches the surface at Lexington avenue. The road passes under the avenue and connects with the Central railroad at Fourth avenue. The channels of the river are spanned by rigid suspension bridges.

Accurate Tunneling.

An exceedingly difficult piece of underground engineering, and one which furnishes an admirable illustration of the accuracy of calculation hased on scientific priuciples, has just been completed in Pennsylvania at the Hampton mine of the Delaware, Lackawanna & Western Railroad Company. The Scranton *Republican* says: The mine has been idle for improvements for some time, and the work under notice is the construction of a tunnel in the rock vein, making one slope serve the purpose for which two slopes and a "dip" were formerly employed, effecting a eonsiderable saving in men, mules and machinery, and shortening the distance from the scene of the mining operations to the foot of the shaft by at least 2,000 feet. The survey was begun six months ago by Mr. Joseph P. Phillips, Mine Surveyor, under directions of Mr. Snyder, the company's chief Mining Engineer, and from the outset was attended with the greatest difficulty. Over seven-eighths of a mile, principally through old tumble-down workings, had to be surveyed, and 85 sights, at as many different angles, taken before reaching the point opposite the shaft from which operations for the tunnel should he commenced. The most difficult feature was to strike the exact starting point, so that the tunnel, when completed, would be found mathematically correct on grade and point. A variation of a few feet up, down, right or left, would entail additional cost and labor in going over the task to secure uniformity, so that it is not to be wondered at that those responsihle for the work regarded it with some anxiety until the workmen met in the middle of the tunnel, and proved the problem to be correct.

At least a quarter of a mile of the survey was made through old workings where the roof had fallen in, and in some places the space was no more than two feet high, so that Mr. Phillips and bis assistants were compelled to crawl through it. The survey was plotted on a scale of 100 feet to the inch, and the result on Saturday last, when the men who had been tunneling in opposite directions cleared away the last barrier, and met face to face, was of the most satisfactory character. Every line came out just as it had been computed, and the work complimented on all sides.

The Mississippi Jetties.—In a late letter to a member of Congress, Captain Eades makes the following statements concerning the present condition of these great works of improvement: "The jetty channel is now almost as good as the entrance to New York harhor. Larger ships and steamers visit the port of New Orleans than ever before. Ocean freights have been so greatly lowered in consequence that the saving on cotton alone from the port of New Orleans the past season was over $1,600,000. Every intelligent man in Missouri knows that a revolution has been wrought in the grain trade as a result of this deep water. As the channel deepens and commerce adapts itself to these new conditions, the benefits to the producers of Missouri will he still more extensively enjoyed. The permanent improvement of the mouth of the Mississippi operates as a regulator of transportation charges, and thus adds to the value of every bushel of grain grown for export to Europe, or for consumption in the Atlantic States, and it also cheapens to the farmer all of his merchandise and other supplies brought from the East.

Hayden and the Yellowstone.—The *Madisonian* says of Hayden's work in Montana Territory: The interest which is now being manifested in the Yellowstone Park, not only hy people of our own nation, hut also by Europeans, demands a more careful survey of the Park and the country on all sides of it, in order that its facilities of approach may he enlarged. Prof. Hayden is accomplishing this work rapidly as possihle, and will spend the next two years giving Montana a detailed examination, which would seem necessary as his former explorations were more of a reconoissance. A part of the work of the expedition is the preparation of an atlas, showing the geology, topography, and all economic features of Montana. This will be made ready for publication at as early a day as possible, and will he equal to the one just issued on Colorado, which has done so much to spread information concerning that State.

Ship-Canal Project.—The hill authorizing the Barataria Ship-Canal Company to construct a canal from New Orleans to the Gulf of Mexico, and granting the right of way for that purpose, has become a law. The promoters of this enterprise are confident tbat, when this canal is completed, a new and advantageous way of exit to the Gulf for all classes of ships will be opened.

German Projects.—Railway extension is being carried forward by the German government on a comparatively large scale, the State outlay for railways in the year for April 1st, 1877, to March 31st, 1878, having been £5,730,000. The railway companies, which have heen nagged into lower transport rates all round hy senders of heavy goods, are declaring themselves in favor of a return to protective duties.

Academy of Sciences.

Inaugural Address before the Chemical Section.

The following is an abstract of the address of Prof. W. B. Rising at the opening of the Chemical Section of the California Academy of Sciences: I have thought it not foreign to the occasion to say a word in explanation why we have organized into a chemical society, and what we hope to accomplish. I consider it a matter of congratulation to those who are interested in chemical science on this coast, that so many professional chemists are numbered among the instructors at the University. The opportunity is at hand to mutually help each other. So many special branches of the science are represented here that it is possible to discuss the various topics which may come up for our consideration from many different standpoints. An opportunity to present to an intelligent and appreciative audience the results of investigation is a great desideratum. It becomes a great stimulus both to speakers and to listeners, and the discussion which follows may bring suggestions. An organizatiou of some kind had accordingly become a necessity. After long and careful consideration we believed that the time bad fully come. As officers of the University, with its wants and needs ever before us, we wished to organize in such a way as to best subserve its true interests—we would draw especial attention to

The Department of Chemistry.

We would seek to gain for the study of this science the respect of the student on the one hand, and of an enlightened public on the other. I think it not too much to expect that some lover of science—some friend of education and investigation—witnessing the success and harmony of the society and the department, may be induced to give us material assistance. We would have students imbued with a proper sense of the dignity of original investigation, and we shall hope tbat very many may be drawn towards it because of the existence of this society. The managers of the California Academy of Sciences were wise and liberal in allowing its members to organize into sections for special study. We thank them for the catholic spirit which guided them in their organization. We have gladly but modestly embraced the opportunity which they have offered us. We shall attempt to the full extent of our ability to fulfill the ohligation imposed. I am led, in this connection, to say a word in regard to the mutual relations and obligations of the University and the Academy of Sciences. The acknowledged

Aim of the University

Has heen to train up the young men who enter its halls to the completest manhood, to impart instruction, to develop independent thought and action, to so start them in life that they shall add something to human thought. But investigators are the most successful teachers, and investigation becomes the best test of scholarship. The University, then, if it is to fulfill its mission, must do everything it can to encourage investigation. I regard it as an essential part of a higher education—a most practical part, too. I do not hesitate to affirm that nothing in our scheme of eduction can so well fit a persou to meet the difficulties of practical life as the habit of

Independent Thought.

The University, then, should do every thing within its power to encourage the spirit of inquiry and investigation. It should furnish abundant opportunity for carrying forward the same. The Academy, on the other hand, realizing the great ohligation that we are under to men of science in other couutries and in past times, who have freely given the results of their labors to the public, and which we enjoy, would make some return in kind. It aims to do what it can do to promote investigation on this coast. It hopes to aid at least in making discoveries which shall be of benefit to the world. I think it is apparent that the highest and hest interests of

The University and the Academy

Are closely connected; and if they are not identical, they at least lie in the same direction. Each needs the co-operation and help of the other. Each should forget self and self-aggrandizement, and strive to accomplish the noble mission which is set for it. The University had for its special work the education of our youth into investigation; the Academy has for its work the promotion of investigation in general. The University will furnish investigation; the Academy will give them to the world. The University will furnish laboratories, apparatus, museums, books, and so far as it can, teachers; in short, helps of every sort to investigation. Let every citizen of the State, every interest, every organization, do all it can to furnish young men who can grow up into investigators. I think that I can best illustrate what I conceive to be the

Common Objects

Of the Academy of Sciences and the University hy reference to the future Lick Observatory. This institution will he in its objects and tendencies strictly in harmony with the objects of the Academy of Sciences—the promotion of astronomical science. At tbe same time its relations to the University will he close also. The astronomer in charge will need assistants, and these will very naturally be drawn from the students of the University. In turn, instructiou will be given to students at the University by the astronomer or bis assistants, and thus the objects of the Academy will here be united with those of the University—the promotion of science and scientific education going hand in hand. In conclusion, let me again eongratulate the Section on the auspicious circumstances under which it begins its career, and express tbe hope that its labors may bring forth good fruit.

Milling of Auriferous Veinstones.

(Continued.)

The next specimen which Mr. Attwood considered was veinstone from the Melones mine, containing a large proportion of telluric gold, or gold in chemical combination with tellurium, besides gold mechanically mixed with the quartz and pyritic matter. By the ordinary milling process, only the free gold would be taken up hy the mercury. The results by assay of some of the pulverized sample were $2,100 to the ton for gold, but only at the rate of 100 was obtained by the most careful panning.

Fine stamping with water, when the veinstone contains tellurie gold, would result in a serious loss, as tellurie gold is very friable, and a large proportion of it would be held in suspension by the water and be carried away with it, and, in fact, through any appliances that might be devised for its retention; so that the treatment of this character of veinstone is just the opposite of tbose carrying pyritic matter.

Coarse stamping being recommended, and by either of the ordinary milling methods in use to save all the free gold, and then, by concentration, to collect all the beavier hodies, for sale, or to be treated by the chlorination process. No doubt that many of tbe complaints about not being able to save the gold may have arisen from the fact of its being chemically combined with tellurium.

Concerning two specimens of veinstone composed mostly of talc and contaiuing little pyrites, and the gold of which occurred in plates, threads and filures, he said: The stamping of such rock requires great care, as too heavy a flow of water through the mortars would carry the thin plates of gold away. The talcose matter clogs up in the mortars, so that in stamping if any gold quartz can be obtained it is hetter to mix them together.

Mill men appear to be divided in opinion respecting the relative merits of the ordinary milling processes used in this State, viz: the amalgamation in hatteries with copper plates and the hlanket system.

Auriferous Veinstones.

The blanket system may he said to have hcen introduced into the mills at Grass Valley in 1853. The head hlanket troughs were theu made in lengths of about six feet, and the fall from one trough to another was about three inches. The inclination was from three to five degrees with the horizon, hut they were movable and so arranged that hy pressing on a small lever the amalgamator could vary the inclination to suit the flow of water and stamped stuff from the batteries.

The blankets first used were the common hed hlankets, with a long nap. They were expensive, as the nap came off very easily, and there was great waste in cutting them to fit the troughs. Soon after the establishment of, I think, the North Beach Woolen Mills, I sent to San Francisco and ordered the first sluicing blankets. They wove them for me in long lengths and the width of the troughs, were made of a very coarse wool, with the nap thrown up on one side; altogether a much hetter article than is now furnished to the different mills.

The following may be noticed with profit by mill men in a country so careless and extravagant as is California:

In comparing the reports from the different Superintendents of the Australian gold mines and those of this State, the former appear to all agree on the importance and value of having an assay office attached to their works, and in ascertaining the *value* of the material operated upon, and the loss sustained in the various methods of treatment. Monthly statements are furnished of the loss hy each mill, and the actual gold contents of the veinstone treated. In all reports that I have seen hy our California Superintendents, they only give the quantity of rock stamped, sulphurets saved, and the results obtained from the former by milling, and the latter hy sale. They perhaps do not consider it of sufficient importance to puhlish any other particulars, hut if no means are taken to ascertain the gold contents of the rock they are milling, how can they possibly judge of the effect of any modification that may have been introduced in the method of treatment, or that due attention has heen exercised during the various processes to which the vein matter has been subjected? Some general idea of loss on working may be obtained hy sampling the tailings at regular intervals during the day, by placing a bucket under tbe sluice launder, from which they finally make their escape, and when the hucket is full of water and stamped stuff, to set it aside to settle, so that the whole of the solid matter held in suspension is deposited hefore the water is decanted off. The deposit accumulated at the hottom of the hucket should then he emptied into a tuh, and, at stated times, the contents of the tuh should be dried, thoroughly mixed, and then suhmitted to assay.

A tolerable fair estimate may be made of the

gold contents of the rock under treatment, from the average results of samples taken of everything passing direct from the batteries, using a bucket in the same way as for the tailings, but at intervals of every two hours; to which result must also be added the cleaning up from the mortars.

We too often hear of patents being applied for, for some new and mysterious process for the treatment of *rebellious gold ores*, and how crowds of people flock to interview the supposed inventors, without even first taking the trouble to inquire whether there was any such a thing as gold *ores* to treat, or, in other words, any other form of mineralized gold except telluric gold. There are a great many persons credited as miners and millmen, who have acquired any knowledge they possess without much practice, and in an incredible short time; it is this class of men who always recommend and prefer any novel and crude process for the extraction of gold to that in use now, the result, I may say, of our past experience. They do not seem to be aware of how much has been done, written and thought of the matter years ago, and that, in reality, our science may be said to have grown out of our practice.

The stamping-mills of the present day are, undoubtedly, much superior to the old-fashioned square stamps, but the pan, as a *grinder*, will not do as much work, or so cheaply, as a well-constructed edge-mill, and is infinitely inferior to the barrel as an amalgamator.

The blanket system in use now is not so good as that introduced in Grass Valley in 1853.

The Atlantic and Pacific Forests.—No. 4.

[By Prof. Asa Gray.]

It does not altogether follow that, because rain or its equivalent is needed for forest, therefore wherever there is rain enough, forest must needs cover the ground. At least there are some curious exceptions to such a general rule; exceptions both ways. In the Sierra Nevada we are confronted with a stately forest along with a scanty rainfall, with rain only in the three winter months. All summer long, under those lofty trees, if you stir up the soil you may be choked with dust. On the other hand, the prairies of Iowa and Illinois, which form deep bays or great islands in our own forest region, are spread under skies which drop more rain than probably ever falls on the slopes of the Sierra Nevada, and give it at all seasons. Under the lesser and brief rains we have the loftiest trees we know; under the more copious and well-dispersed rain, we have prairies, without forest at all.

There is little more to say about the first part of this paradox; and I have not much to say about the other. The cause or origion of our prairies—of the unwooded districts this side of the Mississippi and Missouri—has been much discussed, and a whole hour would be needed to give a fair account of the different views taken upon this knotty question. The only settled thing about it, is, that the prairies are not directly owing to a deficiency of rain. That, the rain-charts settle, as Professor Whitney well insists.

The prairies which indent or are enclosed in our Atlantic forest region, and the plains beyond this region, are different things. But, as one borders—and in Iowa and Nebraska passes into—the other, it may be supposed that common causes have influenced both together, perhaps more than Professor Whitney allows.

He thinks that the extreme fineness and depth of the usual prairie soil will account for the absence of trees; and Mr. Lesquereux equally explains it by the nature of the soil, in a different way. These, and other excellent observers, scout the idea that immemorial burnings, in autumn and spring, have had any effect. Professor Shaler, from his observations in the border land of Kentucky, thinks that they have; that there are indications there of comparatively recent conversion of oak-openings into prairie, and now, since the burnings are over, of the reconversion of prairie into woodland.

I am disposed, on general considerations, to think that the line of demarcation between our woods and our plains is not where it was drawn by Nature. Here, when no physical barrier is interposed between the ground that receives rain enough for forest, and that which receives too little, there must be a debateable border, where comparatively slight causes will turn the scale either way. Difference in soil and difference in exposure will here tell decisively. And along this border, annual burnings—for the purpose of increasing and improving buffalo feed—practiced for hundreds of years by our nomade predecessors, may have had a very marked effect. I suspect that the irregular border line may have in this way been rendered more irregular, and have been carried farther eastward wherever nature of soil or circumstances of exposure predisposed to it.

It does not follow that trees would re-occupy the land when the operation that destroyed them, or kept them down, ceased. The established turf or other occupation of the soil, and the sweeping winds, might prevent that. The difficulty of reforesting bleak New England coasts, which were originally well wooded, is well known. It is equally, but probably not more difficult to establish forest on an Iowa prairie, with proper selections of trees.

[To be Continued.]

Useful Information.

The Outlook for our Iron Industries.—According to *Seward's Journal*, Mr. James M. Swank, Secretary of the American Iron and Steel Institute, has recently visited the important iron districts of Pennsylvania. He brings most encouraging reports regarding the present condition of the trade, and says the indications for the future are flattering. All the Bessemer and crucible steel mills as far west as the Missouri river with a single exception in St. Louis, are in operation, and of the big iron furnaces about two-fifths are in full blast. There is no accumulation even of the common grades of iron, and all that is produced goes upon the market. The demand is now heavier, he says, than it has been for a long time, and while the production of pig iron is slightly in excess of last year, that of steel of all descriptions is considerably greater. Prices of coal at this time are very firm, with an advancing tendency, and the quotations for Bessemer steel show a fair improvement over those of last year. The country never before consumed as much American-made iron and steel as at present, and the demand for the current quarter being far in excess of its predecessor. Numerous public works now in progress have taken vast amounts of stock, and orders from all quarters of the country indicate a largely increased demand in the immediate future. It is the firm belief of the producers, he asserts, that the opening of the fall trade will reveal a much brighter state of affairs, and that the improvement will be continuous and substantial. This view is firmly fixed in the mind of Secretary Swank, and he declares it to be the prevailing impression in all producing districts.

Harvesting with Electric Light.—We know of cases in which harvesting machinery has been run in the San Joaquin valley with hoodlights, this season. The French have an improvement. A novel use has been made at the trials of agricultural implements at Petit Bourg, France, with the electric light in harvesting. The *Revue Industrielle* says that the conditions for good work were so well fulfilled that the light made it possible to harvest at a distance of more than 1,000 feet from its source. The apparatus was designed by Alharat. The lamp is attached to a high scaffolding on one end of the platform of a portable boiler and engine, the latter serving to run a Gramme electric machine.

On the Subject of Gas Leakage.—Mr. Woodhall, gas engineer to the borough of Leeds, says: "The unaccounted for gas in Leeds is 15½%, over 500 miles of mains, about 80,000 service pipes, and 60,000 meters. The length of mains and other items enumerated are greater in proportion to the sale of gas in Leeds than in any town I am aware of in England. In Manchester and Birmingham, for instance, to about the same length of mains and the same number of meters, there is fully double the consumption."

The Microscope in Photography.—The *Iron Age* states that Lermantoff has recently made some very interesting microscopical experiments in photography. When examining under a microscope magnifying 300 to 500 fold, a dry film of iodine or bromine collodion, transparent crystalline grains of iodine or bromine salts are observed regularly distributed. After dipping the plate into the silver bath the grains grow larger, but the distances between their centers do not appear to increase. Every single grain seems to be converted into the corresponding sivor salt. If developing liquor is poured over the plate, the grains rapidly lose their transparency and grow uninterruptedly, in a manner similar to the phenomenon of crystallization under the microscope. When left in contact for some time with the developing bath to which nitrate of silver has been added, the grains grow until they touch one another. This makes the plates slightly reflective. Davanne has noticed that a line drawn on paper with silver becomes plainly visible by being treated with a developing liquid holding some nitrate of silver. The action of the liquid is not, therefore, dependent upon previous action of light; it may be produced quite independently by contact of the liquid with particles of silver. This fact, and the growing of the grains render it probable that in this case a galvanic reduction of the silver from the nitrate takes place.

FIG. 1. EXTRACTING THE WATER FROM LUNGS AND STOMACH.

A Practical Adoption of the Metric System.—The Boston and Providence R. R. have recently set granite posts along both sides of their road, indicating the distance to its termini. The posts are placed *two kilometers* apart. The distances are marked in kilometers, followed by other figures giving the equivalent miles and decimals, those indicating kilometers being the most conspicuous. The B. and P. R. R. are to be commended for their foresight in this matter. The stones are of a very permanent character, and will remain long after the kilometer has become the customary unit for measuring distance. It is to be hoped that this example will be followed throughout the country.

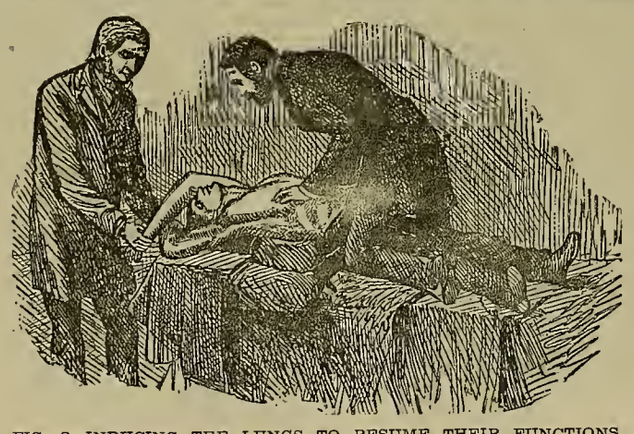


FIG. 2. INDUCING THE LUNGS TO RESUME THEIR FUNCTIONS.

The Population of the World.—The latest edition of Behm and Wagner's *Bevolkerung der Erde* gives the present population of the earth at 1,439,000,000 as compared with 1,424,000,000 as given in the previous issue. These figures are based upon the most recent censuses taken in various countries. The population is divided as follows: Europe, 312,398,480; Asia, 831,000,000; Africa, 205,219,500; Australia and Polynesia, 4,411,300; America, 86,116,000.

A Scientific Voyage to the South Pacific.—A central News telegram says: "The screw sloop *Alert*, one of the Arctic ships, is now fitting out in the Medway for a scientific voyage to the South Pacific. The work is now nearly complete, and the vessel will shortly be able to proceed to sea. Captain Sir G. Nares, K. C. B., who commanded her during the Arctic expedition, will again have the command,

Good Health.

Resuscitating the Apparently Drowned.

We recently gave a description of the method of restoring drowning persons as laid down by Dr. Howard, who, as medical officer of New York harbor, has had much to do in the resuscitation of persons apparently drowned. We repeat the description in order to introduce sketches of the operations and thus make them more clearly intelligible. Dr. Howard's method has received the approval of the New York Academy of Medicine. It has already received the prize of the American Medical Association, and has been adopted by the Life Saving Society of New York. His method is described as follows:

Fig. 1. To Pump and Drain Fluids from Lungs and Stomach.—This is done by placing the patient's face downward over a hard roll of clothing, so that the pit of the stomach is the highest point, while the mouth is the lowest. The operator supplements the pressure of his hands upon the back of the patient, above the roll, if necessary, with all the weight and force at his command.

Fig. 2. For Artificial Breathing.—The patient, whose clothing is ripped open from the waist, is laid upon his back, and the pit of the stomach is made the highest point by a hard roll of clothing beneath the back, while the head is the lowest part. The wrists are crossed behind the head; these a second person, if present, pins to the ground with one hand, while with the other the tongue is held forward with a piece of dry rag. The greatest possible expansion of the chest is thus obtained. The operator kneeling astride the patient, grasps the most compressionable part of the chest, on each side of the pit of the stomach, and using his knees as a pivot, throws forward, slowly and steadily, his whole weight until his mouth nearly touches the face of the patient. Then, by a final push, he throws himself back to his first erect kneeling position. By the sudden removal of the compressing force, the elastic ribs spring back to their original position, and by this bellows action the air rushes into and is forced out of the chest alternately, as in natural breathing. Success may attend this process in a few minutes, but hope of a favorable result ought not to be given up under an hour.

In addition to its apparently superior effectiveness, Dr. Howard claims for this method the conspicuous advantage of unequaled simplicity. When he had the medical surveillance of such matters in New York, he found that one of the most noted facts connected with cases of suffocation and drowning was the probable absence of medical aid at the critical moment. Now, experience has shown that this method can easily be understood by the most illiterate person, and may be carried into execution anywhere, with or without a doctor.

The Use of Milk.

Dr. Crosby, of the Bellevue Hospital, pronounces milk an article of diet which all persons may use, under nearly all conditions. There are those who say that they cannot take milk, that it makes them bilious, etc., but he declares that this is not true. A person who is sick may take milk with the greatest possible advantage, because it contains, in a form easy of assimilation, all the elements essential for maintaining nutrition. It is the natural aliment of the young animal, and certainly answers a good purpose for the old animal, provided it is used properly, and not poured into a stomach already over-filled, as though it had in itself no substance or richness. New milk, he does not hesitate to say, may be taken, as far as disease is concerned, in nearly every condition.

Perhaps it will require the addition of a spoonful or two of lime water. The addition of a little salt will often prevent the after feeling of fullness and "wind on the stomach," which some complain of. If marked acidity of the stomach is present, then perhaps a little gentian may be requisite to stimulate the stomach somewhat, and it may be necessary to give it in small quantities and repeat it often; but ice-cold milk can be put into a very irritable stomach, if given in small quantities and at short intervals, with the happiest effect. It is used in case of fever, which formerly it was thought to "feed," and when scalded it has a desirable effect in summer complaints.

But it is an article of diet for people in health, and who wish to remain in that happy condition, that milk should be most appreciated. For the mid-day lunch of those whose hearty meal comes at night, or for the supper of those who dine at noon, nothing is so good. The great variety and excellent quality of prepared cereals give a wide choice of food to use with milk. Bread, with berries in their season, or baked sweet apples, boiled rice, cracked wheat, oatmeal, hulled corn or hominy, taken with a generous bowl of pure cold milk, makes the best possible light meal in warm weather for children, and for all adults who have not some positive physical idiosyncrasy that prevent them from digesting it. The men of the firmest health and longest life are the men of regular and simple habits, and milk is a standard article in such a diet.

The Week.

The week has been most harren of news. Little has occured to attract attention, unless it be the fluctuations of the stock market, and these are so empty as to merit hare mention here. As winter comes on, the miners are preparing to meet it. Virgiuia miners are laying in necessary supplies. The California hydraulic miners are preparing for the welcome water. Bodie district is growing so fast that she does not seem to have time to stop and think of a wet day, and sends word of new machinery ordered and on the way and of new claims entered and opened. The mines of Silverado are, no douht, worthy of more attention than they are receiving. Prospectors are flocking there in great numbers. Reference to our Mining Summary will show what their hopes and needs are. A correspoudent of the Holt county, Oregon, *Press*, writes to that paper an account of the placer resources of southwestern Oregon. That region has not yet figured among the mining districts of our coast. Yet, judging from the present account, prospectors might well spare some of the desperate energy which they are concentrating on Bodie and the Comstock, and expend it with profit in the lands of our northern neighhor. We notice that mining lands in the neighhorhood of Aurora, Nevada, are coming into notice. This is but the heginning of long activity that may he expected to grow up with the progress of the Bodie railroad.

JOSEPH PFIEFFER, of Rocky Bar, Alturas county, Idaho, has paid $60,000 for 1,000 feet of the Custer lode at Yankee Fork.

The Market is not the Mine.

A few months ago the Bodie stock was flickering hetween one dollar and three dollars per share; suddenly, about the heginning of July, there was a change, Bodie was over four dollars, then over seven dollars; in one week it gained three dollars more and was over ten; the next week it gained seven more; the next, eight, the next, *twenty-one*; until the shares sold for more than fifty dollars apiece. This took place in less than two months. How did the rise start and what did it indicate? The rise in the market started on the report of unmistakahle developments in the mine. A rich pocket was discovered. The discovery was earnest that the commercial world was to he enriched hy some $500,000 worth of gold; that Mono county was to hecome the seat of increased mining activity; that many idle men were to he offered honest employment; in short, that general prosperity was to he not a little added to. These were, and are facts, existing in their own right, entirely independent of any stock market. The rise in the market was, to he sure, in a measure, a gauge of the good prospects; hut in its essence it hears an entirely different interpretation. When Bodie rose in the market, it meant not that somehody thought the stock was a good legitimate investment hecause of the true worth of the mine, and was therefore willing to pay an advanced price for it, hut that somehody foresaw that as the prospects of the mine were hrightening the stock might he soon sold at a still higher price to somebody else possessed of the same acute taste for turning a quick and easy penny. Neither somehody nor somebody else cared a straw whether Bodie was really a good mine or not. All they wanted was a rise in the stock, not an improvement in the condition of the ore-body, and well disguised reports, though empty, would have suited their purpose just as well as facts. To make short work of the matter, the quotations of Bodie stock indicated the temperature to which the blood of some excited gamblers had risen, and not the size, shape, quality and general condition of the Bodie honanza.

What further proof do we want of this than the following: The Bodie mine still exists in its old place; the work upon it is heing rapidly pushed forward; the report comes from the town that "Bodie ore is heing constantly hauled through our streets hy sixteen-mule teams, and Squire Hildreth, at the Standard mill, is kept husy melting and refining Bodie bullion." So much for the mine. How about the market? Bodie stock has come down from its high horse of fifty hands and has heen as low as fourteen. What does that mean? It means that those gamhlers, somebody and somebody else, have discovered a hetter chance to gull each other hy manipulating reports from some other locality, have spied a new "deal" which they think will prove for the moment more profitahle.

But the decline is a gauge of something more. The difference hetween 50 and 14 measures a fall in the hopes of some one, a consumption of so much nerve force, a shortening of life hy so many days, and, it may he added, an increase in revenne to the Government from the manufacturers and importers of alcoholic stimulants.

This is merely an illustration of an oft-repeated story. We are not Bodie hulls. We do not own a share of Bodie stock, and never did. "Bodie" may meau "Sierra Nevada," or "Silver King," or "Martin White." The moral is an old one; yet men forget it, and even legitimate miners sometimes begin to worry when their stock "goes down." The market is not a reliahle gauge of a mine any more than a man's reputation is a true index of his character—no, nor so much. And it is well for the country that the mining industry is a very different thing from the manipulation of markets.

Our College of Mines.

We are glad to note the safe return of Dr. G. F. Becker, Chief of the College of Mines at the University, after a very pleasant and well spent three months in Europe. On inquiry we learn that a month of this time was spent at the exposition in Paris. Dr. Becker also visited the Idria quicksilver mine in Southern Austria, the mines and works of Bohemia, Saxony and South Wales, and the mining schools of Paris, Przihram and Aix la Chapelle. We learn that experiments are heing made hy Dr. Becker, with the co-operation of the managers of the Idria mine, on the protection of iron of mercury condensers against corrosion, and we are promised the results when they are ohtained, for the henefit of our readers. Dr Becker brought with him from Europe several pieces of improved apparatus for the University, which he promises to explain before the Academy of Sciences very shortly. Among this apparatus may he mentioned, as of special interest, Perrot's improved gas-muffle and crucihle furnaces, several petroleum furnaces for the same purposes, and a "Universal Petroleum Grate Furnace," of St. Clair Deville, which may be used for almost any purpose from heating a steam hoiler to melting platinum.

Dr. B. was also fortunate enough to secure for the Agricultural College specimens of the various grains and other seeds which received prizes at the Paris exposition.

WHAT AND HOW?

In this column are printed all sensible inquiries relating to subjects connected with mining or relating to any matters of general scientific interest; also the answers to them as dictated by individual experience, or as furnished by correspondents.

Isinglass.

Four subscrihers write from Scenaga, Ventura county, sending a sample of the mineral popularly called isinglass, hut properly a variety of mica, technically termed muscovite. They have a large mine of the same and wish to know the commercial value of the article.

Muscovite or potash mica is a hydrated silicate of potassium and aluminum. It occurs in vast quantities and widely distrihuted as ingredients of familiar rocks, notahly in granite. But it is only when found in large masses that it is of any practical use. When large pieces can he ohtained, the flexihility, transparency and resistance to heat of the muscovite, adapt it for many, not, however, very important uses. It is used for stove glass, lanterns and lamp shades, for the dials of compasses, etc., for letters on fancy signs, for mounting objects for the microscope, and instead of enamel on photographs. A Philadelphia gentleman has patented a process for silvering mica so as to use it for reflectors, and it has even been proposed to employ it in telescopes. Small and waste stuff is made into coarse powder and sprinkled over tar in roofing to make it fireproof. Finely ground it has been used as a luhricant and for packing deed hoxes and safes to render them fire-proof. Probably the principal use is for stoves and lanterns. In order to find a market for such purposes, the sheets must be of good size, as near colorless as possihle, and free from cracks. The sample sent has damaging stains upon it and is filled with cracks. It is sold at from $1.50 to $5 and $6 per pound, and at times reaches as high as $10 per pound. The larger the pieces, the hetter price they hring. The demand on this coast is not great. Oue large hardware house in San Francisco consumes ahout 10 pounds per annum. The demand in the East is much greater. It has been stated roughly that where 50 pounds is used here, four or five tons would he needed at the East. It is said that they have more mica in the East than can he used, and that a North Carolina company can undersell any one else. This company provide the mica in sheets of standard sizes, which have already such a reputation amoug the trade that it is douhtful whether any attempt to compete would succeed.

In the United States it is found iu New Hampshire, Maine, Massachusetts, Connecticut, New York, Pennsylvauia, New Jersey, Maryland and North Carolina. We believe the market is supplied mostly from the last-named State. It has heen found in marketable pieces near Prescott, Arizona; near Austin, Nevada; and near Soulshyville, Tuolumne county, Cal. It is said that an attempt to hring it to market from Nevada proved a failure. If the mine at Ventura is a good one, very little calculation will serve to show whether or not the muscovite can he hrought to market at a profit.

In the PRESS of Septemher 29th, 1877, an inquiry similar to the one in hand was answered at length. To this number we refer all inquirers. We reprint the following extract from that issue:

At Breslau, Prussia, an important industrial center, one house devotes itself exclusively to manufacturing articles from mica. This house cannot huy the American article, hut now purchases elsewhere, hecause the price here was too high. As for merchantable mica, even of the hest quality, the waste in working it at a factory is from 33% to 75%, and the wastage is not worth a dollar a hundred weight. The price paid hy the house referred to is 14 cents to 75 cents per pound.

In preparing samples, the pieces should he left in their natural shape, not trimmed or squared up, hut just as it comes from the mine. Mica of good quality has the following characteristics: If the top layer, generally stained with foreign suhstances, he removed, the ore heneath, when split off, should he of cystal-like transparency, while the hody of the piece, in all its thickness, should show a reddish hue, with a very smooth surface. To the touch it must feel hard; soft mica, though ever so transparent, does not serve for manufacturing purposes. Finally, the layers, when separated, should he free from flaws or air huhhles. Small pieces, two to five inches square, amount to very little in a commercial view. We have seen perfectly pure, clean sheets, 10 to 16 inches, taken from a mine on this coast, and although it was first-class in every respect, the mica could not he sold here at any price, there heing no demand at all for it on this coast. If the new toughened glass supersedes mica, as it seems likely, for it answers ahout the same purposes, mica would he of no value whatever, except for scientific matters, so that it would not pay to mine it at all.

This presents a very discouraging outlook. Mica has no douht very useful properties. It has heen found very successful in its use for reflectors especially, which is one of its most characteristic applications, as in this its flexibility is availed of to more purpose than perhaps in any other. At the same time it looks as if a mine of it cannot be successfully worked hy parties dependent upon the present market. Enterprising men, determined to increase the numher of applications of the article, would, we think, succeed in making a profitahle market for themselves. But it would require a great deal of patience and much capital.

Electro-Plating.

EDITORS PRESS:—Please give a practical recipe for making silver solution for electro-plating, and ohlige a reader. J. H. O.

Panoche, Fresno Co., Sept. 1st, 1878.

Orr and Ure are our authorities: Take four parts of grain silver; add it, in small portions at a time, to a warm mixture of about five parts, by weight, of strong commercial nitric acid and one part of water. The action should be kept uniform, and if it becomes too hrisk, should be checked hy adding cold water. When the whole of the metal is dissolved, apply a greater heat and evaporate the solution nearly to dryness, which will drive off any excess of acid that may be present. The resultiug salt, nitrate of silver, may he dissolved in a large quantity of water, in the proportion of half a gallon to each ounce of silver used. At the same time a solution should be made of from three to three and a quarter parts of cyanide of potassium in 30 or 40 parts of water, which is to he added gradually to the solution of nitrate of silver as long as it produces a precipitate. The liquid must now he allowed to remain undisturhed until quite clear, the clear poured away from the precipitate of cyanide of silver, and the precipitate washed five or six times in a large quantity of water hy simply adding the water hriskly to it, allowing it to settle and then pouring away the clear portion. Next dissolve from three to three and three-quarter parts of cyanide of potassium in 20 parts of water, adding it in portions at a time to the wet cyauide of silver, with free stirring, until the whole is dissolved, then add about three parts more of cyanide of potassium to form free cyanide and sufficient water to reduce the whole to the proportion of ahout one ounce of silver to the gallon. Finally, when all the free cyanide is dissolved, filter the solution through a piece of unglazed calico. On a small scale distilled water is used, except for washing. On a large scale rain or spring water will do. Sometimes chloride of silver is precipitated hy common salt from the nitric acid solution. The washed chloride is then dissolved in cyanide of potassium. The silver solution may he prepared hy means of a hattery. A hath is prepared by dissolving cyanide of potassium in distilled water. The hattery is charged with this solution and two plates of silver are attached to wires and connected with it. The larger, which is to he dissolved, is attached to the positive, and the smaller, which need he hut the size of a flattened wire, to the negative pole. The action of the hattery is kept up until the desired amount is dissolved.

The Shape of Shoes.

A gentleman writing from Benton, Cal., asks where he can find a shoemaker who will give him a natural fit. As his communication contains more information than questioning, it will he noticed in another column.

Non-Conducting Capacity of Different Substances.

We take the following tahle from the *Polytechnic Review:*

COMPARISON OF THE NON-CONDUCTING CAPACITY OF DIFFERENT MATERIALS, AT EVEN THICKNESS, TAKING BLACK SLATE, THE BEST CONDUCTOR OF HEAT, AT 100:

Black slate	100
Sandstone	71-95
Fire-brick	01.70
Soft chalk	50
Asphaltum	45
Oak wood	33.60
Pine wood	27.01
Wood and plaster	25.55
Sulphate of lime	20.26
Sulphate of lime and sand	18.70
Coarse ashes, shavings, hay, and straw	25-35
Sawdust and tan-bark (fine)	17-20
Mineral wood or asbestos, cemented	18-20
Fine asbestos in thread	13-15
Fine-powdered charcoal	14-16
Ordinary mineral wood, hair-felt, cat-tail, etc	10-13
Extra mineral wood, raw silk, cotton, etc., *quite loose*	8-10
Ice	0

AN ALL-STEEL BRIDGE.—The first all-steel hridge to he made in this country will be erected over the Missouri river, on the line of the Chicago & Alton railroad. It will he of five spans of 350 feet each; the elevation over high water mark will not he less than eighty feet, at which height, the light steel rods of the "Howe truss" will look like cohwehs, hnt for all that the hridge will have a hearing strength reached hy hut few existing structures in the world. The total amount of steel will he ahout 1,500 tons, equivalent to almost double that quantity of iron.

RAILWAY IN ASIA MINOR.—A London dispatch says: It is stated that Commander Cameron will startfor Cyprus soon. Thence he will cross to Asia Minor to survey a route for the construction of a railway to the Persian gulf. His route will lie through Ajas, Marash, Aintah, Diarhekir, Mardin, Mosul, Bagdad and Bassorah. The survey will probahly occupy ten months.

THE Palmetto and Flag mines in the Black Hills were sold for $15,000 each. The Old Ahe with all the machinery brought $160,000.

The Brush Electric Light.—No. 1.

The subject of electric lighting is one which has already attracted much attention, but has not, until lately, proved of any great practical value. The extreme brilliancy and purity of the light, produced between the carbon poles of a powerful electric current, has always excited the admiration of every beholder, but the difficulties in the way of applying the light on a large scale, have, for many years, appeared almost insurmountable.

The chief difficulty was the great cost of chemicals for the production of the current, and the great difficulty of keeping the large number of battery cells in working order. This objection has been entirely removed by the discovery of the fact that a coil of wire, moved in the field of a magnet, is traversed by a current of electricity. In this way it was found possible to generate a current of electricity, in quantity limited only by the power of the magnets, the rapidity of the motion of the wire helices, and the proper mechanical adjustments of the details of the apparatus. In this latter particular there has been much room for ingenuity, and there have been many ingenious dynamo-electric machines invented for the purpose of changing mechanical force into electricity. Of these we shall shortly speak.

The next difficulty was the fact that the carbon poles of the battery were consumed with varying rapidity. This could only be adjusted with the greatest difficulty, except by the use of complicated and delicate mechanisms, which could not be relied upon for rough usage. This latter difficulty was only partially removed by the famous electric candle, but has been overcome very neatly by the apparatus of Prof. Brush, which we shall shortly describe.

The above introduction has been suggested by an inspection of the Brush electric light, which has, for the last few months, been in use in the great court of the Palace Hotel. The light has given universal satisfaction, and its pleasant purity and mildness have made the place a very agreeable resort.

A short description and history of the apparatus which has so well proved itself may not be uninteresting to our readers.

The apparatus for producing the current of electricity is shown in the figure which shows the small machine. It has for its magnetic field, two horse-shoe electro-magnets, with their like poles facing each other at suitable distances apart, the circular armature rotating between them. The currents are generated in coils of copper wire wound upon an iron ring, constituting the armature. This ring is not entirely covered by the coils, but the alternate uncovered spaces between the coils are almost completely filled by iron extensions from the ring, thus exposing large surfaces of the armature ring for the dissipation of heat, due to its constantly changing magnetism. The ring revolves between the poles of two large field magnets, the two positive poles of which are at the same extremity of the diameter of the armature, and the two negative poles at the opposite extremity, each pair constituting practically extended poles of opposite character. The coils on the armature ring are eight in number, opposite ones being connected end to end, and terminals carried to the commutator. In order to place the commutator in a convenient position, the terminal wires are carried through the center of the shaft to a point outside the bearings. The commutators are so arranged that at any instant three pairs of coils are interposed in the circuit of the machine, working, as it were, in multiple arc, the remaining pair being cut out at the neutral point. The commutator consists of segments of brass, secured to a ring of non-conducting material carried on the shaft. These segments are divided into two thicknesses, the inner being permanently secured to the non-conducting material and the outer ones, which take all the wear, are fastened to the inner in such a manner that they can be easily removed when required. The commutator brushes, which are composed of hard brass joined together at their outer ends, are inexpensive and easily renewed. Even at the high rate of speed at which these machines are run, the heating of the armature is very inconsiderable, not exceeding 120° Fah. after four and three-quarter hours run. They are simple of construction, all the working parts being easily accessible, and the cost of maintenance is low.

The above description of the machine, which has been condensed from an interesting article in the May number of the *Journal of the Franklin Institute*, gives as good an idea of the machine as can be given in a few words, and those interested may refer to the above article for further details. The article referred to is the report of a committee to the Board of Managers of the Institute as to the dynamo-electric machine, but adapted to the purposes of the Institute. The committee consisted of Profs. Rogers, Chase, Houston, Thomson, and Messrs. Briggs, Jones, Sartain and Knight. This report, which is very interesting reading, is concluded in the June number. The machines investigated were the Wallace-Farmer, the Brush and the Siemans.

After a very careful and thorough investigation, the committee reported in favor of the Brush machine for the purposes of the Institute, chiefly for two reasons.

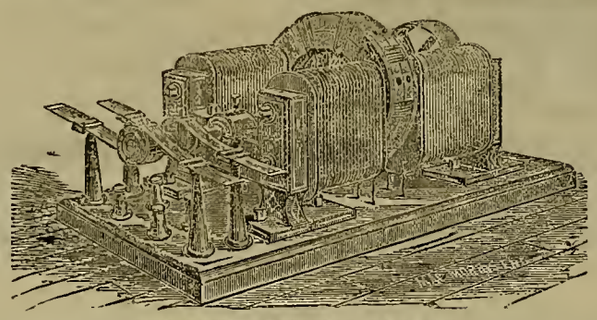
"1. It is admirably adapted to the production of currents of widely varying electro motive force, and produces a good light.

"2. From the mechanical details of its construction, especially at the commutators, it possesses great ease of repair to the parts subject to wear."

The machine selected for the Institute is the small machine figured in the cut. Such a machine should be possessed by our State University. The large machine is the one which is better adapted to electric lighting, for there is a greater economy in its working.

Another great advantage of the Brush machine is the fact that its current is capable of subdivision into several seperate circuits. This is a great advantage over most of the other machines, as formerly it was found possible to run only one circuit with each machine. Mr. Adolph Sutro, of Sutro tunnel, is reported to be much pleased with the results of the Palace Hotel machine. He stated that it was greatly superior for tunnel lighting to anything he had seen in Europe.

This subdivision of the current enables our machine to be used for several purposes at once, as for electro plating, and for the electric light, etc. In view of the recent improvements in the



THE BRUSH ELECTRIC MACHINE.

way of electro-metallurgy, we consider this a great advance in this direction.

The Brush machine is at present manufactured in six sizes, viz.:

No. 1.=	500 candles	1	light or current.
" 2.=	1,000 "	1	" "
" 3.=	2,000 "	2	" "
" 4.=	4,000 "	4	" "
" 5.=	12,000 "	6	" "
" 6.=	25,000 "	12	" "

In the next number we propose to give a description of the improvements of Prof. Brush in the mechanical arrangement of the electro light itself, with some further facts about its efficiency.

BETTER CARE OF LIFE ON RAILROADS.—The *Railway Age* remarks that the vast improvement that has been made in a few years in respect to safety appliances upon railways is indicated every now and then by the comparatively harmless results of collisions and derailments, which formerly would inevitably have been accompanied by terrible loss of life. Now it is not very unfrequent for trains to run into each other at full speed without the death or even serious injury of a single person resulting. Such an accident in Wisconsin a couple of weeks ago, and one near St. Louis recorded in this issue, illustrate the statement. The increased safety of travel is due mainly to the adoption of steam-worked brakes, with which the engineer can instantly arrest the motion, and of continuous platforms which prevent telescoping, the accompaniment of collision which formerly was the most disastrous.

A COMMENDABLE ENTERPRISE IN SAN JOSE.—Bro. Herring, late of the *Agriculturist*, has charge of the Union Free Reading Room, San Jose. He is endeavoring to establish the institution upon an enduring basis for the benefit of all, and is making arrangements to continue to receive his old exchanges and to add many leading periodicals to the list.

THE export of wheat from New York city for the week ending September 14th, was the largest ever known, 2,800,000 bushels.

OREGON is to ship fresh beef to San Francisco.

Mines and Works of Almaden.—No. 2.

[Translated for the Press from "ANNALES DES MINES."]

Silurian System.

The rock which predominates among the silurian rocks in the environs of Almaden is a schist often black, generally gray or brownish, nearly always spotted with hydrated oxide of iron. It sometimes takes a reddish or slightly blue color. It always contains lamina of silvery white mica. It often loses its characteristic structure and becomes earthy. Its layers are never straight nor very continuous; often they are ruptured in every sense, and it is then difficult to determine their direction. It is in the schists that one finds the greater part of the silurian fossils. The most abundant is the *Calymene Tristani*, which hardly ever fails when the schists are fossiliferous. Next comes the *Orthis resdulinaria*, nearly as abundant, but always imprinted, a little Orthoceratite, the *Bellerophon bilobatus, the Calymene Arage, Illoenus, Dalmanites, Asaphus*. One may sometimes traverse great spaces without meeting a single fossil; but in some places the rock contains molds and indeterminable fragments.

After the schists, quartzite is the predominating rock in the silurian layers. It is nearly always white, although frequently spotted with red by oxide of iron, principally along the planes of stratification or the transverse fissures. It is very hard, of a fine grain, and traversed in many places by little veins of quartz. Sometimes it changes into a conglomerate of pebbles united by a silicious cement so compact as to make it impossible to separate any from the mass of the rock.

The quartzite which is found in contact with the black schist takes sometimes the same color, and it is very difficult to explain how in the midst of the same beds white and black quartzite is found. The one or the other is often of great size, forming the elevated serrate crests which surround Almaden.*

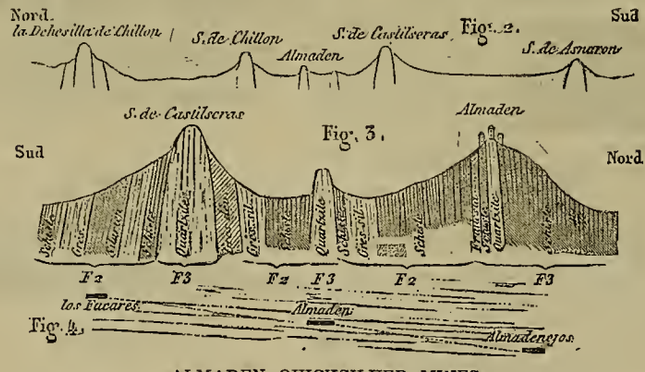
A remarkable fact is that the direction of the chains of quartzite, so distinctly characterized to the north and south of Almaden, is by no means the direction of the beds themselves. The outcroppings of the quartzite run, in effect, north, 80°—90° east, while we have found for the beds of the Sierra de Chillon the directions:

North	70 deg	East
North	80 deg	East
North	115 deg	East
North	110 deg	East
North	113 deg	East

—C. de Prado, upon the geology of Almaden, etc. (Bulletin of the Geological Society, t. XII., 1855.)

This last direction north 110° to 115° east is dominant for two kilometers. At the summit of the chain at the western extremity of which is the chapel of the *Virgen del Castillo* we found the directions north 145°—155°—155°—150°—149° east.

The great banks, nearly vertical and often perfectly level for five or six meters which are found everywhere upon the summits of these chains, permit of exact measurements little subject to errors. Everywhere, or nearly everywhere, the beds make with the axis of the chain an angle varying from 10° to 40° to the south. This fact would seem to indicate at least two successive upheavals anterior to the deposit of the tertiary, which farther on towards Alcaras, at the eastern extremity of the Sierra Morena, reposes horizontally on the straigbtened layers of the silurian rocks. The preceding figures show how the direction of the strata vary at points very near to each other; it is very difficult, under these circumstances, to attribute to this or that particular movement the actual disposition of the beds. All that can be established is that they have been powerfully upheaved and folded at an epoch when they were far from having acquired their present actual consistence.



ALMADEN QUICKSILVER MINES.

In these immense banks of hard quartzite, which give to the country its characteristic relief, there have been found only *Fucoides, Bilobites* and other rare vegetation which M. de Prado formerly collected. This interesting collection is now deposited at Madrid. It is only in the quartzite situated in the middle of the schist that one can see animal fossils; but then one can say that it is another rock, grayish and fragile *(tendre)* often micaceous, colored with hydrated oxide of iron, as one can see at Almaden itself, very near to the entrance of the deepest tunnel (for drainage of the mines), and better yet towards the meridional of the Sierra de Castilseras. These soft quartzites have an external appearance so different from the hard quartzites, that at first sight they might be taken for the devonian sandstone. Fig. 3, where these quartzites have been designated by the name silurian sandstone *(gres sil.)*, shows their interpolation between the layers of schist.

M. de Prado describes these fossils as *Calymene Tristani, Bellerophon bilobatus*, etc.; they are therefore beyond dispute of the silurian epoch, although they should be distinguished from the sandstone with *bilobites*.

Finally, a rock peculiar to the silurian strata of Almaden is that to which the miners have for a long time past given the name *piedra frailesca*, because it has usually the grayish color of the dress of the Franciscan Monks, who had formerly a convent at the market town. It was not known for a long time exactly to what epoch to refer this rock in which M. Dumont and M. de Prado have found *bilobites*. The beds of *frailesca* never seem to extend to great distances; they seem to form a series of intercalated lentils (lens-shaped strata) between the schists. They are breccia very much metamorphosed, essentially consisting of grains of quartz, of carbonate of lime, of dolomite, of fragments of schist, of serpentine; all cemented by an amorphous feldspathic paste.

At Almaden, nearly in contact with the cinnabar-bearing rock, one finds the *frailesca* cemented with dolomitic limestone, with fragments of deep black, thin and not rounded schist, which sometimes have a length of two or three decimeters. The rock, in spite of the predominance of lime, has a schistose structure altogether. Its thickness is more than 30 meters. Its length is not known, but cannot be less than 300 to 400 meters. In the mass are many drusal cavities lined with little rhombobedral crystals of dolomite.*

*We have analyzed this rock at the laboratory of the school of mines and found as a rough estimate of its composition:

Carbonic Acid	4.30
Water	12.27
Silica	44.66
Alumina	17.20
Oxide of Iron (Fe2 03)	7.80
Lime	6.50
Magnesia	3.20
Soda	1.86
Potash	1.15
Total	09 03

The *frailesca* presents otherwise many varied aspects. The collection for use in the preparation of the geological map at Madrid amounts to many samples, of which I will mention the following:

Schistose breccia of *frailesca*	Mines of Almaden.
Frailesca covered with a bed of calc-spar, which is covered in turn by crystallized iron pyrites	Almaden.
Bluish-black *frailesca*	Almadenejos.
Frailesca very quartzose	Almaden.
Frailesca argillacious with nodulis of ocher	Val d'Arrubiel.
Frailesca with limestone veins	Val deazognes.
Frailesca reddish with dolomitic veins	Almaden.

[To be Continued.]

JELLETT'S PACIFIC COAST COLLECTION LAWS.—We acknowledge the receipt from J. H. Jellett of the "Revised Edition" of the above work. Part I. gives a revised list of the names of reliable attorneys in the principal cities and towns throughout the Pacific coast; Part II., the jurisdiction of U. S. Courts. The remaining 10 parts are devoted to a summary of the laws of California, Nevada, Oregon, Washington Territory, Idaho, Montana, Utah, Wyoming, Arizona and British Columbia, including insolvency laws. The revision has been undertaken with a view to concisely present the laws of the Pacific States and Territories as they stand upon the repeal of the National bankruptcy act. The author was assisted by practicing attorneys representing each State and Territory treated of. The lately altered position of bankrupts makes the publication of this work at the present moment especially timely.

ESTIMATED cost of Paris exhibition buildings, 50,000,000 francs; estimated receipts, 21,500,000. It is expected that the government and municipality will indirectly derive a revenue of about 100,000,000 francs.

THE total losses to creditors of all National Banks during the last 16 years upon $500,000,000 of capital, and $800,000,000 of deposits, are estimated not to exceed $6,500,000.

DEWEY & CO.

American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E.COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, hook, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

RUPTURE.

Another Wonderful Cure Effected by CALIFORNIA ELASTIC TRUSS!

CALIFORNIA ELASTIC TRUSS COMPANY, W. J. Horne, Proprietor.—DEAR SIR:— I feel that I owe it to you and to humanity to write the fact that I have been SUBSTANTIALLY CURED of a bad case of Rupture of 30 years' standing, by one of your incomparable Trusses, which I purchased from you three months ago. I cannot describe the suffering, both physically and mentally, that I have undergone during that period; and now I feel like a new being. I have worn all kinds of Trusses, both Steel and Elastic, and never received any permanent relief until I tried yours. Its simplicity of construction, and facility with which it can be adjusted, and the ease and perfect freedom to the motions of the body with which it can be worn without causing any irritation, are its chief merits, and it is a perfect supporter. I have not had any sign of a return of the Rupture since the first day I put it on, and feel that I am PERFECTLY CURED. It is invaluable, and the fact should be known to the world. You can refer anyone to me on the subject of their merits.

I am truly yours, ALFRED J. BURKE,
Chief Mail Clerk S. F. *Daily Evening Post.*
San Francisco, July 20th, 1878.

Endorsed by the Medical Profession.

SAN FRANCISCO, July 9th, 1878.

California Elastic Truss Co.:

After practicing medicine many years in this city, during which time I have had an extensive experience in the application of all kinds of Trusses, I can and do recommend yours as the best in every respect, for it is as near perfection as modern science can make it. It has many advantages over the torturing steel-hoop Trusses, which inflict great injury on the hips and spine, bringing on other distressing ailments, such as lumbago, morbid affections of the kidneys and numbness in the lower limbs, all of which are avoided by wearing the California Elastic Truss. It is not only a perfect retainer, combining ease and comfort, but the pressure can be changed to any degree. It also remains in the proper place at all times, regardless of the motions of the body, and is worn night and day with perfect ease. It is superior to any of the Elastic Trusses now in the market, while it combines the merits of all. 1st—It is easily adjusted on and off with snaps, doing away with straps and buckles. 2d—The universal spring between the plate and pad prevents all irritation, which is a godsend to the sufferer. 3d—The pad is adjusted on and off in an instant, and can be changed for any other size and form most suitable to the case. In fact, it combines every quality essential to comfort and durability, and is unequalled in lightness, elasticity, natural action, and artistic finish. Many of my patients who are afflicted with hernia are wearing them, and all shall in the future, for I think the great ease by which these purely scientific appliances are made efficacious, is truly remarkable. You can refer any parties to me on the subject of their merits. I remain yours truly,

L. DEXTER LYFORD, M. D.,
Physician and Surgeon,
609 Sacramento street, San Francisco.

A Physician's 45 Years' Experience.

COLUMBIA, Tuolumne Co., July 16th, 1878.

W. J. Horne, Esq.—DEAR SIR:—For some time past I have used, in my practice, the California Elastic Truss, with entire satisfaction in most cases of complicated hernia of both sexes. During a practice of 45 years I have found no Truss that would, with the same ease and certainty, retain the required adjustment, the pressure being always under the immediate control of the patient. The simplicity and ease of application is of itself a guarantee to every experienced physician. I have the honor to remit by mail the amount due, knowing that I contribute to the alleviation of afflicted humanity.

Yours truly, J. P. TIBBITS, M. D.

It is constructed on scientific principles and sells on its merits. If you want the best Truss ever manufactured, don't forget the name and number.

Trusses forwarded to all parts of the United States at our expense, on receipt of price.

Send for Illustrated Catalogue and Price List, giving full information and rules for measuring.

Pocket Map of California and Nevada.

Compiled from the latest authentic sources, by Chas. Drayton Gibbs, C. E. This map comprises information obtained from the U. S. Coast and Land, Whitney's State Geological, and Railroad Surveys; and from the results of explorations made by R. S. Williamson, U. S. A., Henry Degroot, C. D. Gibbs and others. The scale is 18 miles to 1 inch. It gives the Judicial and U. S. Land Districts. It distinguishes the Townships and their subdivisions; the County Seats; The Military Posts; the Railroads built and proposed, and the limits of some of them; the occurrence of gold, silver, copper, quicksilver, tin, coal and oil. It has a section showing the hights of the principal mountains. The boundaries are clear and unmistakable, and the print good. 1878. Sold by DEWEY & CO. Price, postpaid, $2; to subscribers of this journal, until further notice, $1.

SACRAMENTO SEMINARY.

SACRAMENTO, CAL.

The Sixteenth annual session of this Institution commences Monday, August 5th, 1878. Young ladies will here find superior facilities for a thorough and finished education, and a home of culture and refinement. The music will be under the direction of Prof. John P. Morgan, founder of the Musical Conservatory of Oakland. For further particulars address,

MRS. HERMON PERRY, Principal.

HEMORRHOIDS OR PILES,

A treatise on their scientific treatment and radical cure, by E. J. FRAZER, M. D., San Francisco. Price, 25 cents; for sale at the bookstores and by the author at 221 Powell street. Sent by mail to any address on receipt of the price in coin, currency or postage stamps.

Machinery.

The Ingersoll Rock Drill.

The lightest, most easily adjusted, and only Drill using rubber buffers to protect cylinder-heads, and with Automatic Feed.

Some of the mines using this Drill on the Comstock Lode, Virginia City, Nevada:

Best & Belcher M. Co.,	Con Virginia M. Co.,
Crown Point M. Co.,	California M. Co.,
Belcher M. Co.,	C. & C. Shaft,
Yellow Jacket M. Co.,	Utah M. Co.,
Sierra Nevada M. Co.,	Ophir M. Co.,
Silver Hill M Co.,	Mexican M. Co.,
Sutro Tunnel Co.	Overman M. Co.,
Gould & Curry M Co.,	

REYNOLDS, RIX & CO., Agents.
18 & 20 Fremont Street, San Francisco, Cal.

KING ENGINE.

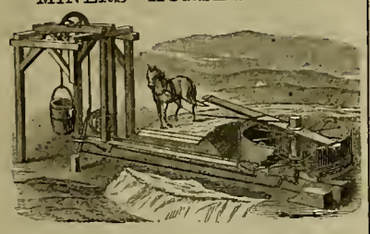
The Only SAFE BOILER. SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$3 50
One man, per day	3 00
Wood, 1¼ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

Judge Wm. Webster, Paymaster Mine, Reno, Nev.
Lewis Chalmers, Manager Exchequer and 1XL Mines, Silver Mountain, Cal.
J. S. Cone, Vice-President Tchama County Bank, Red Bluff, Cal.
R. H. Campbell, Superintendent Afterthought Mine, Redding; Shasta County, Cal.

Mining Share Market.

The market has been rather insanely inflated during this week. Sierra Nevada has heen up to $214; Ophir to $98. These two risee may perhaps he reasonahly explained. Sierra Nevada assays have been very good, ranging from $399 to $700. In the main incline in the Ophir, at a depth of 2,166 feet, a new ore formation has been struck, giving license again to the sanguine prophecies, "reliable experts." But we have seen no' explanations of the general rise along the line to the south—Hale & Norcross from $16 to $44 in four days, and $22 of that from Saturday to Monday—Best & Belcher from $30 to $40 in five days—Gould and Curry from $18 to $23 in the same time—Savage from $18 to $28—Chollar Potosi, from $45 to $70—in short, a general rise along the whole line, which may he ascribed to the fever of gamhling, and not to anything happening in the mines. When it is said that such rises come from sympathy, it is merely intended to say just what we have expressed in the "fever of gambling." It is a kind of sympathy which will be of little consolation to those, who huy at these inflated prices expecting greater inflation. It has been hinted hy cautious conservatives, that the rise is the result of some cunning ring trick. Who can tell? Tuesday was the culminating point of most of the stocks from Utah south, to Alpha. Further south there has continued to be a general upward tendency. The jump in Alta, from $17 to $30, seems to he looked upon with great distrust, it heing based upon very untrustworthy reports.

Outside stocks have been entirely neglected hy the excited market. The overlookiug of so many valuable mines as are to he found away from the Comstock, presents further argument in favor of the opinion that the present inflation is the result of excitement merely. Bodie is recovering itself, having reached $26. The other Mono mines do not yet attract market attention. Wo notice that the San Xavier mine, of Arizona, has heen listed at the S. F. Exchange.

OUR AGENTS.

Our Friends can do much in aid of our paper and the canss of practical knowledge and science, by assisting Agents in thsir labors of canvassing, by lending their influence and encouraging favors. Wo intend to send none but worthy men.

J. L. Tharp—San Francisco.
B. W. Crowell—California.
A. C. Knox—Pacific Coast.
C. N. Webt—Santa Cruz, Monterey and San Benito counties.
A. C. Champion—Tulare, Fresno and Inyo counties.
W. D. White—San Bernardino county.
J. W. A. Wright.—Tulare, Fresno and Kern countics.
E. M. Denny.—Oregon.
H. E. Hallett.—Stanislaus county.
G. W. McGrew.—Santa Clara county.
Richard Allen.—British Columbia.
R. D. Nunnally.—Siskiyou County, Cal.
Dr. W. G. Aldan.—State of Nevada.
Edward Dugan.—Washington Territory.
Mrs. Carrie F. Young.—Nevada and Sierra counties.

For Printing Materials, the publishers of this pape patronize Marder, Luse & Co., Pacific Type Foundry and Printers' Supply Warehouse, 532 Clay street, San Francisco, Cal. Send them a stamp for specimen sheet, and say advertised in this paper.

Patents and Inventions.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch from Washington, D. C.

Week Ending September 10th, 1878.

Check-Rein Hooks—David H. Clippinger, Brighton, Cal.
Steadying Gauge and Glass Tube Cutters — William Heyn, S. F.
Screw Cutting Lathes—Alpheus F. Cherry, Albany, Ogn.
Ore Washers and Amalgamators — John H. Hobart, Oakland, and John T. Best, S. F.
Hooks—Frank Kortick, S. F.
Detritus Pumps—Eugene Morean, S. F.
Furnaces for Roasting Ores—David J. O'Harra, Reno, Nevada.
Refining Base Bullion—Leopold Halback, S. F.
Trademarks—A. M. Fletcher and James McCoy, S. F., paint.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest tiue possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Union Reading Rooms, First Street, San Jose. Welcome to All!—Having lately been removed to the old hall of the City Zouaves, this institution is located in a pleasant and spacious apartment. The latest and best eriodicals of the day are found on its tables, frae to all. Also many choice volumes upon its shelves. Good music Is provided for every Wednesday evening's social. Admission [to these entertainments, 25 cents—to pay expenses.

Woodward's Gardene were nsver more attractive than at present. Besides three lions already mentioned, six monster living alligators, several iguanas and a boa-constrictor have just been added. New stars are constantly engaged for the Pavilion exercises. Rates of admission as uaual.

Examine the accelorative sndowment plan, as originated by the Mutual Benofit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. ' Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

Union Free Reading Room, Sal Jose, Cal., Sept. 20, 1878.

Mr. A. T. Dewey.—*Dear Sir:*—The package of assorted fileholders (your patent) are received as per order, and permit me to say they are far superior to any other handy fileholders that I sver saw. Truly yours,

S. H. Herring.

Settlers and others wisbing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appears from time to time in this paper.

Tickets must be purchased before 11 A. M. on day of sailing, at Wharf office.

For freight or passage apply at the office corner First and Brannan streets.

WILLIAMS, BLANCHARD & CO., Agts.

Mining and Other Companies.

Persons interested in incorporated ehares will do well to recommend the publication of the official noticee of their companiee in this paper, as the cheapest appropriate medium for the same.

Keystone Quartz Mining Company.—Principal

pical place of business, San Francisco, California. Location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of August, 1878, an assessment of fifty (50c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at the office of the Company, northwest corner Pine and Sansome streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of October, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-eighth day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Hackberry Mill and Mining Company.—

The regular annual meeting of the stockholders in the Hackberry Mill and Mining Company, for the election of five Directors to serve during the ensuing year, and for such other business as may properly come before the meeting, will be held at the office of the Company, No. 306 Clay Street, San Francisco, Cal., on Monday, the seventh day of October, 1878, at the hour of 12 o'clock noon.

ED. B. PARTRIDOE, Sec'y.

Orion Mining Company.—Location of Prin-

cipal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Summit Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D., 1878, an assessment, (No. 5,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the nineteenth day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (83) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

Vigorit Powder Company.—Location of

principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) lovied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee	30	437½	$218 75
Louis McLane, Trustee	32	½ of 875	218 75
G W Crayson, Trustes	62	1312½	056 25
H H Shinn, Trustee	91	400	200 00
H H Shinn, Trustee	92	400	200 00
H H Shinn, Trustee	93	400	200 00
H H Sbinn, Trustee	94	112½	56 25

And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

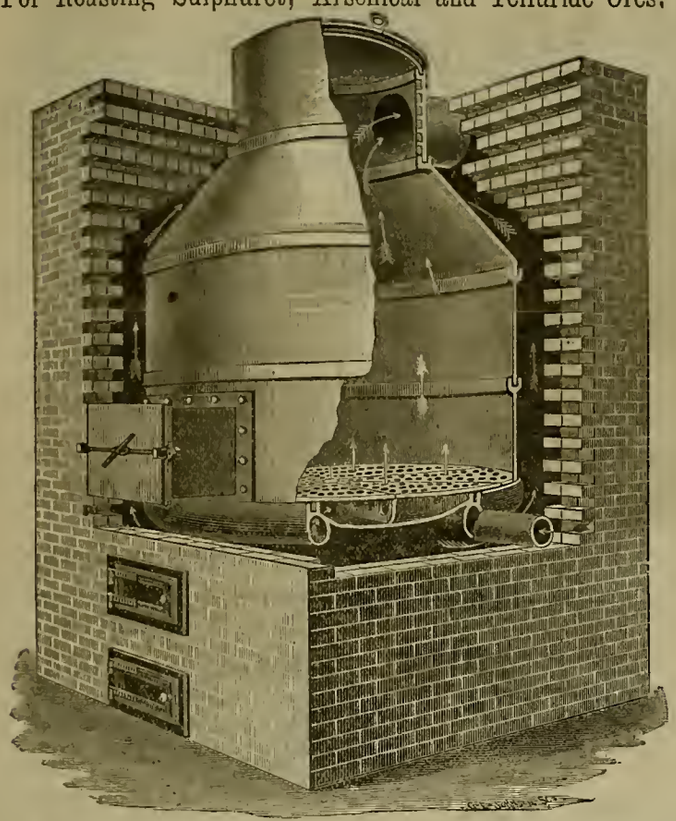
E. & F. N. SPON, 446 Broome St., N. Y.

Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arsenical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

Z. A. WILLARD, Patentee,

No. 1031 Market Street,

SAN FRANCISCO.

EDISON'S ELECTRIC PEN and PRESS.

MAKES 5,000 COPIES FROM ONE WRITING.

Requires no Prepared Ink or Paper, no Skilled Expert to do good work.

From 5 to 15 Copies per Minute by an Office Boy.

Indispensable to Lawyers, Bankers, Colleges and Schools, Music Dealers, Real Estate Men, and Business Firms in every department of trade.

Costs but $2.50 Per Annum to Run It.

WHAT THEY SAY:

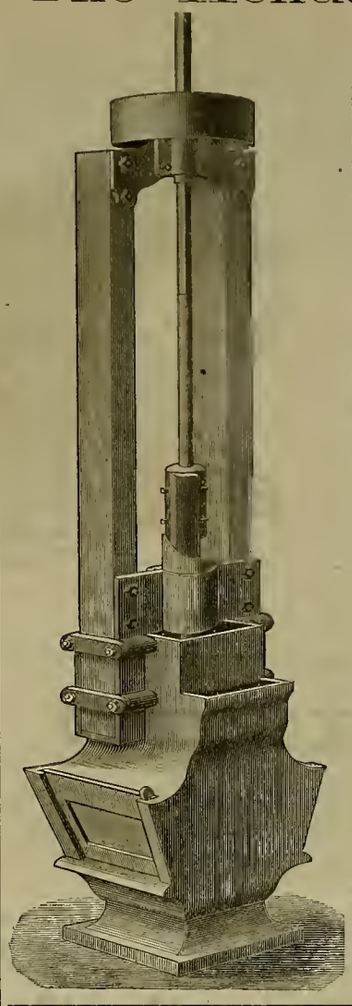
SUMMER RESORT.

Exhiliarating Climate! Grand Scenery!!

☞Persons intending to spend a few weeks in the country during the summer months should stop at the Bridge House, on the South Yuba. Accommodation may be had for a few more boarders by addressing Mrs. R. H. Culbertson, Emigrant Gap. House only one mile on the station.

The Kendall Battery.



STEPHEN KENDALL, Patentee.

This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For Prospecting Purposes this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

MANUFACTURERS,

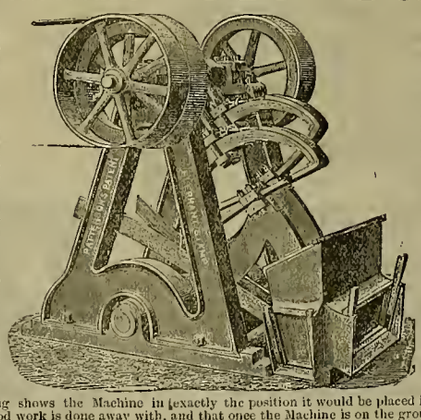
Pacific Iron Works, San Francisco.

Elephant Ore Stamp.

We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

Capabilities.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

Wear.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-



brace, uniting the lever with the spring, would only require replacing at most, once a year.

Power.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

Portability.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco. For particulars, apply to

EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

GOLD, SILVER AND COPPER MINING, Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills. Manufactured by M. C. BULLOCK.

FORTY ACRE FARMS.

In offering the Reading Ranch for sale in sub-divisions, I am disposed to accomodate the interests of all classes of desirable settlers, I therefore offer (besides large tracts) to sell farms (in favorable locations) of from 40 to 100 acres, at from $20 to $30 per acre. Semi-tropical fruits, corn, vegetables, and all kinds of grain and grasses, (including alfalfa,) will grow well without irrigation on these lands. The Oregon Division of the C. P. R. R., and a brisk growing town are near the land on the west, while the Sacramento river is near at hand on the east.

For further information of the Reading Grant, see my advertisement which appears from time to time in this paper. Address the proprietor on the premises,

EDWARD FRISBIE,
ANDERSON, SHASTA COUNTY, CAL

The "California Legal Record."

The ONLY WEEKLY containing all the decisions of the Supreme Court of California.

(The ONLY COMPLETE continuation of the S. F. *Law Journal*.)

Published every Saturday, in 8 vo. size—like the California Reports—contains EVERY DECISION of the Supreme Court, as fast as rendered, with a syllabus and statement of facts, and other important legal matter. The volumes commence on the first of October and April each, and have a full index for reference and binding.

REDUCED PRICE, only $5.50 per year, or $3 per volume of six months. Remit by Postal Order or Registered Letter, specifying what date or number to commence. Back numbers furnished. Sample numbers sent free. Address,

F. A. SCOFIELD & CO., Publishers and Prop's.
No. 603 Washington street, San Francisco, Cal.

IRON PIPE

FOR GAS AND WATER.

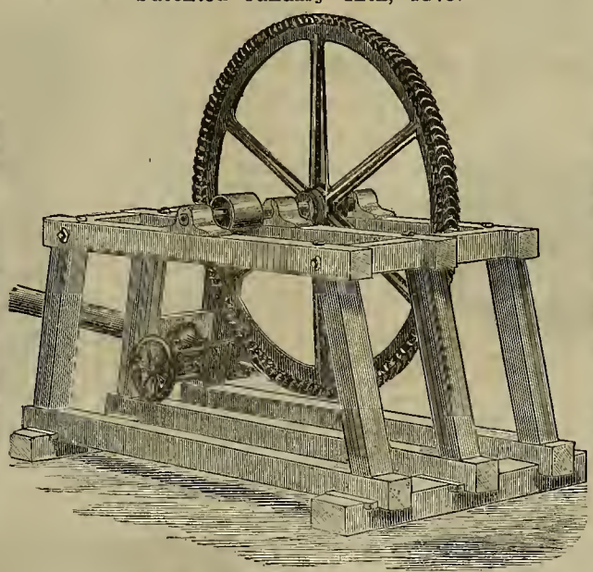
LARGEST STOCK AT LOWEST PRICES.

BARKER & SNOW, - 408 Market Street, - SAN FRANCISCO.

Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1–Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Rob't Robinson, Supt.
1–Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1–Eight-foot wheel, running Lincoln Gold Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
1–Eight-foot wheel, running pump at same company's mine. S. D. R. Stewart, Supt.
1–Eight-foot wheel, running Keystone Con Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2–Four and one-half foot wheels, used in hoisting by reversible water power at same company's mine. O. C. Hewitt, Supt.
1–Four and one-half foot wheel, running Original Co.'s Mill, Amador county, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1–Four-foot wheel, running Gover Mining Co.'s new Mill, Amador county, Cal.; 20 stamps.
1–Eight-foot wheel, running same company's old Mill; ten stamps. John Palmer, Supt.
1–Six-foot wheel, running Talisman Mining Co.'s Mill, Amador county, Cal.; ten stamps.
1–Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1–Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; ten stamps. John Palmer, Supt.
1–Four and one-half foot wheel, running Gold Mountain Mining Co.'s Mill, Amador county, Cal.; ten stamps. J. C. Goodman, Supt.
1–Six-foot wheel, running St. Patrick's Mill, Newcastle, Placer county, Cal.; 15 stamps. Jno. Townsend, Supt.
1–Eight-foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s Mine, State of Nevada.
1–Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; ten stamps, Oregon.
1–Four and one-half foot wheel, running Republic Mill; 20 stamps, Nevada county, Cal. E. H. Dyer, Supt.
1–Six-foot wheel, at the Plumas Eureka, running 48 stamps, two pans, two rock-breakers. Wm. Johns, Supt.
2–Six-foot wheels, sent up to Sierra Buttes Mines, one to run 50 stamps and the other to run pans.
1–Six and 2 Four and one-half foot wheels, sent to Saulsburg Mine, Sonora, Tuolumne Co. J. Leechman, Supt

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, OCTOBER 5, 1878. VOLUME XXXVII Number 14.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BELL FOR TRAP SHOOTING.—H. P. Fletcher, S. F. It has bean the custom of lats to use fragile glass balls as marks for practics in matches in what is known as wing or trap shooting instead of sbooting at pigeons or other birds started from a trap as formerly. These glass balls are usnally thrown into the air from a spring trap mads for the purpose, and when auy of the shot from the gun strike the glass ball, it is broken, hy which it is known that the marksman's aim has been accurate. This styls of shooting has como greatly into vogus of late, both with shot guns and rifles, but it is readily understood that when so many glass balls ars destroyed the amusement is an expensive one. Mr. Fletcher provides as a substitute for the glass balls a circular hell or sounder mads of metal, which will indicate by sound whsn it is struck, bnt which may be used over and over again. It is thrown from an ordinary spring trap the same as the glass balls. The sounder is composed nf two hemispherical mstal bslls joined togethsr by a metal stem so as to form a sphere, a small space being left between them.

DRIVING ATTACHMENT FOR WASHING MACHINES.—T. A. Wilson, S. F. This invention relates to an improvsd apparatus for operating on clothes pounders or washing machines, and it is specially applicahle to a dsvice patented April 22d, 1873, by D. B. Ransom, the right to use which has been purchased by Mr. Wilson. This washing pounder has an arrangement of air passages and valved handle to facilitate its action and rsnder the operation of working more rapid and thorough. It was found in practice, however, that although the device was very efficient fnr the pnrpose intsnded, it is tiresome and laborious to operate. Mr. Wilson, then invented this operating mechanism for the pounder. It consists nf an arrangement of spur, pinion and crank shaft, operated by a handle, which gives a vertical motion to a pitman on which is sscured an operating har carrying the pounder on the outer end. The bar is so secured to the pitman as to have a motion about it and is capable of adjustment in any position. The arrangement materially lessens the labor of operating the clothes pounder.

LINK CONNECTION AND LOCK.—Frank Kortick, S. F. This link connection and lock is intended more particularly for use in connection with ths bits on barness, or as an attachment on ths wbiffletres by which ths tug is connected to them. Mr. Kortick's device is a hook which receives the link, the book being so pivoted that its center of motion is in the center of the circular head of the connecting bar, and the point of the hook lies so near the edge of this disk that it prevents the link or ring from being removed, unlsss the hook is turned to a point where a semi-circular notch is formed on the head, so that the ring may drop into this notch and allow the hook to swing past it, when it may bs removed. At all other times it will he securely locked in place. The advantages of this link are the single method hy which the connection is made or unmade, and the impossihility of unlocking it, excspt when desired.

ATTACHMENT FOR SCREW CUTTING LATHES.—A. F. Cherry, Oregon. This invention relates to an attachment for scrsw cutting lathe, and a novel method of smploying tbe sams by which the operator is enahled to gauge the scrsw threads to be cut and also to determine the point of commencement for every fresh cut of any screw thread required, and by which he is enahled to do away with the necessity of running the lathe backwards after each cut has been made, and then gauging evcry fresh cut of the screw correctly, to work a perfect and regular thread as desired. Greater rapidity will be attained by the use of this attachment when cutting a scrsw thrsad than by the usual msthod of opsrating a screw cutting lathe.

STEADYING GAUGE AND GLASS TUBE CUTTER.—Wm. Heyn, S. F. This invention relates to a novel construction nf an apparatus for cutting tubes, and it consists in an adjustible cutting dsvice, operating from the interior of the tube, and a steadyiug and cantering gauge for the length to he cut. The devics is of great conveniencs for tube cutting of all kinds, but is especially valuable whenever the exterior of ths tnbe is not easily got at. It is more especially intended for cutting glass tubes such as are employed for gauges, etc.

SAMPLE CARD.—S. Kutnow, S. F. This is a card for exhibiting patterns of clothing, and also a sample or samples of cloth suitable to be made into articles of clothing of the particular patterns represented, the whole combined with the business card of ths merchant, tailor, or dealer in cloths. It is intended more particularly for the use of traveling solicitors.

BLIND WIRING MACHINE.—Carl Hinz, S. F. This invention relates to certain improvements in that class of devices, which are employed to drive the wire staples which secure movable blind slats to the rod by which they are operated, and it consists mainly in a novel combination of operative parts. The construction is such as to secure accuracy and keep the slats and rods in proper position under the driver.

SEED PLANTER.—W. T. Easterday, Watsonville, Santa Cruz county. This invention covers certain improvements on a former one hy the same inventor, and consists of certain improvements, changes and additions, which simplify the construction of the machine, and render it more convenient to keep in order. A detailed descriptiou would be unintclligihle without the aid of engravings.

MESSRS. Blake and Walton, Philadelphia millwrights, havs just sent to the United States of Columbia two complete flour mills, as well as a lot of sugar machinery, which were purchased by a gentleman lately a resident of this city.

THE immense yield of the silver mines in the new district at Leadville, Colorado, has produced an extraordinary influx of miners and capitalists. Three railroads are extending branches towards Leadville.

Driving Nails or Spikes Under Water.

William Stack, of Oakland, has rscently patented through ths MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for driving nails nr spikss undsr water, an engraving of which is shown on this page. It is well-known that it is extrsmely difficult to drive nails or spikes under water, sven if it is only submerged a few inches. In constructing piers, wharves, or sea-walls, and in work of like character, it frequsntly happens that a considerabls portion of the work is delayed, wbich can only bs accomplished at low stages of the tids. If oails or spikes even be driven under water soms of this delay can frequently bs avoided. Again, it sometimes become necessary to remove articles which are submerged and which cannot be taken hold of, but which, if proper supnorts, or handles could be nailed on, could be grappled or raised. These difficulties are obviated hy Mr. Stack's device, which has been put in practical operation in ths construction of wharves and slips in the Oakland side of the bay.

Fig. 1 shows the application of the device, and Fig. 2 shows the construction. *A* is a metal tube of suitahle length, the foot of which may he serrated as shown, so that the points will engage with the wood when the tube is pushed or driven against it. The rod or driver, *C*, has a recess or cavity, *D*, at the lower end so as to rest on top of the nail or spike shown in Fig. 2. Where the tube, *A*, is pushed against tbe timber in the desired position, the spike or nail is dropped in at ths upper snd and slides down against the timber. The rod, *C*, is then slid down on top of the nail and hy alternately drawing out and forcing ths rod into the tube, the rod serves as a driver; or hy hammering on the upper end of thc rod the nail is driven into the wood. The tuhe answers hoth as a guide for the nail and driving rod. The tube can also answer as a guide for a screw-driving device on thc end of the rod, by which lag screws may be put in place under water as well as nails. Of course the tubs may be set in any position dsired, so that nails may be driven at an angle if necessary. The appliance will be found very useful in many cases for bridge building or similar purposes. The inventor may be addressed N. E. corner Fifth and Harrison streets, Oakland, Alameda county.

FIG. 2.

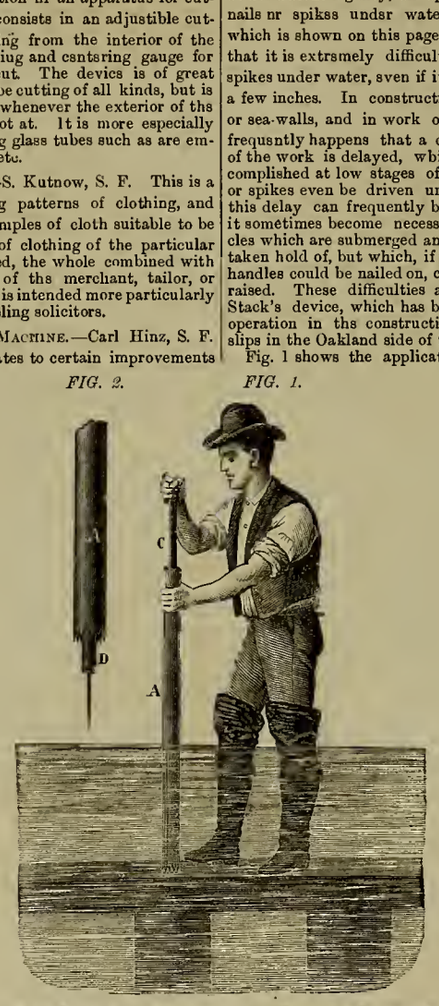

FIG. 1.

DEVICE FOR DRIVING NAILS UNDER WATER.

E. MERRIFIELD has purchased, conditionally, all but 400 of the 20,000 shares of the Nevada or Soggs' mine for $75,000.

Wythe's Manual of Microscopy.

We bavs greatly enjoyed the psrusal of a work which is a credit to scientific progress on this coast. It is "The Microscopist," a manual of Microscopy, etc., by J. H. Wythe, A. M., M. D., Professor of Microscopy and Biology in the Medical College of ths Pacific. Dr. Wythe snjoys the distinction of being a pioneer in microscopic work. For more than a quarter of a csntury a smaller manual which he wrote has beld a firm place in the estimation of microscopical students, and the present handsome volume is ths fruit of studies which have kspt the author well abreast of ths progress of microscopy since his smaller treatise was written. A particular interest pertains to the work on this coast because ths author is a Californian—a leader in medical science as well as in microscopy. He has done a prominent share of the scientific work which has given our Stats an honorable place in scientific annals.

Of the "Manual of Microscopy" we have not space at hand to speak in detail; suffice it to say that it is a handsomely printed volume of 259 pages, adorned with 205 plates and engravings carefully drawn and engraved. In its plan the text embraces both general and special points; for instance, the reader who desires to know what progress nicroscopy has made in the different departments of investigation, and the beginner with the microscope who desires to know how to make a cement cell, will both find the book answering their questions concisely and yet comprehensively. We find the hook particularly lucid on the construction of the microscops and its accessories. In this department Dr. Wythe is unexcelled. We think ths book may be beartily commended to the practical student and the general reader as an ahle exponent of the present condition of microscopical science. It is published by Lindsay & Blakiston, of Philadelphia, and can bs had, we presume, at the book stores in this city.

The Mines and the Courts.

J. C. Sunderling sues the California Con. G. M. & M. Co. in the Twelfth District Court to recover $16,187. 40 on a promissory note.

In the Fourth District Court, H. J. O'Railly and wife sue J. C. Flood and ths bonanza firm for $150,000 alleged to be duc on a contract for honanza stock. While the jury was being impansled in this case, N. A. Son, one of the jurors, said hs had been approached by an unknown man, who said if he got on the jury "there was some money in it." Judge Wheeler excused Sou from serving on tbe jury, and reqnested him to try and find the man and report him to the Court. Another juryman named Hathaway said that two men called at his store a fsw days ago and spoke of the case, but made no proposition to him.

The Secretary of the Interior in a letter to the Attorney-General September 26th, declines to advise the institution of legal proceedings to sst asids patents issued for the Tioga and Oscela mining claims in ths Bodie district, California.

There were filed Ssptemher 26th, satisfaction of a mortgage upon the Wells-Fargo mine of $4,000 and interest, made in favor of H. T. Fairhanks, and satisfaction of a mortgage upon the sams mine for $6,000 and interest, also made in favor of H. T. Fairbanks.

On September 21st, several men at work on the Pioneer mine, North Virginia, were driven off the grounds with shotguns. It seems that a majority of the claims and orders against the mine are in the hands of Messrs. Bass and Aurich, who probably did not relish having their claim taken possession of hy outsiders.

J. S. PHILLIPS has gone to Nevada to examine a very peculiar deposit of silver ore. The ore is found covering a large district. The silver is said to occur in very strange formation. We hope to hear further from Mr Phillips.

The Ocean Placers of San Francisco.

[A paper read before the Chemical Section of the California Academy of Sciences, August 30th, 1878, by S. B. Christy, University of California.]

Mr. President and Members of the Chemical Section:—The short papsr which I present this evening is perbaps better adapted to a geological or mining section than to our own, but in view of the liberal interpretation which was put upon our organization, I present tbese few pages to you.

It bas long been a favorite idea with me that tbe geologic study of the hills and valleys, rocks and coastlines, islands and sea bottoms of the Bay of San Francisco, with its surroundings, was the peculiar province of the residents of this region. But strangely enough, wbile extensive investigations bave been made of remote mountaiuous districts, there is very little to be found of value upon this most interestiug region.

It seems to me that geology, like charity, begins at bome, and so, in accordance with tbis belief, I present tbe few facts that I have been able to glean from reading and observation upon tbe gold placers, whicb bave been lately discovered on the ocean beach of San Francisco.

These beach sands are reported to have been prospected some 15 years ago, but though gold was discovered it was not in quantity sufficient to pay the expense of working. Much attention has of late been directed to the subject of beach mining, and within two months back the discovery of gold in paying quantities seeme to be established beyond doubt, chiefly owing to the exertions of Mr. John Frazer, the new discoverer, and other old miners and prospectors. Since the discovery the whole of the beach from north of the Ocean Side House as far south as Point San Pedro has been takeu up by various claimauts. Four of the claims are heing actively worked at present, and two of them are reported to have togetber taken out about $800 for two weeks' work.

As a discovery it is probable that it is not a very rich find, but as far as can be seen at present there seems to be sufficient gold to pay fair day wages. Tbe pay per man has heretofore varied from two to eight dollars, according to tbe statements of the miners.

The Nature of the Deposit

Is very much what is usual in such cases. There are alternating layers of magnetic iron sand aud of common quartz sand upon the higher parts of tbe beach, wbile lower down where the surf breaks, the sand becomes usually coarser and more full of pebbles. Layers of black sand are not infrequently found upon the top of the partly dried, undisturbed sand, owing to the removal of the lighter eilicious material hy the action of the wind. As one digs down tbe layers alternate white and black, the thickness of each varying from that of a knife edge to tbree and six inches. At lengtb, at a depth of from two to four feet, the "hard pan" is reached. Tbis hard pan is composed of a sort of clay sandstone, of which more hereafter. Upon this hard pan is usually found a layer of coarser sand or gravel, which, especially when found in depressions and crevices which favor a concentratiug action of the waves, is usually the "best pay" found. But some of the bigher layers of black sand are quite rich also. They seem to he formed upon a "false bottom," as the miners call it, by some high tide which makes a new deposit, wbile its waves are not violent enough to disturb the previous deposits.

The Concentrating Action of the Waves

Upon an inclined beach must be considerahle. The configuration of the heach is entirely changed after a storm, and the whole beach as far nn as the cliffs is entirely covered hy the surf during heavy weather. The action of the water on the sands is essentially the same as in tbe miners' pan. Tbe quartz sand, with a specific gravity of only two and onc-half, whilc that of the magnetic oxide of iron is usually ahout five; hence the separation of these two materials is tolerably complete. The other heavy materials, as gold and platinum, natuially remain with the magnetic saud.

Under the Microscope

The black sand shows itself to be composed of more or less perfectly rounded grains of magnetic oxide of iron, with a few silica grains and occasional fragments of what appears to be garnet. Mixed witb the black sand is the gold, which, under the microscope, is almost invariably bright, and in only a few cases presents a rusty appearance.

Tnc spccimen to wbich I call the attention of the Section, is part of the concentrations from the blanket sluice of the Frazer claim, which were afterwards concentrated still furtber on the shore. It is, tberefore, very much richer than the ore as it is found.

The specimens were mounted opaque with an asphaltum backing for me by Mr. X. Y. Clark, of tbe S. F. Microscopical Society. The gold, it will bs seen, is invariably in tbe form of oblong or elliptical scales, which are doubly concure, and are usually surrounded by a thickened rim.

A number were measured hy Mr. Clark, and gave the following dimentions:

0.0065 inches.	Largest.	0.0030 inches.
0.0060 inches.		0.0030 inches.
0.0070 inches.		0.0035 inches.
		0.0035 inches.

Smallest.

Average thickness of the rims of the scales, 0.001 inches.

A number of measurements made by myself of particles contained in tbe spscimen on exbibition gave the following resnlts:

Gold ..... 0.0108 in., 0.0098 in., 0.0049 in.

Platinum occurs also, though not in large quantities. Several fragments are discoverable in the present specimen. The fragments are usually more compact and less flattened tban the gold particles. One specimen measured 0.0044 inches.

Now as tbe particles of magnetic oxide are very nearly of the average diameter of the gold particles, and as, moreover, tbey are rounded, it becomes a matter of the greatest difficulty to separate tbem by wasbing in spite of tbeir great difference of specific quantities, which are as five to nineteen. The leaf-like form of the gold renders it practically as easily moved by water as tbe magnetic oxide. It is only by tbe skillful touch of an old miner that a good "color" can be sbown in the pan.

The Method of Treating the Ore.

Whicb varies all tbe way from notbing up to $25 or $30 per tou, is to either pass it with water down an ordinary hlanket sluice or to use a combinatiou of amalgamated copper plates, riffles, hanging plates, etc., sucb as the Russel Amalgamator described in the Mining and Scientific Press, August 17, 1878, p. 97. Both of these methods seem to work to the satisfaction of the parties interested. Accurate experimeuts as to their relative effectivencss have not beeu made as yet.

From experimeuts of my own, I find that the gold amalgamates very freely, as one would naturally infer from its brightness, and freedom from rust. Tbe finer particlcs, wben once allowed to dry, seem to become covered with a film of air, so that when again wet with water they float upon tbe snrface. Anotber curious fact is the great purity of tbe gold. Falknean and Reese report the gold which they assayed as from 950 to 953 fine. The miners frequently treat their concentration before amalgamating with a little nitric acid to remove the iron rust (which, by the way, does not seem to be present). It is not prohable tbat this dissolves the silver from the gold as these concentrations are still wet with salt water. It, therefore, appears to he more probable that the silver is removed hy the long action of the salt water upon those thin scales, which are only a thousandth of an inch thick in their thickest part. However this may be, it is reported to be the purest placer gold that has been found in California.

The Location of the Deposit

Is best shown hy Plate 14 of the United States Coast Survey Reports for 1869. The region is shown on the map from a couple of bundred yards north of the Ocean Side house uninterruptedly to Mussel rock, and then on tbe otber side of this point the auriferous sands seem to extend to Pt. San Pedro. These deposits have not been tboroughly prospected. From ahout one mile south of tbe Merced creek to Mussel rock there are steep bluffs from about 250 to 500 feet high. These bluffs form an elevated table land covered with a meager soil. Tbsy slope back to the valley, through which runs the Soutbern Pacific railroad. They are composed of alternate layers of a soft yellow sandstone and of conglomerates of small pebbles. There are occasional streaks, a foot tbick, of a firmer white sandstone, a specimen of which I suhmit. There is, more particularly toward Mussel rock, a stratum of a very earthy lignite which seems to be of no .value. At another point, near the Combinatiou claim, there is an outcrop, about six to eight feet thick, of a blueisb clay sandstone coutaining a large number of fossil shells.

Thie locality is thus described in Vol. I., p. 79, Geological Survey of California:

"Although the miocene tertiary sandstones, which form so conspicuous a member of the Coast ranges, are not exposed in the vicinity of San Francisco, there are somewhat extensive outcrops of rocks of a later tertiary in the low bills extending along the seashore, southeast of Merced lake, nearly as far as Mussel rock.

"According to tbe observations of Messrs. Remond and Gubb, there are two sets of strata here which helong to the pliocene and past pliocene epochs, and which are unconformahle with each other.

"Both these formations rest also unconformably on the metamorphic cretaceous, as does also the miocene in the region north of tbe Golden Gate, while this formation appears to be wanting throughout the northern end of the peninsula of San Francisco.

"The pliocene beds between Merced lake and Mussel Point are made up of a blueish sandstoue, of which the grains are cemented hy carbonate of lime, interstratified with hard, fine conglomerates, of which the pebbles are evidently derived from the adjacent jaspery rocks of tbe cretaceous age.

"These strata contain *Scutilla interlineata, Crepidula princeps*, hoth of whicb are extinct, together with several species still living on this coast. The Post Pliocene eeries consists of heds of gravel, sand and clay, with some soft sandstones and contains ouly shells of recent species, amoug whicb the genera *Tellina, Mytilus, and Buccinum* are represcuted. Of these two sets of heds, the lower, according to Mr. Remoud, have a northwest strike and dip to the northeast at an angle of 35°, while the upper have an incliuation of only 10°. This is ouly one of a uumerous class of facts which show tbat there bave been quite extensive disturbances of thc rocks along the coast within a very recent geological opoch."

The Origin of the Gold Deposit

Is a question full of interest and difficulty. Without attempting to solve the question myself, I sball present several possible explaua-tions, leaving futurs investigation to deoide the question.

In the first place, bowevsr, one tbing is certain. Tbe gold is "float gold," and has been brought some distauce by tbe carrying power of water.

To give an idea of the geology of tbe surrounding country, I quote again from tbe "Geology of California, p. 64." "Gold occurs on tbe eastern slope of tbis ridge, but probably not in paying quantity, although a considerable amount of ground bas been washed over."

Do., p. 72: "In the region to the southwest of the tertiary and metamorphic cretaceoue belt which has just heeu described as extending along Mt. Bache to Searsville, and forming the center and easteru edge of the Santa Cruz range, tbere is a higb range of granite hills, of which the southern termination is near the town of Santa Crnz, and where a great deal of prospecting for gold has beeu doue. It is stated on what is believed to he good authority, tbat at least one quite rich mass of auriferous veinstone has been obtained here. There does not, however, seem to be any prospect of permanent, profitable working for tbis metal at tbis point, as no well defined vein could be traced."

Do., p. 76: "The great regular ranges of mountains which form tbe peninsula appear to run out to the north of Pt. San Pedro, and uo more granite is seeu on its northern end after passing the mass of the *Cumbre de las Auras*. The extremity of the peninsula is occupied by short aud brokeu ranges or low hills, in wbich the regular trend to the northwest can be no longer detected, bnt whence the influeuce of the east and west line of depression, by which the Golden Gate has been opened and access given to the interior, is manifested in tbe most chaotic jumble of strata which it is possible to find in the State."

p. 76. "Tbe granite range of the *Cumbra de las Auras* disappears heneath the ocean, but rises again to the north of the Golden Gate, in the promontory of *Punta de los Reyes*." A study of these considerations together with the topography of the surrounding country, as is so well illustrated by the map of the peninsula of San Francisco hefore epecified, and the Coast Survey chart of the "Eutrance to San Francisco bay," together with the Geological Survey map of Ceutral California, euggests the following as three possible explanatious of the deposit:

(1). That it came from some sub-ocean quartz ledge water worn hy wave action. This bas some slight foundation in the fact specified that the granite range, gold-bearing near Santa Cruz, stretches beneath tbe ocean from Point San Pedro to Point Reyes. But this supposition is ou the whole hardly tenable.

(2). That tbe deposit is from tbe silts of the Sacramcuto river, whicb are carried out into the ocean and deposited when the tidal current ceases, and then washed upon the beacb. There seems to be eome foundation for this second theory. In the first place, *a priori*, we are all aware that a large amount of "float" gold must be in this way brought down the Sacramento river from the hydraulic washings which have gone on for so long a time. An examination of the map of the harbor shows very clearly how enormous an amouut of matter is deposited on the easteru side of the bay. In fact, it is probahle tbat the extensive tract of level laud on which are situated San Pahlo, Berkeley, Oakland, etc., has beeu deposited in a similar manner within a comparatively recent period of time. Again, a reference to the eoundings on the bar, as given on the Coast Survey chart, sbow in frequent places "hlack eand" (or mixtures of tbe same) as a bottom. I have not yet been ahle to ascertain from the Coast Survey office the exact nature of these sauds, but it altogether probable that the magnetic oxide is designated. The "hlack sand" seems to predominate on the bottoms west of the gold beach.

On the other band one would imagine that if it had such an origin, the black sands would have been found in still larger quantities on the beaches between Black Point and Fort Point, and between tbe latter and the Cliff House. But from a rapid reconnoissance of these hcaches this does not appear to he the case. This might, however, he explained if one knew the direction of the currents. But tbey are only spoken of on the chart as being too irregular to admit of a clear description.

The third hypothesis is that the gold comes from the hluffs themselves. Tbe fact that the deposits nearly always occur at and around their base incline one to this opinion.

The third hypotbesis is, that the gold comes from the bluffs themselves. The fact that the deposits nearly always occur at and around their base, incline one to tbis opinion. Several prospectors claim to have discovered coarse gold in thc canyons which run hack from the face of the bluffs. I could uot ascertain with certainty the truth of these statements. But independently of this there are many considerations that would seem to indicate that this should be the case. The cliffs as they are situated are admirably adapted to the concentrating action of the waves. They are, moreover, of exactly the same nature as the gold bluffs of Oregon, as described in a paper hy Mr. Chase—Proceedings California Academy of Scieuces, Vol. V., p. 246, and in anotber read hefore the Academy by Mr. W. A. Goodyear in 1872, aud published in Mining and Scientific Press, Vol. XXV, p. 371.

The hluffs are evidently of sedimentary origin, and a study of the topography of the peninsula of San Francisco would seem to indicate that San Francisco bay bad at ons tims discbarged tbrough tbe valley whicb runs from San Bruno, northwest to Lake Merced, or perhaps more directly where the bluffs stand at prescnt. Tbe level of the ancient river bed would be now cbanged by the same agencies whicb opened the Golden Gate, and which Prof. Whitney remarks as having greatly complicated tbe folding of the strata of the entire peninsula. The non-conformability of the strata before spoken of would seem to indicate the eame fact. But there are not as yet sufficient data to decide upon such a question.

It seems tbat in view of the provcd origin of tbe gold in the bluffs of Oregon, that tbere is justifiable ground for making a thorough exploitation of the bluffs themselves. Very probably they will not prove rich enough to work. But in case they did so prove they migbt be easily worked by the hydraulic process by water from Lake Merced. This could be doue by tbe pumps now idle, which were erected then last year during the drouth for the supply of San Francisco.

In this connection there comes to mind a statemeut which occurs in a book called "The Annals of San Francisco," publisbed in this city in 1855. On p. 154 is tbe following statement, wbich seems to show tbat some of these geological changes have been more recent than one would have supposed.

"We may observe here, that there ie a tradition among the Indians of California that San Francisco bay originally formed a fresh water lake. An earthquake, however, suddenly opened tbe line of mountains along the coast, when the sea rusbed in and changed the region to what it uow is. The eurplus fresh waters of the old lake were supposcd to bave been discharged into tbe Bay of Monterey by a great river flowing through the valley of San Jose and Santa Clara. This river was believed to pass near the Mission of San Juan, and to fall into tbe present stream of the Pajaro."

We would remark in conclusion that at tbis same region similar gold eauds have been discovered. Also that tbe water off the Bay of Monterey is reported to he of a remarkahle depth. But the consideration of this latter problem would lead beyond tbe limits of the present paper.

Pacific Coast Mineral Exhibit at Paris. Tbe *American Register*, Paris, says of our mineral exhihit at the exposition: Every specimen of ore, rock, or fossil comprising tbis rich and interesting collection, bears a neatly printed label stating the nature and origin of the product. Tbe grouping bas been done very systematically, and Henry G. Hanks, tbe Commissioner for California, bas well understood how to make the exhibit at once an attractive display for the curioue and most interesting field for the student or learned geologist. The most complete of the State exhibits is unquestionably that of Oregon. Prentice Mulford, writing to tbe *Bulletin* on the same subject, says: The Pacific coast and all persons interested, have no reason to complain of their mineral exhihit here. It has compelled marked and appreciative attention. It has compelled more attention tban the average of American exhibits here. On the occasion of Commissioner McCormick's dining with Prof. Archer of the Edinburgh museum, a few days since, he (the Professor) complimented it in the warmest terms. Tbe Director of the South Kensington museum, London, has also expressed himself in similar terms. Mr. Hanks receives tberefor a Diploma of Houor from tbe Paris exposition of 1878.

A Metallic Shingle.—The *Iron Age* describes a metallic sbingle, for which many advantages are claimed. They wcigh only one-fourth as much as slate. The material used is hcavy sbeet iron, and after the shingles are cut out aud struck up to ehape tbey are coated with a plumbago or graphite paint for protection, which gives them a color almost exactly the same as the dark Pennsylvania slate. This covering is claimed to he exceedingly durable, and tbey say that if a final coating is given after tbe sbingles are laid, so as to cover any scratches which may have been accidentally given, a roof so laid will last for years. Each shingle is 8 by 16 inches; 277 are required to lay a square, as each course lies six and one-half inches to the weather, with a three-inch lap.

Mechanical Equivalent of Heat.—After another year's investigation the British Association's committee on this subject confirm tbe old figures, whicb give 772.55 foot-pounds as the equivalent at the sea level, and the latitude of Greenwhich, of tbe heat which can raise a pound of water weighed in vacuo from 60° to 61° Fab. in a mercury thermometer where the permauent freezing point ie called 32 and the permanent boiling point of water is 212. The work at present in hand is tbe more accurate investigation of the true position of the freezing point and the boiling poiut of the thermometer when cleared from the effects of the imperfect elasticity of tbe glass of which it is composed.

Superheated Water in Locomotives.—On the railroad connecting Rveil and Marly-le-Roi, France, it is said that thc experimeut of ruuning the locomotives by means of superbeated water bas given very satisfactory results. The water was introduced at a temperature of 180° C. If the trial turned out as well as bas been alleged, a motive power of this kind, may for many reasons, be adopted witb advantage on street railroads.

MECHANICAL PROGRESS.

The Latest Improvement in Gas Motors.

The *Gaslight Journal* translates from a French authority an account of recent improvements in gas motors. We take therefrom a brief description of the one which seems best contrived. The motive power in a gas engine is obtained by exploding behind the piston a mixture of ordinary illuminating gas with seven or more times its volume of air. The heat developed by the complete combustion of the gas amounts to about 6,000 calories per cubic meter (674 British units of heat per cubic foot), and raises the temperature of the gaseous mixture, after the explosion, to from 1,200 C. to 2,800° C., according to the greater or less excess of air that it contains. Part of the heat of the burned gases is transformed into motive force, by their pressure against the piston, as they expand; but the greater part is taken, in all the older engines, by the walls of the cylinder, which thus tend to become rapidly heated, and are kept cool by a water jacket. One of the most promising recent improvements is that of Herr Otto, of Cologne. Herr Otto's engine resembles in its general arrangement a single-acting steam engine, with a horizontal cylinder open at one end, closed at the other, and provided with a heavy fly-wheel. The cylinder acts, at the same time, as the compressing pump for the mixture of gas and air. The piston, at the bottom of the stroke, leaves between it and the closed end of the cylinder a space, the compression chamber, the volume of which is generally equal to two-thirds of that swept out by the piston, or two-fifths of the total capacity of the cylinder.

The complete period of the action of the engine is that comprised in two revolutions of the main shaft, or four strokes of the piston. The successive phases are as follows: (1) The piston advances towards the open end of the cylinder, and draws in the mixture of gas and air. (2) The piston returns and compresses the mixture to two-fifths of its original volume. (3) As the piston reaches the end of the stroke the mixture is ignited and again drives it forward. (4) Lastly, the piston returns again, driving out before it the greater part of the burned gases, and a fresh cycle of operation begins.

Thus, of four successive strokes, forming one cycle, one only, the third, transmits motive force to the shaft; the second, in which the gaseous mixture is compressed, consumes force; and the first and fourth are indifferent. Hence the necessity for a heavy fly-wheel. The supply of gas is cut off by the governor when the speed becomes too great. The valves admitting gas and air are so arranged that a feebly explosive mixture of 18 parts of air to one part of gas is first introduced into the cylinder, and then a smaller amount of a strongly explosive mixture of seven parts of air to one part of gas. As two-fifths of the volume of the cylinder, next to the piston, are already filled with inert gases, the mixture, from being most strongly explosive next to the port of admission, becomes less and less so nearer to the piston; and its explosion is thus rendered less instantaneous than that of a homogeneous mass of strongly explosive gas, while its ignition is ensured by the strongly explosive portion being that fired first, and a great part of the heat of explosion is employed in expanding the mass of inert gases contained in the cylinder.

ENGLISH TREATMENT OF INVENTORS.—In the course of a recent discussion in England on the progress of telegraphy, Prof. Graham Bell said that he would not be understood to intimate that invention had left the shores of England, but he would express his own personal experience of governmental control with regard to inventions. In 1874 he invented a system by which 16 or 20 messages could be sent simultaneously on a single wire. He received in reply a printed paper that the Post-Office would take into consideration the invention at the expense of the inventor, and, in the event of the improvement being adopted, the remuneration would be left to the consideration of the Postmaster-General. Personally the effect of government control had induced him to bring forward his inventions in America, and the result was the electric telephone. He thought that government control was necessary, but he feared that in most cases it was destructive of invention.

AN IMPROVED LEVEL.—J. B. Dancer, of Manchester, England, has made some improvements in the dumpy level for surveyors. He rejects the ordinary spider lines and places in their stead a transparent crystal plate firmly fixed on the diaphragm, upon which fine lines are drawn with a diamond point. The brass tube containing the level is double, the outer one being loose. When turned around it protects the glass tube when the instrument is carried about. The eye-pieces are made to focus accurately and easily on the cross lines by making one tube screw into another.

CHEAP ICE MACHINES.—A Paris correspondent says that there are on view at the Paris exhibition, ice machines of French manufacture, which may be purchased retail at about £6 apiece, and which are capable of turning out from six to eight pounds of ice in 90 minutes, at a cost of one farthing per pound.

Plumbago as a Molders' "Facing."

We notice that the use of plumbago as a facing in molders' castings is exciting the attention of European metal founders. Although this material has been used to a considerable extent in the country for some time, it will doubtless interest our foundrymen to read what their European contemporaries say of it. We quote from letters written to the *Ironmonger* of London.

A founder in Cadiz, Spain, writes as follows: Having for upwards of thirty years, been casting church bells for different parts of Spain, also a great many for the Philippine Islands, I also had a great difficulty in finding a wash sufficiently strong to avoid the silver and tin employed in the bell metal penetrating into the loam, and causing an immense deal of trouble in the cleaning of the bell. Last week I cast a large bell for the cathedral here, to which I applied plumbago powder as a wash, mixed with whiting and salt. The result was more than I anticipated, as on taking the bell out the loam left it without even the trouble of touching it, but dropped off of its own accord. I have also applied it to the casting of heavy gun metal castings and cast iron pieces, and in all it gave good results.

An English founder writes: We have carefully tried the use of plumbago, both in our iron and in our brass foundries—with a decided benefit in the sharpness and face of iron castings—that is by using plumbago for dusting the molds. Plumbago, pure and simple, and the better the quality of the plumbago the better the result; but in brass (yellow metal) and pot-metal castings neither the pure plumbago nor mixtures of plumbago and meal-dust, or plumbago and tan (or wood) ash was so satisfactory as would warrant its use in that way, whilst for heavy gun metal casting pure plumbago gives a clean face and a fine skin. The use of plumbago for yellow or pot metals we have found to be the best by first dusting the molds with pea meal, and then on that a slight dust of plumbago. With this we get splendid castings, quite equal to any American, both as to sharpness and cleanliness, admirably suited for steam valves to be left in the rough on their bodies, and effecting a very great saving in trimming and finishing polished goods.

AMERICAN FILE MANUFACTURE.—At the present time, says the *American Manufacturer*, by far the greater part of the files manufactured and used in the United States are machine-made in every part. Hand-cutting is still carried on, but mostly in a small way. There are a great number of shops making hand-cut files, producing from one to two dozen per day, but they depend chiefly on the profits of recutting. The statistics of the file industry of the United States may be briefly summarized as follows: There are seven manufacturers making machine-cut files, operating together about 275 machines, which at the present time are probably averaging 1,500 dozen files per day. These several companies also produce together about 200 dozen hand-cut files, making a total of 1,700 dozen per day as the product of the seven principal file-manufacturing companies. The smaller manufacturers before mentioned make only for local consumption, and seldom sell to the trade. Of the whole number not included in the seven already mentioned, probably not more than fifteen manufacture for the general market, and their aggregate production would not amount to more than 500 or 600 dozen per day. Probably the total production of the United States is about 2,500 dozen per day.

THE FRENCH USE OF COPPER TUBING.—In describing a fine exhibit of copper tubing at the exposition, the *Iron Age* says that Continental locomotive builders do not make their boiler tubes and fire-boxes of iron or steel, but employ copper and brass rich in copper. This preference is justified, especially as regards the tubes, by the following reasons: Iron tubes can only be used when the feed water makes little scale, which adheres to iron more strongly because the formation of rust aids it. Iron tubes, they claim, do not conduct the heat so well, and as copper expands more than iron, the contraction, in a certain measure, helps to loosen the scale. Besides, it is urged that copper tubes last very long, and that it does not cost more to make a new tube from an old one than to buy a new steel or iron tube. How far circumstances may warrant the differences which exist in American and foreign practice in locomotive building we do not know, but the extensive use of copper tubes abroad has led to a development of this industry to an extent which has no parallel in this country, and American mechanics cannot fail to admire the variety and finish of these French products.

SELF-REGISTERING ELECTRIC RAIN GAUGE.—This instrument was shown at the meeting of the British Association by Mr. Yeates, a small stream of water being provided as a substitute for rain. The water trickles from the reservoir and falls into a double-balanced bucket. The balanced buckets empty themselves as they are filled, each filling being equivalent to one-hundredth of an inch fall of the surface of the water in the reservoir. The motion of the buckets as they empty themselves makes and breaks connection with an electric battery, and by this means each fall of one-hundredth of an inch is self-registered on a dial. On a second dial the inches appear, and the rainfall in inches and hundredths of an inch can thus be read off at once without the slightest trouble.

SCIENTIFIC PROGRESS.

Occlusion of Hydrogen by the Metals.

In his notes of interesting things seen at the Paris exposition, Prof. B. Silliman writes to the *Engineering and Mining Journal* of the occlusion of hydrogen by palladium. The late Dr. Graham, of London, the distinguished chemist and Master of the Mint, first described what he called the *occlusion* of hydrogen in the pores of the most solid fused and coined palladium—a property in virtue of which palladium can imbibe, so to speak, more than a thousand times its own volume of hydrogen gas and hold it with great permanence at ordinary temperatures. This is not a fact of merely curious scientific interest; nor is it peculiar exclusively to palladium; for Dr. Graham found that some meteoric irons, especially that of Lenarto, which he specially studied, held also many occluded volumes of hydrogen gas which had accompanied the meteor from the regions of space. Considering the enormous condensation of hydrogen occluded in palladium, Dr. Graham was led to the not improbable suggestion that this element, which others before him had suggested might be a metal in vapor, must exist in palladium as an alloy, and he was thus led to propose for the metal the name "Hydrogenium." This class of facts has quite recently received great expansion by the researches of Dr. Wright, of Yale, who has followed the subject into the domain of astronomy, and drawn important inferences respecting the tails of comets and nebulæ as connected with the occlusion not only of hydrogen, but other gases in meteoric stones and irons. This curious subject, so full of scientific interest and fertile of speculation, has a magnificent illustration in the present exhibit of Messrs. Johnson, Mathey & Co., who show a disk of palladium within which one thousand volumes of hydrogen gas are condensed by occlusion—a volume of gas which would be represented by a column of 2,000 millimeters in hight and 100 millimeters in diameter.

The original palladium disk had exactly 100 millimeters diameter and a thickness of precisely two millimeters. It was, before imbibing the enormous volume of hydrogen which it now holds, perfectly flat; and it was ganged by a ring within which it exactly fell. Now this disk is a concave mirror, the new form being occasioned wholly by the molecular displacement due to the hydrogen it has absorbed; it no longer enters its gauge ring, for its 100 millimeters diameter are now enlarged to 102-5 millimeters, and its original weight of 187-3775 is now increased to 188-2882 grams. This remarkable absorption of hydrogen has no visible effect upon the luster, color or tenacity of the palladium-alloy of hydrogen, if indeed it be an alloy. The hydrogen absorbed by palladium enters this metal, when it is made part of the circuit of a voltaic battery, the gas usually evolved at the positive pole being then taken into the substance of the solid metal.

ATMOSPHERIC NITROGEN.—At a recent meeting of the Society for the Encouragement of National Industries in France, M. Basset read a paper on the researches which he had made to discover a means of obtaining ammonia at a low price and on a large scale through the medium of the nitrogen of the atmosphere. This question, of such importance to agricultural interests, has been the object of M. Basset's studies for more than a quarter of a century. The problem he proposed to himself was to generate nitrogen under moisture in the presence of nascent hydrogen. After explaining the various methods employed in his attempts to provoke this reaction, M. Basset announced that he had ultimately arrived at complete success, and was then in a position to turn out ammonia on a wholesale scale at the rate of five farthings a pound, and sulphate of ammonia at about four-fifths of that price. At the same time he deposited in the office a full description of the system he adopts, which was referred for examination and report to the chemical committee of the society. It needed scarcely be said that if M. Bassett's reported discovery is capable of practical application on the scale that he confidently believes, a complete revolution is at hand in the artificial manure trades and kindred industries.

THE METRIC SYSTEM.—A dispatch from Paris says that the International Congress on weights, measures and coins, on September 4th, unanimously adopted a resolution deploring the fact that England, Russia and the United States had not yet adopted the metric system. American and English delegates afterward passed a resolution petitioning the English and American governments to appoint a mixed commission to consider the adoption of the system by both countries.

LITERARY NOTE.—The good things promised in the October *Popular Science Monthly* will be soon ready. The number will open with an illustrated popular article by Prof. J. S. Newberry, of Columbia College, on "The Geological History of New York Island and Harbor," and will also contain articles by Bain, Huxley, Spencer, Kirkwood, Brooks, and other eminent home and foreign writers.

OVERCOMING THE IRREGULARITIES IN THE PENDULUM.—At the late meeting of the British Association, Mr. Denny Lane, of Cork, described an isochronic pendulum which he had constructed, as follows: (1) Changes in atmospheric pressure are prevented from reaching the pendulum by a hermetically closed case which surrounds it. (2) Changes in temperature are prevented by a surrounded envelope of fluid, kept at a constant temperature by a thermostat, in which the expansion of the fluid acts on a mercurial column, which increases or diminishes the supply of gas to a Bunsen burner. This contrivance antomatically maintains an unvarying temperature around the pendulum case, so that all compensation for change of temperature is unnecessary. (3) As the temperature and pressure remain constant there can be no change in the viscidity of the air surrounding the pendulum. (4) The oscillations are maintained by an electro-magnet contained in the case, the current of which is interrupted for a portion of every oscillation by a contact-maker placed outside the case. This is actuated through the walls of the case, by a small permanent magnet attached to the foot of the pendulum. Thus the case need never be opened after once the pendulum is erected, and the pendulum touches nothing but the spring by which it is suspended, and the air by which it is surrounded. (5) The current of electricity operating on the electro-magnet is regulated by a rheostat, which maintains the current at a uniform force. It was urged, therefore, that the current being uniform, the arc should remain uniform, as the retarding and accelerating forces were constant, and all changes in heat and atmospheric pressure were prevented. In a rough experiment with Fuller's bichromate battery, the arc of the pendulum had not diminished the 300th part of an inch.

ANCIENT SURVEYING.—Two documents of great interest to geometricians have been discovered among the contract tablets in the British Museum. Attached to two terra-cotta deeds of sale of estates near Babylon are neatly drawn plans of the property. One sale took place in the reign of Darius Hystaspes; one toward the end of that of Nebuchadnezzar. The latter deed relates to a plot about 8½ acres in area, bounded on the north side by the canal of the goddess Banituo. The names of the owners of all the adjacent lands are given, and the greatest care is taken in giving the dimensions of these plots of land. The whole is divided into three pairs of parallelograms, and check dimensions are taken to test the accuracy of the work. A semicircular portion on the east side is most carefully measured, both radius and circumference being given. The value of these documents as bases by which to fix both the linear and area measures in use in Babylonia is very great.

COAST SURVEY WORK.—The Santa Rosa *Democrat* says that the party executing the primary survey on the north coast have finished their observations on the Gualala mountain, and are moving their camp to Cold Spring mountain, in the range east of Point Arena. The points observed from the new station will be Noyo Peak, Two Rock Peak, and the highest point on the Pine Ridge near Ukiah, Sanel mountain, Gualala mountain and perhaps Cahto mountain. The theodolyte at Noyo will be elevated on a frame scaffolding one hundred and thirty-five feet in hight, the tallest structure for this purpose ever used on this survey. The first observation was taken on the Cold Spring mountain on Thursday. The officers in charge of the party are B. A. Colonna, E. F. Dickens and J. F. Pratt.

SUB-CHLORIDE OF SILVER.—C. Lea has shown by recent experiments that the black body formed by the action of light upon chloride of silver is not metallic silver, but only a sub-chloride. Quantitative experiments have shown that after five days' exposure of a thin layer of chloride of silver to the direct action of the sun, only about one per cent. was reduced. Researches with bromide of silver tend to show that with it an actual reduction to metallic silver takes place, as the blackened precipitate treated with nitric acid immediately yielded considerable amounts of the silver to it.

A BONY RIVER.—In Dublin there is a warehouse of a bone mill which contains several 1,000 tons of fossils of the Jurassic period—teeth, vertebræ, fibula, jaws and limb bones, which are thrown indiscriminately into the mill, which is of enormous power, to crush the harder than flint petrified bones. These are dredged up from the river Bull, in North Carolina, the largest deposit of fossil remains ever discovered. For fifty miles the river runs through petrified bones. They are first loosened by enormous crowbars worked on the principle of pile drivers, and then dredged up. This river yields several 100,000 tons of fossil bones each year.

NEW CHEMICAL ELEMENT.—It seems probable that a new element will be before long brought to light. Recently M. Soret found in the ultra-violet spectrum of gadolinite lines which belong to the spectrum of no known metal, thus confirming the opinion expressed some time ago by Marignac and Delafontaine, that gadoliuite contained other bases than yttria and the oxides of erbium and terbium.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MOORE MINE.—*Ledger*, Sept. 28: Opsrations havs now commenced in downright earnest looking to the dsvelopment of this promisiug claim. A contract for 40,000 feet of lumher has been let to F. Mace, and a quantity has already heen hauled on the ground. Several men are eugaged in grading at the mine, preparatory to the erection of a suhstantial building over the shaft. Powerful hoisting machinery is to be put up without delay. The property has fallen into the right hands to be worked with vigor.

ITEMS.—The Oneida mine has started to sink. The Montirichard mine is running nnder favorable auspices. The uew reservoir is all completed, and full of water. The Pennsylvania mine at New Chicago, is likely to he started again soon. Notices are up inviting bids for a contract to sink an additional hundred feet. The Centennial mill is about completed. The etamps were all in place last week. It will take some time, however, to get the water in. In the meantime sinking operations are making satisfactory headway.

CALAVERAS.

CHAMPION.—*Chronicle*, Sept. 28: The amount of water available in the West Point ditch has increased sufficiently to permit resumption of operations at the Champion mine. Stoping is being urged in all the levels, and the shaft is also heing pushed steadily down. The ore continues of excellent quality. The proprietors are building a mill, which it is expected to have in readiness to run in about four weeks. Upwarde of 800 tons of rock is already on the dumps of the mine, awaiting the completion of the mill. The upper country promises to be unusually lively, in a mining sense, this fall.

MURPHY'S.—Stockton *Independent:* Excitement is rife at Murphy's Camp over a rich strike of gold quartz on the north bank of the north fork of the Stanislaus, opposite and three or four miles distant from Murphy's. The quartz lies between the slate and the granite. Among the firet discoverers was a miner named Collier, who used to own the celebrated Collier mine at Murphy'e. He first took out two tons of rock, which was packed up the mountain on mulehack and taken to a quartz mill, yielding $500. The next lot of ten tone panned out $6,000. The ledge ie doubtless the uppermost in the county, as it joine the original granite of the mountains in which no leade exist. It may be therefore, that from this lead was washed the placer gold found on the Stanislaue below. Several locations have been made on the lead, and rich developments may be looked for soon.

COPPER. — *Calaveras Chronicle*, Sept. 28: Copper has some prospect of seeing a better day ere long. The Union company sent an expert up a short time ago to overhaul the machinery, etc., and report on same. Why these mines should remain dormant so long is truly a mystery. There are no suits pending, no indehtedness and no lack of ore. Copper is ranging at a good price at present. No company could ask for more natural advantages for mining purposes than this one has.

ITEMS.—Enormously rich rock continues to be taken from the San Joaquin mine at Mosquito, J. J. Holmes, proprietor. Heavier hoisting works are to be immediately put on the mine. Tbe 150-foot level of the Banner has been extended 80 feet, all the way in rich ore, without reaching the extremity of the pay chute. The level is still being run, with no indication of reaching the end of the rich ore. The shaft is also being sunk and is in the finest quality of rock. It is rumored that the San Joaquin hoisting works will be transferred to the Alhert mine, and new works put up on the former. A ledge over 18 inches wide and assaying ahove $100 per ton, has heen struck in the Buffalo mine near West Point. Everything prospers at the Gwin mine.

EL DORADO.

MINING INTERESTS.—S. F. *Call:* In mining there is a great deal of interest. A large number of hydraulic and placer mines are working all the time they can get water, which is scarce now. In quartz, there has been lots of prospecting, and some first-class mines are now heing opened. Near Kelsey they are opening eome good mines. One of them is a recent purohase by San Francisco men, and is one of the best, if not the best, looking and richest ledges ever found in the county. They are now erecting hoisting works, and an arastra for prospecting as they sink the shaft, which is to he sunk 100 feet and levels run each way on the ore body so as to find the extent of the ledge. The company also have a 10-stamp mill, purchased from the old Blue Lead mine. A rock soap mine is a curiosity, as the rock will clean clothes, silverware, metals, and is an excellent substitute for soap. Thero is a 6-foot ledge of it. Near Placerville tbe most of tbe mines are doing more or less work. The gravel claims are all working.

ITEMS.—*Mountain Democrat*, Sept. 28: The Esperanza mine, about one mile north of Garden Valley, has given promise of an excellent mine, so far as prospected. The ore hody is about three feet wide, and is what minére usually call "ribbon rock." The ore from top to bottom of the ehaft, whicb is about 20 feet deep, gives good results with mortar and pan. The Pocahontas mill and mine ie to commence work the 1st of Octoher, to continue during the winter. The McNaley mine is heing worked by capitalists from San Francisco. They have reached the hottom of ths old shaft and the rock is reported as looking well. A shaft at the Garden Valley mine is down 75 feet, and the lode is large, regular, and has well-defined walls. It prospects well.

MONO.

SPAULDING.—*Standard*, Sspt. 25: This mine has the sams footwall as that found in the Republic, Relief, Mono, Standard and Bodie, which are located along the hill in the order named, and carrying the same character of ore in each of them, makes it an indisputable and undeniahle fact that we havs here in Bodis district a continuous and well-defined ore channel which must extend to an indefinite depth. The veins found, varying as they do all the way from five inches to 20 feet, as found in Bodie, make it a matter of speculation, merely, when one talks of their probable size and extent. The last 20 feet sunk on the ehaft ehows a marked change for the better in the character of the ledge matter expoeed. The ledge is much better defined, with good quartz and clay, which eeems to harden and widen out as depth is attained, and from present appearances and indications, the next 50 feet will open out a body of rich ore.

CON. PACIFIC.—Engaged running tunnel which is run in 225 feet; stoping out ore ahove the tunnel and also taking out ore from the face. The ore vein is now 18 inches in width, of fine milling character. Work on Pacific No. 2 is heing done by sinking. Indications good for large hody of ore. On the second south extension of Pacific No. 1 work is being prosecuted vigorously with good results.

SOUTH STANDARD.—Engaged sinking in two places; one a double compartment shaft now down a depth of 200 feet, the other a single shaft which has attained the depth of 75 feet. The hoisting engine is working well, and everything ahout the mine is in good condition. As soon as lumber can be obtained, a building 26x48 feet will he erected over the shaft.

APOLLO AND CROSS.—This claim is situated on the west slope of Silver hill, aud is owned hy M. D. Annas, R. T. Blackwood, Robert Sourley and Henry Lent. The north line of the Apollo is 100 feet eouth of the south line of the Standard, and is west of and runs parallel with the South Burgess. The shaft is down 33 feet, and two ledges have heen found. The vein running north and soutb is about eight inches wide, and prospects well. The Cross ledge is 10 inches wide.

CONCORDIA.—Hoisting works for this mine are already on the ground, and will be in running order in 10 days. Contract for sinking 100 feet completed. Now eugaged cutting out the collar of the incline, preparatory to putting up the works.

CHIEFTAN.—From 50 level a winze ie being sunk on the vein, which showe splendidly. Some fine prospects of gold have been "borned" out from this mine, and every indication points to the near presence of a fine ore body.

ITEMS.—In the Reno an 18-inch ledge of fine looking quartz has been encountered. The May Belle shaft is heing eunk as fast as possihle. The bottom is in vein matter with good indications. The formation in the east crosscut of the White Cloud is favorahle. The Goodshaw shaft goes down eix feet per 24 honrs. It is understood that good rock is being now extracted from the mine and that a large hody of pay ore will soon he opened up. The formation of ledge in the Ajax is similar to that found in Silver Hill. The quartz containe a preponderance of silver.

NEVADA.

HUDSON MINE.—*Transcript*, Sept. 27: The mill at the Hudson mine is kept running night and day. Until Tuesday, it was being fed with rock taken from the same place in the tunnel where work was discontinued five or six years ago. For three days now ore from the surface has been put through. Altbough the rock from the tunnel was profitable, the surface yield is said to excel it in richness to a very great degree. Superintendent Murchie says that he has seldom eeen any better, and is highly elated over the prospects of the mine. Within a few days four or five extra men have been given employment, and undoubtedly the force will be again increased when developmentss have proceeded a little farther.

ITEMS.—The Boston mine, Woolsey's Flat, recently cleaned up $25,000 in gold dust from 25 days' work. The prospect shaft of the American quartz claim, on Centerville ravine, is now down 70 feet, and the ledge looking well. The water is now all out of the Knight of Malta shaft, and preparations are heing made to take out a crushing of quartz. The perpendicular shaft on the Ben Franklin claim, Oshorne hill, now down 80 feet, and in hard blasting ground, will strike the ledge in 30 feet more. The Orleans mill is kept constantly running on quartz from the Orlcans and Centennial mines. Everything is in running order again at the Murchie mine. The Independence ledge is now 15 inches thick.

SHASTA.

COPPER CITY.—Reading *Independent*, Sept. 26: The Extra Co. shipped during last week five bricks of hullion, averaging about 1,600 ounces each, which was the product of hut two pans. The new pans are in place in the company's mill, and started up on Tuesday with just douhle the amalgamating capacity they have had heretofore, and a $1,500 bar of hullion may be looked for daily hereafter. The Northern Light is heing prepared for winter so that work may progress throughout the stormy season. The new strike on Bully Hill, adjoining the Potter mins on the north, and owned hy James Sallee, is very rich. Thers are many business men coming here and anxious to huild, but cannot for want of lumhsr, and 100,000 feet of good lumber would find a market at once at a good price.

SIERRA.

SAVAGE.—*Mountain Messenger*, Sept. 28: The Savage Placer Gravel Co., havs commenced the erection of huildings for the winter, and work on the new tunnel is in rapid progress. It is estimated that 1,134 feet will have to be run to tap the line of the shaft, now down 130 feet, where it will be necessary to raise 390 feet to connect the two. 800 fcet of rim-rock is between daylight and gravel. Uppsr strata, lava, gravel cement, ahout 400 feet; then pipe clay. Hers channel has a grade of 30 feet, according to tbe survey, to the mill.

ITEMS.—It is rumored that a portion of the stockholders of the North Fork Mining Co. have purchased the interests of the Nevada county owners, and that the work of development will be proceeded with. Brueh Creek has struck rich rock iu a lower level of the mine.

TRINITY.

A GOOD SHOWING.—*Journal*, Sept. 28: From Henry Burns, Superintendent of the McGillivray D. &. H. M. C., we learn that the past year has heen a prosperous one for the corporation. The gross proceeds of the mine have been, in round numhers, $25,000, and the net profits realized foot up $12,000. When it is remenhered that these mines previously only paid running expenses, the exhihit this season must be regarded as excellent, and the credit therefor is in a great measure due to the economical and efficient management of Superintendent Burns.

TUOLUMNE.

THE HARRIS GRAVEL MINE. — *Democrat*, Sept. 28: Parties from San Francisco have spent some time this week examining the property known as the Harris gravel mine ahove Garrote. We learn they concluded the purchase on the report of the expert. This is a lafge hody of gravel which in places has yielded well. It ie the opinion of miners who have knowledge of the ground that, when properly opened, it will he a valuahle property.

SPRING GULCH MINE.—*Independent*, Sept. 28: This mine gives a hetter promise the more it is opened up. The old mill is undergoing repair. Under great disadvantages it paid hack a liberal amount of gold for the rock run through it last year. Next year it will do more and hetter work. The ore is moved on cars one mile down an incline to the mill, where water power is availahle for eeveral months.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, Oct. 2: Mr. Patton thinke the recent etrike a feeder to an ore body lying helow. From the similarity between this formation and the one in Sierra Nevada, experts pronounce it important.

CON. VIRGINIA.—Daily average yield of ore, 185 tons, which will be increased soon.

CALIFORNIA.—The north drift on the 1650 level from the Con. Virginia shaft ie heing pushed towards the Ophir line, and is now in quartz giving low assays. The nortb lateral drift from the main east drift to the C & C shaft is still in good ore. The daily average yield of ore is 200 tons, which is soon to be increased.

CALEDONIA.—The main south drift on the 1400 level is making rapid progress in a formation of promising vein matter. Tho north drift on the 1600 level is rapidly advancing in porphyry carrying streaks of lively quartz. The crosscut east on this level is also being driven rapidly on, and is enconntering material of a softer and more promising character.

SIERRA NEVADA.—The development in the incline of this mine continue to he of the greatest interest as they are of marked importance. The ore body has of late bulged into the course of the incline from the eouth and extended across the entire face. The ore encountered is very fine and richer tban that found in the crosscut run above. The 2200 level will be reached by the incline in a very few days, when the real value of the ore encountered in this part of the mine will be more definitely ascertained.

JUSTICE.—There is still ore in winze No. 2 from the 1150 level. Tbe crosscut on this level has heen driven on through the ground formerly in dispute with the Alta, and the ore body bas heen reached. Preparations are now heing made for stoping the ore for milling. The winze from the 1300 level is still cutting fine quartz carrying bunches of good ore. The crosscut on the 1400 level and from this winze is cutting favorable looking quartz. In crosscut No. 5 strong stringers of quartz show a near approach to the ledge. There has heen a marked improvement also of late in the south drift, 1300 level, the quartz assaying well especially in gold.

ALTA.—The mine is now prepared to handle all the water which is likely to he encountered, and crosscutting of the vein will be in order. The east drift on the 1550 level is very close to the vein, as is indicated hy the quartz, carrying ore, which has heen encountered. The formation cut to the north consists of quartz with ore in hunches. The drift to the eouth has been turned more towards the vein, and is also cutting quartz with spots of ore.

BULLION.—The main incline shaft below the 1840 level is making usual good progress and encountering an improved quality of quartz giving low assays. Since the dyke hss taken a more vertical pitch hetter indications of an ore hody are found.

GOULD & CURRY.—East crosscut No. 4, 1900 level, is heing pushed ahead as fast as possible, and now lacks ahout 65 feet of reaching the joint Savage winze. The face is in hard porphyry.

SOLID SILVER.—The force of men will hs increased, and as soon as water is out of the winze crosscutting the fine ore lsdge at the bottom will he commenced.

GOLDEN STANDARD.—Ground has been broken for the Golden Standard and Promontory new shaft. The site of this nsw shaft is wsll located.

SCORPION.—A division of property has been decided on, to take effect at once. The capital stock is to be increased to 100,000 shares of $100 each. The Scorpion silver mining company will retain 1,324 feet of the ground nearest the Union Con. and Sierra Nevada minee, and to which it is claimed belongs the ore body heing worked by the Sierra Nevada people. This ground will hereafter be known as the Scorpion mine, and will be divided into 100,000 shares. The balance of the property will he conveyed in equal parts (800 fect each) to four new companies for certain considerations. The names of these new incorporatione are to he the Keating, the Warsaw, the Garher, and the Thornton, each of them to consist of 100,000 shares of the par value of $100. The etockholders in the Scorpion mine (1,324 feet) will receive a dividend pro rata of the stock in tbe uew mines, each of which has 800 feet.

JULIA CON.—Nothing new to report on the 2000 level. Crosscut No. 1 has ite face etill in clay and porphyry, with some quartz coming in. The main south drift is advancing in favorable ground.

VERMONT CON.—Bottom of shaft continues in favorahle ground.

WARD.—Good advance made in the main shaft.

BELCHER.—Crosscut No. 1, opposite nortb incline is etill in a fine formation of very promising quartz and porphyry. Crosscut No. 2, 230 feet feet further eouth, is now in a fine formation of very promising quartz. The vein grows better toward the south, and the indications for an ore hody in that direction are excellent.

YELLOW JACKET.—Excellent work has been done during the past montb of Septembsr in sinking the new ehaft. In the old workings of the mine, at the 2400 level, the drift south from the winze north is in 292 feet, the face at present in bird'e-eye porphyry with occasional streake of quartz, all of which give fair assays.

UTAH.—Grading to enlarge the hoieting worke and to put in an incline engine and an extra set of boilers is being pushed rapidly forward.

UNION CON.—The east drift on the 1600 level is making good progress. The porphyry encountered is harder than formerly, but breaks well.

MEXICAN—The work of sinking tbe Mexican-Union Con. winze is making good progress.

HALE & NORCROSS.—Everything at the mine working well.

CON. DORADO.—New working shaft down about 100 feet; hottom in favorable working ledge porphyry, with streake of quartz.

SUTRO TUNNEL.—The Julia hranch ie making excellent advancement, the ground working well.

SAVAGE.—The 2100 level has so far resisted the long, strong pull of the pumps to free it from water. Still the expectation is daily to get in on that level. There is no change in the formation encountered in sinking the nortb winze on the 2000 level.

CHOLLAR COMBINATION SHAFT.—The drift on the 1593 level to connect with the Sutro Tunnel now lacks ahont 67 feet of connectiou. The rock continues hard, with occasional etreake of softer material. There ie not enough water to hinder operations.

OVERMAN.—The connection on the 1600 level is made and ventilation ie rapidly improving on that and connecting levels. It will take some daye yet to even up and smooth out the drifts ready for use.

BEST & BELCHER.—Tbe north lateral drift on the 1900 level is making about three feet per day. The face continues in hard porphyry showing etreake of etained quartz.

NORTH CON. VIRGINIA.—There is no change to note in the formations encountered.

NORTH BONANZA AND FLOWERY.—A good force of men are employed in the surface ore extraction. This ore pays well under the etamps, and is expected to defray the expensee of running the mine.

LEVIATHAN.—Face of north drift on the 750 level shows a strong vein of fine looking quartz which gives fair assays. Crosscutting will be commenced shortly.

CON. IMPERIAL.—No. 3 crosscut, on the 2400 level, shows a little improvement, more and hetter quartz coming in.

LADY BRYAN.—The 600-foot station is being opened and crosscutting at that point will soon show the true value of things. On the 350 level the north drift is running in a mixture of porphyry and low grade ore.

BENTON CON.— Crosscutting next in order.

SILVER HILL.—Crosscutting on the 800 and 900 levels is being done, increasing good prospects.

TROJAN.—The development levels of the mine are ehowing increasing good prospects as well as plenty of good ore.

SUCCOR.—On the 1040 level the face of the

northwest drift is in very promising vein matter. No bad trouble from water.

LADY WASH. CON.—The drift north from the 1250 level of the Alta will be continued on through this mine, giving a very good exploration at that depth.

CROWN POINT.—Some little improvement is met with on the 2360 level crosscutting.

ALPHA.—On the 2400 level, more quartz is coming in, with fair assays.

MORNING STAR.—The ore face in the main adit tunnel, will soon be arrived at again.

NEVADA ITEMS.—A. H. Ricketts, of Virginia City, has relocated a large ledge in the mountains to the northward of Fort Churchill, on which considerable work was done in the early days and which assays from $20 to $30 on the surface. The principal lode can be traced on the surface a distance of over 4,000 feet and which is in places of immense width. This lode has been christened the Marietta. Most encouraging reports come from the new Edison claim, Delaware district. Three or four San Francisco companies have lately purchased mines in Lake district. The Silver City, Lyon county, *Times*, reports talk of beginning work on the South Comstock, South End, Comet, Atlantic Con., Daney, Kossuth and Dayton. The Hoosac furnace will probably be started on Jackson ore. The daily output of the Hillside mine, Bristol, is about $3,000. The Falcon mine, in Rock Creek district, near Tuscarora, has been sold by the sheriff to satisfy a judgment of $248. The Paradise M. Co., recently incorporated to work the Mountain Bright mine in Mount Rose district, have listed their stock on the San Francisco Stock Board. A Frenchman, representing a wealthy organization who have a process for reducing copper ores, is looking about Nevada for favorable locations.

MONTE CHRISTO.—*Eureka Sentinel*, Sept. 27: After 10 or 12 miles of packing, 40 miles of freighting and several hundred miles of railroading, over three different roads—subject to various handlings and numerous chances for stealing—ore from the Mountain Queen, near Monte Christo, brings from $350 to $400 per ton. Mr. Spiker and another gentleman have this mine. They are down on it 150 feet, and have been drifting on the vein, which is small—varying from two to 18 inches in width. Jacobson & Corcoran are also shipping, from the same locality, nearly the same quality of ore.

ARIZONA.

BULLION SHIPMENTS.—The *Arizona Sentinel*, of Sept. 21st, publishes the following: Bullion shipments for the week ending Sept. 20th, 1878:

Sept. 14th, 2 bars Peck	$ 4,070
Sept. 15th, 5 bars Tiptop	8,097
Sept. 17th, 2 bars Peck	3,165
Sept. 17th, 1 bar B. & K	1,508
Sept. 17th, 10,928 lbs. Stonewall	90,000
Sept. 17th, 1,600 lbs. Pinal Mill	2,000
Sept. 17th, 1,500 lbs. Globe ore	3,000
Sept. 19th, 3 bars Tiptop	5,060
Total	$116,900

The shipment of 10,928 pounds of Stonewall Jackson ore is of the same rich stuff that has always attracted so much attention in San Francisco, and which has realized from $7 to $10 per pound. Our estimate of $90,000 for this lot, is probably below, rather than over, the real value. The 1,600 pounds of concentrations are from Baldwin's Pinal mill, and were made from one of the Silver King dumps; they are valued at over $1 per pound. Last week we noted shipment hence of $79,723 bullion, that figure included 25,000 pounds of Silver King concentrations, which we valued at that many dollars. Returns of sales of that lot show that it realized at the rate of $3,700 per ton, or $1.85 per pound. Therefore, we can add $21,250 more to that week's shipment, making the total for the week ending Sept. 13th, $100,973. Even then this does not include proceeds of over 2,000 pounds of Silver King "nuggets," which are melted at refinery, and from which we have heard no returns; they have usually realized $8 or $9 per pound.

COLORADO.

SILVER CREEK.—*Miner*, Sept. 21: This week there are no less than eight mines in good pay. Three weeks ago but one had any pay, and that was the Joe Reynolds; and to-day the Joe Reynolds is turning out more ore than it ever did, equally as rich as any ore heretofore taken out. The Highland Chief, leased from Gen. Gilbert by J. C. Skillman, Drake and Wheeler, the Hugo, the La Crosse, worked by Moss, Webster & Co., the Nil Desperandum and Thomas Moore are all in good pay. The Gold Belt, Terrible, Homestake and Monarch are looking well.

CLEAR CREEK.—The development of the Specie Payment mine progresses steadily with a force of about 20 men, and it is now looking better than it has for some time past. High Grade Tunnel vein carries from two to 16 inches of ore that averages about $188 per ton in gold and silver. Owens & Co., of the Victor, are taking out good ore, principally galena, but carrying large quantities of gray copper and some zinc. The Fall River mill is stamping auriferous quartz of that section with satisfaction. The Metropolitan, Seaton bill, owned by Haglund & Co., and worked by a party of Swedes, is a valuable property. The best ore carries 200 ounces in silver and four ounces of gold to the ton, and the second class about 75 ounces of silver, besides which there is some good grade concentrating ore. Galeniferous ore from the Amazon carries 200 oz. silver per ton. Mill runs on Chicago ore range from 250 to 460 ounces in silver. Albro ore yields about $100 per cord. The Old Chief has a vein in some places three feet wide.

LAKE CITY.—San Juan *Prospector*, Sept. 21: All three mills are running at their full capacity, and reducing a large amount of ore. Work is progressing finely on Lee's smelter at Capitol, and it is the intention to run this winter. Henson creek mines have shown up as well, if not better, than any mines in the San Juan, during the present season. Work has been closed for the present on the Dolly Vardeu mine. The ore was never richer than now, but the water comes in in such quantities as to make work impossible. Mr. Houghton intends to start a tunnel immediately to tap the vein at a depth of 300 feet.

GUNNISON COUNTY.—Denver *Tribune*, Sept. 25: The mines in this county are destined at an early day to be profitable to their owners and to add no little to the material prosperity of this region. They are in Washington gulch, where at placer mining the yield of gold is from $3 to $5 a day to the man—Union Park, Tin Cup gulch, and on the Elk mountain. It is said that while in the San Juan country proper (which embraces Hinsdale, Ouray, San Juan and La Plata counties) the ores are of higher grade than in this county, yet in the latter placer mining would be more lucrative than in the former, because of immense beds of excellent coal and iron ore suitable for fluxing in close proximity to the mines. Many of the mines on Elk mountain contain great quantities of ore that will mill from $75 to $100 to the ton—quite valuable because of the facilities for treating the ores. Messrs. Fluke, Sewell and others own a number of good mines there, for one of which they were offered last week $10,000 cash. Captain Hall hauled to Leadville a week or so ago a little over 1,600 pounds of carbonates from one of his mines in Union Park, and it milled over $1,000. In or near Washington gulch a smelter will be in operation in two weeks or three.

LEADVILLE.—*Eclipse*, Sept. 19: It is with no small satisfaction that we perceive the facts of the constant and rapid development of our mineral resources and the unprecedented growth of our city of Leadville. Leadville has now a daily production of 100 tons of high-grade ore milling from 70 to 400 ounces, and a capacity of from 100 to 300 tons a day of low grades, properly lead ores, not profitable to touch at present unless a need should be created for it by the smelters, which we anticipate will be the case ere long, and give a market for really valuable ore that has hitherto brought scarcely more than iron flux. From this we conclude that Leadville will ship no more lead than will necessarily be required to smelt the high grades, especially the silver-iron ores and hard carbonates, and the superabundance of good smelting ore is undoubtedly destined to make Leadville the great smelting pot of Colorado.

ITEMS.—Belcher, Iowa gulch, ore mills from $80 to $175 in silver, showing a fair percentage of lead. Placer claims in Cache creek yield rich returns in fine gold. Taber & Co., of the Winnemuck claim, paid $35,000 for a release from their hand. Two Boulder men have sold a mining interest for $10,000. Two tons of ore from the Last Chance, Camp Providence, assayed $650 per ton. The Atchison, Topeka & Santa Fe railroad is completed to Trinidad, 15 miles north of the New Mexican line.

BULLION SHIPMENTS.—Standard, Sept. 23d, $16,482.90; Northern Belle, Sept. 23d, $4,135.10; Leopard, Sept. 26th, $8,200; Hussey, Sept. 26th, $4,500.50; Hampton, Bingham, Sept. 24th, $3,000; Bodie, Sept. 26th, $14,000; total to date, $176,000; Sept. 29th, $12,200; Sept. 30th, $8,400; Silver Reef, $13,685.10; Germania, $4,000; $2,900; Butte, $7,481.51; Ontario, $6,254.44; $5,332.50; $2,746.62; $3,387.12; Tybo Con., Sept. 25th, $3,973.78; total for Sept. to date, $49,193.29; Endowment, Oct. 1st., $2,844.78; total to date, $30,120.70; Independence, Sept. 30th, $7,000; California, Sept. 28th, $82,268.30; total to date, $231,083.21; Con. Virginia, Sept. 28th, $66,947.56; total to date, $173,201.90; Indian Queen, Sept. 23d, $5,218.96; Cortez, Sept. 29th, $6,147.45; Manhattan, Sept. 28th, $11,800; Sept. 30th, $11,500; Christy, Oct. 2d, $6,903; Tybo Con., Sept. 27th, $7,594.30; Bodie, Sept. 23d, $9,972.13; Standard, Sept. 30th, $20,062.65; Northern Belle, Sept. 28th, $5,317.83.

MINING IN NEW SOUTH WALES.—The *Alta* comments on the following from official publications of this colony: The alluvial, or placer, mining in 1877 was nearly all done by deep drifting, hydraulic work on a scale common in California being unknown. Only 1,000,000 tons of auriferous gravel were washed, or less than each of two score of claims sends through its sluices in the Sierra Nevada. The average yield of this Australian placer ground is $1.50 a ton, while here the average yield in the placers does not exceed 40 cents a ton. The average yield of the auriferous quartz is $13 per ton. The gold miners number 7,000, of whom 1,500 are Chinese, and the average yield for each per working day in the year was about $1.15. In California the yield for each miner is not less than $4 per day, that is, of those engaged in paying claims. Coal is the most valuable mineral, the annual product amounting to $4,000,000, while that of tin was $2,500,000, that of copper $800,000, and of petroleum $1,300,000.

THE latest published statements of the number of adult males, employed in various occupations in the United States, put the miners at 153,106.

News in Brief.

COTOPAXI is in violent eruption.

UTAH'S grape crop is better than usual.

THE Odd Fellows' bank of Sacramento has suspended.

ENGLAND is getting up a war with little Afghanistan.

ANOTHER mill for crushing sugar-cane has gone to Salt River, Arizona.

GENERAL Sherman collected over 200 pounds of rich ore from the Prescott country.

BOSTON parties are developing a silver mine on farm land in Sussex county, N. J.

A 22-pound nugget of copper has been taken from a mine in Pennsylvania.

THE total number of yellow fever cases to Sept. 25th, 15,429; deaths, 6,751.

GENERAL HALBERT E. PAINE, of Wisconsin, has been appointed Commissioner of Patents.

THE volume of the Amazon is estimated at 7,000,000 cubic feet a second.

TURKEY may have to pay Russia a war indemnity of 310,500,000 francs.

THE Arizona bullion product this year will be in the neighborhood of $8,000,000.

BY recent surveys the Madeira river, in Brazil, is found to be navigable for 500 miles.

THE Tropic mine, near Idaho Springs, Colorado has been sold to Chicago men for $50,000.

FRENCH subscriptions to the yellow fever sufferers in the United States amount to $12,000.

THE British government has ordered the emancipation of all slaves on the island of Cyprus.

AN earthquake at Montefalco, in a province of Umbria, Italy, has rendered 143 houses uninhabitable.

LARGE deposits of fine marble have been discovered near Ishpeming, Lake Superior district, Michigan.

THE Mosquito Gulch ledge at Cariboo, shows rock that assays $720 to the ton, at a depth of 20 feet.

TRAINS on the Union Pacific run slowly at night for fear of displaced rails. Train robbers are still feared.

GENERAL SHERMAN says that he does not see how Prescott, Arizona, can get along without a woolen mill.

ON Sept. 29th, $50,000 worth of Silver King concentratione was forwarded from Yuma to San Francisco.

SINCE 1865 the spinning power of the world has increased from 2,000,000 to 3,000,000 pounds per year.

THERE seems to be an impression that life insurance in this country may be called upon to pay its own policy.

AN Indian soapstone quarry of considerable size has been discovered on Rock creek, just outside of Washington.

THE National banks charged off during the six months ending March 1st, 1878, losses amounting to $10,903,145.

FIVE hundred Russian officers, including 40 colonels, are accused with misappropriation of money during the late war.

THE excess of exports over imports indicates an increasing flow of specie and of American securities toward this country.

THE center of Ryer's island, in the Sacramento, is covered with debris to the depth of 18 inches by last spring's floods.

THE beach gold excitement has spread to Half Moon Bay and at least 12,000 feet of diggings have been taken up there.

THE net profits of the Western Union Telegraph Co., for the quarter ending September 30th, are estimated at over $1,000,000.

ONE of Custer'e men, who helped to bury him, positively denies the story that the remains interred at West Point are not Custer's.

SOME Italian ranchere while grading a road north of the Wells Fargo mine, struck a quartz vein assaying between $300 and $400 per ton.

CURTNER'S warehouse, at Warm Springs station, Alameda county, supposed to contain from 6,000 to 10,000 sacks of grain, was burned on September 25th.

THE Richmond M. Co., smelting works burned to the ground September 27th. The bin with 175,000 bushels of coal was destroyed. Total loss, about $85,000.

THIRTEEN years ago the United States debt was $7,825 per capita; to-day it is $4,157 per capita. Thirteen years ago, the interest was $429 per capita; now it is $197 per capita.

A SINGLE locomotive building establishment in this country will have constructed in 1878 no less than 300 locomotives, against 185 in 1877. Railway building is on the increase.

THE proposals of the committee for acquiring and completing the Oregon Central railroad have been approved by bondholders representing $2,811,100, in meeting at Frankfort-on-the Main.

THE wool clip of Oregon this year is about 6,580,000 pounds, being 1,500,000 pounds more than last year. The prices range from 13 cents for the poorest to 25 cents for the best quality.

PETROLEUM CENTER, Pa., once a town of nearly 4,000 inhabitants is now a deserted village of about 100 people. The oil wells are empty.

ELLIS SPEAR has tendered his resignation as Commissioner of Patents, to take effect October 31st. It is understood the position has been offered to Ex-Congressman Halbert E. Paine of Wisconsin, but he has not accepted.

HORSES, mules, cows and oxen, and all agricultural machinery and implements, may be imported duty free for one year into the provinces of Puerto Principe and Santiago de Cuba. The term may be extended another year.

New Incorporations.

The following companies have filed certificates of incorporation:

RENO, M. Co.—Mono Co. Directors—J. H. O'Brien, Daniel Brolley, Henry Phillips, J. T. McGeoghegau and Thos. Dovine. Capital, $6,500,000. Nevada M. Co., Mono Co., same Directors as Reno company.

NORTH KEYSTONE M. Co.—Storey Co., Nev. Directors—W. H. Sharp, Geo. Congdon, G. W. Osborn, Samuel Poorman and Chas. J. Collins. Capital, $10,000,000.

NEVADA CITY, G. M. Co.—Capital, $3,000,000. Directors—M. J. Shoecraft, J. M. Sprague, W. E. Mayhew, E. E. Smith, O. H. Lewis.

MARYLAND M. Co.—Bodie district. Capital, $6,000,000. Directors—G. E. H. Howard, E. C. Locke, J. N. Risdon, L. W. Mix, Otto Metchke.

ALTA M. Co.—Bodie district. Capital, $600,000. Directors—Same as preceding company.

SUPERIOR M. Co.—Capital, $10,200,000. Directors—E. R. Smith, N. Kimball, J. E. Mitchell, J. Poheim, J. Gibson.

INDICATOR M. Co.—Capital, $5,000,000. Directors—J. M. Johnson, J. A. Rice, J. Newlands, S. A. Chapin, J. A. Rohinson.

LORD AND ROBINSON S. M. Co.—Capital, $5,000,000. Directors—E. K. Shercnot, J. C. DeVoy, J. F. Davis, E. G. Frieland, C. E. Brinsmade.

PEMBERTON M. Co.—Capital, $600,000. Directors—B. T. Lacey, A. C. Hiester, E. P. Solomon, J. D. Gray, J. L. King.

AMADOR GRAVEL M. Co.—Amador Co. Capital, $1,000,000. Directors—Morris Speyer, W. B. Cummings, J. S. Van Winkle, W. H. Taylor and Samuel Hubbard.

MARIETTA M. Co., to prospect a ledge north of Fort Churchill, Nev. Directors—George A. King, Richard Rising, E. J. Pasmore, R. H. Lindsay and D. E. McCarthy. Capital, $10,000,000.

SILVER JACKET M. Co.—Gold Hill District. Capital, $10,000,000. Directors—J. D. Thompson, John Burns, Geo. S. Carrier C. W. Ham, L. W. Boyer and D. J. Mauning.

SANTA MINA G. M. Co.—Bodie district. Capital, $6,000,000 in 60,000 shares. Trustees—John Neale, F. Horner, G. B. Hibbard, J. H. Ferrall, J. H. Fish.

FAIRMOUNT M. and M. Co., to operate in Winnemucca district. Capital, $5,000,000 in 50,000 shares. Trustees—G. W. Terrill, I. C. Bateman, O. Merrill, H. H. Pierson and John Howell.

STANLEY M. Co.—Nev. Capital, $10,000,000. Directors—Robert Barton, J. J. Ayers, A. H. Rutherford, Charles H. Aitken and George Turner.

FLAGSTAFF M. Co.—Maynard district, Mohave Co., Arizona. Capital, $10,000,000. Directors—J. J. Ayers, C. M. Burleson, J. H. Backus, B. W. Reagan and J. F. Place.

LOLA M. Co.—Maricopa Co., Arizona. Capital, $10,000,000. Directors—L. L. Robinson, Robert Sherwood, Clinton Gurney, Alexander Forbes and John W. Gasbwiler.

NORTH GOULD & CURRY G. AND S. M. Co.—Storey Co., Nev. Capital, $10,000,000. Directors—M. Oppenheimer, Robt. Sherwood, J. M. Goewey, B. F. Dahl and C. H. Livingstone.

EMPIRE CON. M. AND M. Co.—California and elsewhere. Capital, $4,000,000. Directors—J. B. Fargo, W. L. Parkhurst, F. G. Smitb, D. L. Parkhurst and Delos Lake.

ROUGH AND READY CON. M. Co.—Mono Co. Capital, $10,000,000. Directors—John Tague, H. Mayers, E. E. McCammon, J. C. Chalmers and A. H. Rutherford.

GARBER M. Co.—Nev. Capital, $10,000,000. Directors—Robt. Sherwood, O. F. Giffin, C. F. MacDermott, J. P. Jackson and H. F. Cutter.

THORNTON M. Co.—Same place, same Directors and capital.

KEATING M. Co.—Same location, Directors and capital.

WARSAW M. Co.—Same place, capital and Directors, save that E. R. Warsaw is substituted for H. F. Cutter.

JOSEPH Clark informs the San Bernardino *Times* that he has struck a ledge of silver-bearing ore in the Arroyo San Antonio, eighteen miles from Pomona, which is eight feet in width, and assays away up in the hundreds.

THE amount of U. S. currency outstanding Sept. 30th was $363,402,220.

FROM January 1st, to August 1st, 900 miles of railroad was completed in the United States.

The Atlantic and Pacific Forests.—No. 5.

[By Prof. Asa Gray.]

The difference in the composition of the Atlantic and Pacific forests is not less marked than that of the climate and geographical configuration to which the two are respectively adapted.

With some very notable exceptions, the forests of the whole northern hemisphere in the temperate zone (those that we are concerned with) are mainly made up of the same or similar kinds. Not of the same species; for rarely do identical trees occur in any two or more widely separated regions. But all round the world in our zone, the woods contain pines and firs and larches, cypresses and junipers, oaks and hirches, willows and poplars, maples and ashes and the like. Yet with all these family likenesses throughout, each region has some peculiar features, some trees hy which the country may at once he distinguished.

Beginning hy a comparison of our Pacific with our Atlantic forest, I need not take the time to enumerate the trees of the latter, as we all may be supposed to know them, and many of the genera will have to be mentioned in drawing the contrast to which I invite your attention. In this you will he impressed most of all, I think, with the fact that the greater part of our familiar trees are "conspicuous hy their absence" from the Pacific forest.

For example, it has no magnolias, no tulip tree, no papaw, no linden or hasswood, and is very poor in maples; no locust trees—neither flowering locust nor honey locust—nor any leguminous tree; no cherry large enough for a timher tree, like our wild hlack cherry; no gum trees (Nyssa nor Liquidamhar), nor sorrel tree, nor kalmia; no persimmon, or humelia; not a holly; only one ash that may he called a timber tree; no catalpa, or sassafras; not a single elm, nor hackherry; not a mulherry, nor planer tree, nor maclura; not a hickory, nor a heech, not a true chestnut, nor a hornheam; harely one hirch tree, and that only far north, where the differences are less striking. But as to coniferous trees, the only missing type is our hald cypress, the so-called cypress of our Southern swamps, and that deficiency is made up hy other things. But as to ordinary trees, if you ask what takes the place in Oregon and California of all these missing kinds, which are familiar on our side of the continent, I must answer, nothing, or nearly nothing. There is the madrona (arhutus) instead of our kalmia (hoth really trees in some places); and there is the California laurel instead of our Southern red hay tree. Nor in any of the genera common to the two does the Pacific forest equal the Atlantic in species. It has not half as many maples, nor ashes, nor poplars, nor walnuts, nor birches, and those it has are of smaller size and inferior quality; it has not half as many oaks; and these and the ashes are of so inferior economical value, that (as we are told) a passahle wagon wheel cannot he made of California wood, nor a really good one in Oregon.

This poverty of the Western forest in species and types may he exhibited graphically, in a way which cannot fail to strike the eye more impressively than when we say that, whereas the Atlantic forest is composed of 66 genera and 155 species, the Pacific forest has only 31 genera and 78 species.* In the appended diagrams, the short side of the rectangle is proportional to the numher of genera, the long side to the numher of species.

Now the geographical areas of the two forests are not very different. From the Gulf of Mexico to the Gulf of St. Lawrence ahout 20° of latitude intervene. From the southern end of California to the peninsula of Alaska there are 28°, and the forest on the coast runs some degrees north of this; the length may therefore make up for the comparative narrowness of the Pacific forest region. How can so meager a forest make so imposing a show? Surely not by the great numher and size of its individuals, so far as deciduous (or more correctly non-coniferous) trees are concerned; for on the whole they are inferior to their Eastern hrethren in size if not in numher of individuals. The reason is, that a larger proportion of the genera and species are coniferous trees; and these, being evergreen (except the larches), of aspiring port and eminently gregarious hahit, usually dominate where they occur. While the East has almost three times as many genera, and four times as many species of non-coniferous trees as the West, it has slightly fewer genera and almost one-half fewer species of coniferous trees than the West. That is, the Atlantic coniferous forest is represented by 11 genera and 25 species; the Pacific hy 12 genera and 44 species. This relative preponderance may also he expressed hy the diagrams, in which the smaller enclosed rectangles, drawn on the same scale, represent the coniferous portions of these forests.

Indeed, the Pacific forest is made up of conifers, with non-coniferous trees as occasional undergrowth or as scattered individuals, and conspicuous only in valleys or in the sparse tree-growth of plains, on which the oaks at most reproduce the features of the "oak openings" here and there hordering the Mississippi prairie region. Perhaps the most striking contrast hetween the West and the East, along the latitude usually traversed, is that hetween the spiry evergreens which the traveler leaves when he quits California, and the familiar woods of various-hued round-headed trees which give him the feeling of home when he reaches the Mississippi. The Atlantic forest is particularly rich in these, and is not meager in coniferous trees. All the glory of the Pacific forest is in its coniferous trees; its desperate poverty in other trees appears in the annexed diagram.

The diagrams on this page are made more instructive, and the relative richness of the forests round the world in our latitude is most simply exhihited, hy adding two or three similar ones. Two will serve, one for Europe, the other for Northeastern Asia. A third would he the Himalay-Altaian regiou, geographically intermediate hetween the other two as the Arizona-Rocky mountain district is hetween our Eastern and Western. Both are here left out of view, partly for the same, partly for special reasons pertaining to each, which I must not stop to explain. These four marked specimens will simply and clearly exhihit the general facts.

Keeping as nearly as possihle to the same scale, we may count the indigenous forest trees of all Europe at 33 genera and 85 species. And those of the Japan-Manchurian region, of very much smaller geographical area, at 66 genera and 168 species. I here include in it only Japan, Eastern Manchuria, and the adjacent horders of China. The known species of trees must be rather roughly determined; hut the numhers here given are not exaggerated, and are much more likely to he sensibly increased hy further knowledge than are those of any of the other regions. Propcrly to estimate the surpassing richness of this Japan-Manchurian forest, the comparative smallness of geographical area must come in as an important consideration.

To complete the view, let it be noted that the division of these forests into coniferous and non-coniferous is, for the

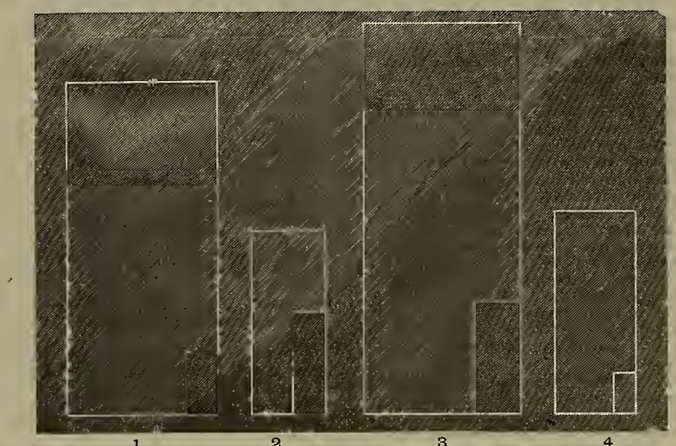
European non-coniferous	26 genera,	68 species.
" coniferous	7 "	17 "
	33 "	85 "
Japan-Manchurian non-coniferous	47 genera,	123 species.
" " coniferous	19 "	45 "
	66 "	168 "

In other words, a narrow region in Eastern Asia contains twice as many genera and ahout twice as many species of indigenous trees as are possessed hy all Europe; and as to coniferous trees, the former has more genera than the latter has species, and over twice and a half as many species.

The only question ahout the relation of these four forest regions, as to their component species, which we can here pause to answer, is to what extent they contain trees of identical species. If we took the shrubs, there would he a small numher, if the herbs a very considerable number, of species common to the two new world and to the two old world areas respectively, at least to their northern portions, even after excluding arctic-alpine plants. The same may he said, in its degree, of the North European flora compared with the Atlantic North American, of the Northeast Asiatic compared with the northern part of the Pacific North American, and also in a peculiar way (which I have formerly pointed out and shall have soon to mention) of the Northeastern Asiatic flora in its relations to the Atlantic North American. But as to the forest trees, there is very little community of species. Yet this is not ahsolutely wanting. The red cedar (*Juniperus Virginiana*) among coniferous trees, and *Populus tremuloides* among the deciduous, extend across the American continent specifically unchanged, though hardly developed as forest trees on the Pacific side. There are prohably, hut not certainly, one or two instances on the northern verge of these two forests. There are as many in which Eastern and Western species are suggestively similar. The hemlock-spruce of the Northern Atlantic States, aud the yew of Florida are extremely like corresponding trees of the Pacific forest; indeed the yew trees of all four regions may come to he regarded as forms of one polymorphous species. The white hirch of Europe and that of Canada and New England are in similar case; and so is common chestnut (in America confined to the Atlantic States), which on the other side of the world is also represeuted in Japan. A link in the other direction is seen in one spruce tree (called in Oregon Menzies spruce) which inhahits Northeast Asia, while a peculiar form of it represents the species in the Rocky mountains.

[To be Continued.]

*We take in only timber trees, or such as attain in the most favorable localities to a size which gives them a clear title to the arboreous rank. The sub-tropical southern extremity and Keys of Florida are excluded. So also are one or two trees of the Arizonian region which may touch the evanescent southern borders of the Californian forest. In counting the coniferous genera, pinus, larix, picea, abies and tsuga are admitted to this rank, but cupressus and chamæcyparis are taken as one genus.



1. European Forest. 2. Japan-Manchurian Forest. 3. Pacific Americau Forest. 4. Atlantic American Forest.

MANIFESTATIONS OF GLANDERS IN DIFFERENT STAGES.

FIG. 5.

EXAMINING THE NOSTRILS.

The Detection of the Glanders.

Editors Press:—Will you please describe in the next issue of your valuable paper the symptoms of the horse disease called glanders, in its incipiency and later stages?—A. L. S., Borden, Fresno Co., Cal.

We comply with this request at once, because no subject is at present more engaging the attention of horse owners. Just what state of distribution the disease is in either in city or country, we do not know, hut the reports of cases in this city and the cases in Santa Clara and Merced counties, where the disease has been communicated from horses to men, makes the detection of the disease in all its stages a matter of much public importance. Therefore we shall introduce both description and illustration that the subject shall he clearly intelligible, and in doing so shall draw upon an able work, "The Illustrated Horse Doctor," written hy Edward Mayhew, an eminent veterinary writer and member of the Royal College of Veterinary Surgeons of England. He, in common with other recognized writers, takes the ground that there is no cure for glanders because it is an ulcerative disorder which hastily disorganizes the parts which it attacks. The fact that so many cures for glanders are put forth by practical men who have had success with them may he owing to the fact that they had treated diseases which had some of the marks of glanders, hut not the disease in its aggravated form. When the disease is established heyond question by the marks which we will describe, the least should he killed, and all other animals removed from chance of contact with places he has frequented.

In the early stage it is difficult to pronounce positively upon a case of glanders. Ulceration of the nasal membrane would he confirmation of the worst douht; hut the ulceration may he situated so high up as to defy all our efforts to distinguish it. Yet running from the nose may be perceptible and the glaud may be fixed to the jaw. Both of these symptoms, although lawfully provoking our fears, are frequently attendant upon aggravated or upon prolonged colds. The only lawful test iu such cases is the administration of three doses of solution of aloes, eight ounces to the dose, allowing three days to elapse hetween each. If the horse be glandered, hefore the last purgative has set, the real nature of the malady will be apparent in the aggravation of the symptoms. If glanders he not present, a little careful nursing will generally remove all effect of the medicine.

The glanders is mostly ushered in by fehrile disturhance. The appetite is had, the coat stares and the pulse is quickened. A mash or two, however, apparently sets all right and the matter is forgotten. Soon afterward a slight discharge may issue from one nostril; but it is so very slight it excites no alarm. (See Fig. 1.) One of the lymphatic glands, on the same side as the moist nostril, alters in character. It may remain loose and hecome morhidly sensitive. Usually, however, it grows adherent to the jaw, turns hard, insensitive, and, from heing wholly imperceptihle in the healthy animal, enlarges to about the size of half a chestnut.

At a latter period, the discharge, retaining its clear appearance, hecomes more consistent, and, to a slight degree, the hairs and parts over which it flows are incrusted. It suhsequently adheres to the margin of the nostril, and then in the transparent, alhuminous fluid may he seen opaque threads of white mucus. This marks the second stage. (Sec Fig. 2.)

The next change takes place more rapidly. The transparent fluid entirely disappears and in its place is seen a full stream of unwholesome pus. (See Fig. 3.) At this time there is some danger of glanders being mistaken for nasal gleet. A little attention will, bowever, rescue any person from so imminent a peril. The smell of glanders is peculiar. It is less pungent, but more unwholesome, suggesting a more deep-seated source than characterizes the disease with which it has been confounded. The ejection of glanders, moreover, is ohviously impure, whereas that of nasal gleet generally flows forth in a fetid stream of thick and creamy matter.

When the third stage is witnessed, the disease is rapidly hurrying to its termination. The membrane of the nose changes to a dull, leaden color. The margins of the nostrils become dropsical and every hreath is drawn with difficulty. The defluction exhibits discoloration. Scahs, masses of hone or pieces of membrane, mingled with patches of hlood, next make their appearance, and the internal parts are evidently heing hroken up by the violence of the disorder. (See Fig. 4.)

The reader has been told what constitutes glanders. He has heen instructed how to recognize its more marked indications. There, however, remains to teach him the manner in which a suspected horse should he handled or examined. The animal's head should be turned toward the strongest light ohtainahle; if toward the hlaze of the noonday sun, so much the hetter. The examiner should then place himself hy the side of the creature's head, not in front, hut in a situation where, though the animal should snort, he is in no danger of the ejected matter falling upon him. With one hand tbe upper and outer rim of the nostril should he raised; when, grasping this part hetween the finger and thumh, no fear need he entertained. The case would be something

Seventeen Pacific coast gold mines yielded during August, $1,069,839; 16 silver mines, $638,633; three gold and silver mines gave $530,971; three hase metal mines, $428,008.

more than suspicious, wers any risk of contamination incurred. (See Fig. 5.)

The wing of ths nostril being raised, the examinsr must note the appearances exposed; this hs will best do hy knowing where to look and what to expect. His eye has nothing to do with the skin nor with the marks that appear upon it. The opening of the lachryinal duct (marked 1) often challenges observation by being well defined and particularly conspicuous; but that natural developemant does uot concern him; to that no atteution must hs giveu. The inspection must be concentrated upou the membrane (marked 2) mors intcrually situated than the skin seen at the commoncement of the nostrils. The skin, morcover, suddenly ceases, and is obviously defined hy a well-marked margin; there is, therefore, no difficulty in distinguishing the membrane by its fleshy and moistened aspect, as well as hy its situation. If, on this membrane, auy irregular or ragged patches ars conspicuous, if theso patches are darker toward their edges than in their centers, and if they, nevertheless, seem shallow, pallid, moist, and sore, the animal may be rejected as glandered. Should any part of tho membrane (after being wiped with a littls tow or wool fastened to a stick) seem rough or have evidently heneath its surface certain round or oval-shaped hodies, ths horse assuredly is glandered. Ths membrane may present a worm-eaten appearance, or be simply of a discolored and heavy hue. In the first case, the animal ought to ho condemned; in the secoud, it is opsned to more than suspicion.

No animal should he permitted to slowly perish of glanders. The disease, as it proceeds, affects the fauces, pharynx, and laryux; all bscomes ulcerated. Not a particle of food can he swallowed; not a drop of saliva can he deglutated; not a breath of air can he inspired, without the severest tortnre being experienced. As the disease proceeds, the ohstructiou offered to the hreathing grows more and more painful. Farcy hreaks forth, and, as a consequence, superficial dropsy is added to the other torments. Tho edges of the uostrils enlarge; the mombrane lining the cavities bags out, while the fauces and larynx contract; the discharge becomes more copious and the hreathing is impeded. Thus the difficulty of respiration is increased, just as ths condition of the lungs renders the necessity of pure air the more imperative. Ultimately, however, laborious breathing induces congestion of the hrain, and the wretched snfferer falls insensihle, it is hoped, to die of actual snffocation.

Jackson's Steam Well-Borer.

Mr. H. E. Hallett furnishes the following interesting description to the *Pacific Rural Press*, of Mr. Jackson's artesian well-horer, which bas recently heen in snccessful operation in Stockton:

This machine can be worked by steam, horse or man power. When run by an engine, 40 pounds of steam is nsed. Unlike ths "hydraulic well-borer," the earth is hoistcd to ths top of the well at every successive dspth of ons foot or 20 inches, depending on the nature of the soil. The auger is worked by hevel gearing on a dsrrick 30 feet in hight, whose base is an ohlong 15 feet in length by five feet in width. At one side is a table or platform. The shaft is made of heavy hydraulic tubing with inside couplings and runs through a hollow screw. A pinion on the right drives the shaft forward, while anothsr on the lsft revsrses the shaft.

Gearing underneath the platform is devised to hoist and lower the shaft without rsvolving the shaft. Underneath the platform is also a spool on which a wire cable is wound, on one end of which are nippers.

The auger is peculiar. There is one auger with three bits on the point of the shaft. The auger doing most of the work is on a hollow tuhing about 10 feet in length and fitting the shaft. At ths bottom of the tuhing is a ratchet nearly the same as the ratchet on the hayonet of a gun, and when the tubing is dropped from the mouth of the well, it takes its plac and is secured by the forward or drive motion of the shaft; reversing the shaft releases the tuhs.

A hollow, cylindrical compartment or large tube, holding one foot to twenty inches of soil is fastened to the tubing encircling ths shaft. A sand augsr in the form of a plats with short bits is at the bottom of this case, and fastened to the tuhs with a valve closing with a reverse motion of the shaft. Below the short compartment or cass is a bit on one side and a reamer on the other, hoth fastened to ths tube and held in place by a shoulder and a pin. The hit cuts the bors of the well after the small three-hitted auger on ths point of the shaft, and the reamer cuts a little larger for the case. Ahove ths short case are two reamers fastened to the tuhing on opposite sides, cutting the hore to the right diameter for the permanent casing. The earth cut hslow the short case is forced up into the cass and held by its compactness. Reverse the motion of the shaft and the tubing is released, the bit and reamers clossd, and the whole drawn up the surface and the case of earth emptied. The time occupied in ascending 270 fest was two minutes. The time occupied in descending the same depth (the tuhing is dropped) is hut 34 seconds, the whols operation bsing performed in two minutes and 34 seconds. It is claimed tbat 100 feet per day can be sasily bored witb this machine.

Useful Information.

On the Manufacture of Wood Gas.

A foreign exchange gives the following method of the manufacture of oxy-carbon gas, which may be of interest to soms of our experimentors: As soon as the retorts ars at a red heat, carbonates and woody substances are introduced into them. The latter at once ignite, the carhonates decomposing at a higher temperature, and the carbonic acid in the presence of the vapor of water which arises either from the moisture of the substances themselves, or is introduced for the purpose, is disengaged from the carbonates passing through the glowing embers and produces oxide of carbon by the following reaction:—$co^2 + c = 2\,co$; the mingled gases form ono of a much greater bulk and of a much greater heating power than would be derived from the wood alone. One kilogramme of wood gives 300 liters (10.56 cubic feet) of gas, and one kilogramme of carbonates, 500 liters (17.65 cubic fest), or a total for the two of 800 liters (28.21 cubic feet), of a gas having a very great heatiug power. In 100 parts 79 are oxide of carbon, nine hydrogen and eight proto-carhonated hydrogen (thess three gases giving ths maximum temperature which can bs got with large flamss); besides these, there ars 3.5 parts of carbonic acid and 0.5 parts nitrogen, but ths proportion of these inert gases is so small that they do not detract from the qualities of the gas. The gas on leaving the retorts is cooled hy ths ordinary methods, and is thus caused to deposit its tar and the pyroligneous liquids, and is then takeu direct to the gas-holders for use. Directly gas ceases to he giveu off, the charge is withdrawn, and a second one is introduced. Ths use of water to assist decomposition depends on ths condition of the materials employed. This gas can be used whether purified or not, in closed or open chambers, with or without ths aid of air or steam, and under any pressure, and for every manufacturing and domestic purpose, whether for heat or lighting. It is claimed that it can effect these objects at a saving of from 33⅓ to 80% for heating, and from 10⅞ to 25% for lightiug, over any other means at preseut known. It professes to effect this saving partly from avoiding the loss of heat ensuing on the combustion of solids, and partly from ths value of the products remaining after the manufacture of the gas, sucb as charcoal, tar, lime, etc. It is stated that 1,000 kilogrammes of wood (about one ton), and 1,000 of carbonates produce 800 cubic meters (28,254 cubic feet) of gas, weighing at the rate of 820 grammes to the cubic meter, 761 kilogrammes equivalent in heating power to 3,200 kilogrammes of average coal.

Valuable Products from Refuse Axle Grease

The economy of the French is illustrated by an exhibit at the Paris exposition by an sxtensive chemical establishment employed in extracting valuahle products from refuse axle grease. The French railroads generally make their own luhricators: the constitutents being 50% fatty matter, as tallow, palm, olive, arachide, or colza oils, 50% slightly alkaline water (say, 3° to 4° B.) caustic, soda, or carhonate of potash. After a certain time, depending on various circumstances and the exigencies of service, the residues from the boxes are removed, the hoxes cleaned, and the old grease disposed of to make the products exposed. The special treatment is the employment of steam, hoiling in kettles holding 3 tons each; giving fat acids (or acid fats) of straw color, easily saponifiable and well defined hy their melting points. The determination of this melting point is very important, hecause these fatty acids, free from glycerine, find their principal applications in the manufacture of stearic acid hy distillation; it is determined hy the ingenious method devised hy Dalican. These acid fats are also successfully employed in making soft soaps, and hard marhled soaps. After the separation of the fatty acids there are ohtained as secondary material, metallic sub-soaps, which, treated witb soda in iron boilers, give hard soaps, known as bronze soap. The residucs of this saponification are treated with sulphuric acid and give mixed sulphates of copper and iron, which, according to the state of the trade, and their richness in copper, ars either sold under that form, or treated for the extraction of the copper they contain. In this latter case they are treated in retorts under pressure, like the scoria of relining of Corocoro and Chile. The ohtaining of metallic coppsr is a comparatively easy operation. Several samples of copper huttons are exhihited. During the last three years this establishment has snt out 120,000 kilos. of these residues.

Experiment with Lithofracteur.—The following is a record of an experiment with ths newly introduced explosive lithofracteur in an English mius. The 180 fathom level was selected, and a hole was hored in the face of the end 6 ft. deep, slightly dipping, with 1½ in. borer, and into this was placed three charges of lithofraoteur, the first charge containing ½ lb., the second 1½ lb., and the third 2 lbs. These charges were fired separately, which burnt the bottom of the hole large enough to contain the quantity necessary for blasting a hole of such a depth, and the hole was then charged, in ths ordinary manner, with 21 lbs. of lithofracteur, and blasted, The face of tbe end was blown completely out for 7 ft. wide and 7 ft. high, gradually declining to 1 ft. at the farthest or inuermost point. The rock was brought out from 1 ft. deeper than the hole was hored, and the ground was shattered for 2 ft. further in. The charge altogether took about 25 lbs. of lithofracteur, and the hole was hored in an end that cost $100 per fathom for driviug.

Trade in the Yellow Fever Districts.—Notwithstanding the fierce epidemic which prevails at New Orleans, the daily journals of that city published, on the 1st iust., their customary annual review of ths trade and commerce of the port, which thsy assert has increased during the year, and is eveu now more active than the yellow fever reports would lead people to suppose at the North. There was an iucrease of 192,667 bales in the receipts of cotton over 1876-77, in sugar a decline of 38,738 hogsheads, in molasscs an increase of 41,348 barrels, but the leading feature of ths year was the progressive movement in corn and wheat, ths former showing au increase of 3,250,000 bushels, and the latter of 938,296 sacks in the receipts. Upon this showing the New Orleans papers found a hops of still larger gains in the movement of western graiu down the Mississippi, quickened as it is likely to bc hy the steady improvement of ths port, as the Eads jettics approach completion.

Good Health.

The Shape of the Shoe.

Editors Press:—Is thcre in San Francisco, or in the civilized world, a shoemaker who can and will maks a proper covering for a human foot?

Ths shape of our boots aud shoes are a foul blot upon our hoasted enlightenment. Why, a shoemaker's last bears about as much rsemblance to a natural foot as it does to a man's nose

Corns and hunions, and overlapping toes, which ought to be absolutely unknowu, are the rule among tbe grsat mass of white people, and of all the thousands of feet to he seen iu the streets of a city, scarcely one pair in a thousand are of the natural form, and that pair is the property of some barefooted hoodlum!

Have we not borne the tyranny of ths shoemaker long enough? Or is it the fault of fasbion alone? In any case, let some one in the land of freedom come forward with moral courage enough to make shoes of the absolute shape of his customers' feet, which for the very young, at least, would be a natural shape. Let the foot hs clasped as tightly as comfort will allow hehind the toes, but let the toes spread as God intended them to do. Above all, aholish the absurd practice of chamfering off the sole from tbe hall of the great toe, so as to compel that important part of the locomotive apparatus to take an unnatural position with reference to the axis of the foot, to the destruction of all grace and power in running or walking. The law of Nature is that a straight line drawn from the point of the great toe, through the centre of the hall thereof, shall, if continued hackward, pass exactly through the middle of the heel. Now, I will venture to say that there is not a pair of hoots or shoes to he found in San Francisco that will conform to this law, for if a straight edge be laid upon the sole, at the distance of half the breadth of ths great toe from the edge, aud parallel to tbat edge, it will invariably be found to pass, not as it should through the middle of the heel, but an inch or two inside of it.

This is the land of innovation and experiment. Will not some intelligent and spirited shoemaker try the experiment of making footcoverings to fit the feet, inwardly at least, and if fashion must he howed to, let the outside be adapted to its absurd requirements.

C. H. A.

San Francisco, September, 1878.

Neuralgia and Rheumatism.—A correspondent of the *Germantown Telegraph* says: A very simple relief for neuralgia is to boil a small handful of lobelia in half a pint of water till the strength is out of the herb, then strain it off and add a teaspoonful of fine salt. Wring cloths out of the liquid as hot as possihle, and spread over the part affected. It acts like a charm. Changs the cloths as soon as cold till the pain is all gone; then cover the place with a soft, dry covering till perspiration is over, to prevent taking cold. Rheumatism can oftcu he relieved by application to the painful parts, of cloths wet in a weak solution of sal soda watcr. If there is inflammation in the joints, the cure is very quick. The wash should be lukewarm.

Milk for Lead Poisoning.—A remarkable case is given in the *Journal de Medecine* of the effect of the habitual use of milk in white leadworks. In some French lead mills it was observed that in a large working population two men who drank much milk daily were not affected by lead. On the general use of milk throughout the works, the colio vanished entirely. Each operative was given enough extra pay to buy a quart of milk a day. From 1868 to 1871, no cases of colic had occured.

Appeal by the State Board of Health.—Our State Board of Health has issued an address to ths people on the suhject of yellow fever, which contains the following appeal: Experience teaches, that when epidemics prevail with sxceptional malignity, they often hreak through the ordinary restraints, especially when local causes favor their propagation. Heuce it is advisable, on this account, as well as for general purposes, that sanitary precautions be adopted, both hy individuals and families, and by boards of health and public authorities. The State Board of Health, therefore, urge upon citizens the necessity of using every precaution to secure perfect cleanliness and purs air in and around their dwellings, and upon the authorities to euforce the laws in relatiou to the cleansing of the streets and alleys, the purification of cellars, cesspools and privies, and ths ventilation of drains and sewers. Diphtheria still rages in a numher of localities on the Pacific slope, and its fatal incursions will be invited by damp and filth, and crowding and other insalubrious conditions. Besides, thero are other diseases from which our populatiou would be protected by the adoption of proper hygienic measures.

Ammonia Versus Malaria.—The Augusta (Ga.) *Chronicle* says: "Ths Georgia Chemical works, which are of a very extensive character, and manufacture annually large quantities of commercial fertilizers, are situated in the southern suhurbs of the city, on South Boundary street. This portion of the city is low and damp, and the people living there had always been suhject to ehills and fever and other malarial diseases. We say *had* been subject, for yesterday morning Mr. Lows, of the chemical works, informed us that the works had exterminated malaria in their neighhorhood. He contended that since the company commenced operations it had routed chills, etc.; and that persons living near thers who once suffersd a great deal, suffer now on South Boundary no more. The effect of the works on the health of the couutry adjacent had been as marked as it had been beneficial. There could he no douht as to the cause of the change. A practical test bad been applied in ths buildings of tbe company. Msn bad been employed there wbo were ague shaken and fever fired, hut who, in a comparatively short time, were entirely relieved of the companionship of their malarial friend. The theory is that the ammonia does the business.

Cooling and Purifying the Air by Means of a Driven Well.—At Messrs. W. D. Andrews & Bros.' iron foundry in Water street, New York, there may he seen in operation a novel apparatus attached to the pump of a driven well. It consists of a cylinder three feet in diameter and four feet high filled with charcoal, through which water from the well percolates. A revolving fan on the upper surface creates a draft, so that where the air enters the office adjoining, a strong, cool breeze is felt, reducing the temperature very decidedly comparsd with the extreme atmosphere, and ths supply thus furnished is perfectly pure. The water has a temperature of 55 degrees, while the air cooled hy it varies from 60 to 64 degrees near the spot where it is injected. On the occasion of a recent visit the outside temperature was 86 degrees; within, near the cold draft, 72 degrees. Wherever steam is available the pump and fan can he worked at a trifling expsnse. The question is suggested whether this method of purifying and veutilating through tbe instrumentality of driven wells may not hs applied to publio halls, court rooms, hanking offices, etc., so as to become invaluable—for example, in tbe new Court House building, wbere the foul atmosphere is extremely prejudicial to health.

Poisonous Gloves.—Neither in its application to paper-hanging nor ball dresses, in hat linings and hose, or even in violst powder, would manufacturers seem to have exhausted the infinite variety of arsenic. *Iron* says: A nice thiug in gloves, whicb we first heard of from Germany, is colored a fine marine blue; and a Major Von B., who bought apair, and exhihited, aftor wearing them, severe symptoms of arseuical poisoning, had them analyzed, when a considerahle quantity of arsenic showed signs of its presencs. Later, several young ladies in Leeds have heen affectsd in a similar way from the same cause; in one instance the symptoms, although local, were very severe. The criminal in such cases—for the man who makes and knowingly sells such deleterious goods is a criminal—is difficult to reach; and it is a real anomaly in jurisprudence that so many slight offences should he severely punished, while a man, for a paltry profit, may poison a whols neighhorhood with absolute impunity, and be paid hy bis victims for doing so.

A Violent Treatment.—A woman near Prague suffered so severely from gout in the arm that she could not ohtain rest or sleep, and the limb in which the disease had settled was rendered entirely useless. Her husband, having heard of a countryman who had heen completely cured of rheumatism after being accidentally stung by a hee, persuaded her to try this disagreeable remedy, which, as he pointed out, could hardly prove so painful as ths disease. She consented, and allowed three bess to bs placed on her arm and to sting her in several places. Surprising results ensued. The patient soon aftsrward fell into a long and deep sleep, the first real sleep she had enjoyed for six months, after which the acute pain disappeared; and when the swelliug produced hy the stings subsided the arm recovered the power of motion and the gout has not since reappeared.

The Week.

The Richmond fire, the Ophir inspection, and the Southern Pacific railroad rumor—these are the prominent topics of the week. The destruction of the Richmond reduction works is a blow to Eureka, to Nevada, and to the English holders, not only in the money loss, which may be $85,000, but in the delay in the development of the mine. A rich strike was reported but a short time ago, and everything was about in readiness to push work with vigor when this put back came. The stock tumbled in the London market, from $55 the day of the fire to $45 the succeeding day. Those that are alive to the lessons always taught by such disasters, may have noticed one little remark in one of the reports of the fire that awakens surprise. The mine is owned and worked by Englishmen, who are supposed to run in tip-top style everything that they undertake. Yet said report remarks that the fire probably originated in the blacksmith shop, which *has been on fire several times lately.* No further comment is needed.

When the courts have settled the Ophir inspection case there will be time enough to moralize on that. It is of very general interest.

The contracts for the continuation of the Southern Pacific railroad to Maricopa wells, about 200 miles east of Yuma, are already pending, and in a very short time the road will be pushed still further, even to the gulf. Not long ago an Arizona paper was advising the people not to have so expensive a luxury as a railroad. When this road is completed no doubt that advice will prove to have been very unwise.

The Pacific Coast at Paris.

"California and Oregon ars the only States in the Union that have received special prizes at the Paris exhibition." This is what our friends are proud to repeat now from day to day. And although the *American Register* tells us that "the most complete exhibit from any State is that from Oregon," Californians have reason to he particularly proud of their honors, hecauss those honors were gained in the face of great difficulties. It will he remembered that the California commission for the Paris exposition asked the Legislature for an appropriation of $30,000 to he applied in giving our State hecoming representation among the exhibits at the great fair. The Legislature waited long before acting on the matter, and then declined to make the appropriation. When this had news came hut one of the committees of the commission had advanced so far in its work as to justify its further procsdure at all odds. This was ths committee on mineral exhibit. This committes was aided financially hy a "puhlic spirited citizen," Mr. Mackey. With this aid as complete a mineral exhibit as was possihle under the circumstences was prepared end sent to Paris, in care of Henry G. Hanks, Esq. It is criticism enough of this collection to say that notwithstanding its acknowledged incompleteness, it has brought California a gold medal, and that it has led to the organization of a miuing and metallurgical company of $1,000,000 paid-up capital, for the purpose of investing in metellurgical works and mines on this coest. This alone should he a lesson to Californians. It shows what a well-prepared exhibit at a fair can really do for any section that is wide-awake and energetic enough to "put it through." Oregon may gain untold advantages in meny directions from her "most complete" exhibit, where we have gained in hut one, the mineral direction.

California gains all the credit for the mineral collection. It is true that the majority of the specimens were from our Stete, nevertheless the whole coast was represeuted. Out of about 1,380 specimens catelogucd, ahout 774 were from California. These came from all parts of the State, 45 counties out of our 50 odd heing named on the lahels. Nevada sent 340; Arizona, 120. Lower Califernia, Mexico, Utah, Oregon, Washington Territory, Montana, Dakota, Wyoming, Colorado, British Columhia, Alaska, the Aleutian Islands, are all named among the localities, and the "Pacific Coast" is stretched in three cases over to the Sandwich Islands, and in one instance away around to Brazil.

That with the material at hand Mr. Hanks has done the very hest that could he done, we may judge from his reputation and from the honors he has received at Paris. It is to he regretted that he and the remainder of the committee did not meet with more hearty co-operation at home. And that the other committees were left out altogether in the cold, we ehall no douht have at some time to mourn.

In the name of the State which he represented, Mr. Hanks presented to the French National School of Mines a duplicate collection, which will remain as a etanding emhlem of our mineral prowess.

THE RAIN PROPHETS.—We heve had our first rain of consequence, and those who are elways plenning for the hringings forth of to-morrow have commenced to look over the rain tahles of previous years, and to speculate on the prohahilities of success and failure thie year in the agricultural and mining industries. The Signal Service report .56 inches of rain since July 1st. This is a larger amount of fall for the same period than has occurred in any previous year eince 1849, excepting 1851. In 1851 there fell in the corresponding period 1.03 inches of rain. The whole rain year of 1851-52 gave 18.44 inches. In the first three months of the rain year 1853-54 there fell .50 inchee. The whole year gave 23.87 inches, which is .57 ahove the average since 1849. Three rain years since '49 that have had no rain during the first three months have given for the whole year ahove the average. On the other hand, at least three that have had no rain during their first quarter have fallen helow, one of them very much helow, the average. So the whole eeason does not turn on the first three months, and it is not yet time to worry and cry out for thirst.

MINING SALE.—Mr. I. S. Van Winkle has just returned to the city after having perfected the sale of his interest in the Nevada gold quartz mine, Nevada City, to Mr. E. Merrifield, for the eum of $75,000 gold coin. This mine is, perhaps, hetter known as the "Soggs" mine, and ie one of the oldest locations in the district. It has prodnced since first opened, a large amount of hullion. It joins the well-known Providence mine on the north, and is supposed to have the same ledge. There is a 15-stamp mill on the mine. The deepest point yet reached is 500 feet, hut the new owner iutends pushing the work and thoroughly developing the mine. The Superintendent is E. L. Montgomery.

TURKISH paper money is depreciating at an alarming rate.

Guide in Purchasing Timber Lands.

Those who wish to avail themselves of the provisions of the act of Congress of June 3d, 1878, entitled "An act for the sale of timher lands in the Stetes of California, Oregon, Nevada and in Washington Territory," must swear in some land office to the following: First, that the particular land desired is unfit for cultivation, and is valuable chiefly for timhsr or stone, as the case may he; that it is uninhahited; that it contains no mining or other improvements, sxcept such as were made for ditch or canal purposes, or snch as were made or helong to the applicant; that, according to the applicant's helief, it contains no valuahle deposit of gold, silver, cinnahar, copper or coal. The applicant must swear that he hes mede no other application under said act; that he does not apply to purchase the land on speculation, hut in good faith to appropriate it to his own exclusive use and benefit; and that he has not, directly or indirectly, mads any agreement or contract, in any way or manner, with any person or persons whatsoever, hy which the title which he hopes to acquire from the Government may inurs in whole or in part to ths henefit of any person except himself.

The applicant must have at least two respectahle and disinterested witnesses, who must answer under oath, among others, the following qnestions:

Are you acquainted with the land ahove described, hy personal inspection of eech of its smallest legal subdivisions? When and in what manner was such inspection made?

Is the land occupied, or are there any improvements on it, not made for ditch or canal purposes, or which wers not made hy or do not helong to the applicent?

Is it fit for cultivation? What causes render it unfit for cultivation? Are there any salines or indications of deposits of gold, silver, cinnaher, copper or coal on this land? If so, what are they and are they valuahle? Is the land more valuehle for mineral, or any other purposes than for the timher or stone thereon, or is it chiefly valuahle for timher or stone? From what fects do you conclude that the land is chiefly valuahls for timher or stone? Other questions relate to the address and occupation of the witness, his disinterestedness and knowledge as to whether the applicant ie seeking for his own henefit only, or that of some one else as well.

The applicant must present evidence in proof of his relation to the Government, *i. e.*, whether he is native born, is naturalized or has declared his intention. He must prove that notice of his intention to purchase has been published for the prescribed time, presenting a copy of the notice and affidavit of the publisher.

DESTRUCTION OF TIMBER IN THE SIERRAS.—The following is from the *Bulletin* of Sept. 23: The destruction of timher in the Sierras muet in a very few years hring ahout important changes. The various corporations engaged in milling and fluming, from Truckee on to the other side of Lake Tahoe, are taking all the available timher in their way. No provision is heing made for the reproduction of the forest growth which is heing stripped from the mountain sides. The young trees are not spared; even saplings are taken for cordwood. Already the effect of this denudation ie heing felt, hoth in California and Nevada, in the diminution of the mountain streams. Some of the companies engaged in stripping the Sierra are already finding difficulty in getting enough water to work their lumher flumes, and in two or three years they will he compelled to ahandon the flumes altogether. At the rate this denudation is proceeding we helieve that ten years hence Lake Tahoe will he rendered uninhahitahle, and that it will he destroyed as a place of popular resort, and as one of the most heautiful retreats on the face of the earth. Iu a few years the denudation of the Sierra upon this side must produce the same effects that it is producing in Nevada. The snows will no longer lie on the gronnd. The spring freshets of our rivers and streams will he violent and destructive. And in the early summer all these watercourses will fail. Then the minere will find their occupation gone. The dehris question will he settled without recourse to litigation, for it will no longer he possihle to employ hydraulic machinery in mining. Agriculture, too, will suffer iu the valleys, and those devastatiug processes will hegin which, in some provinces of France have rendered wide tracts absolutely unhahitahle, and have converted once fertile areas into howling wastes.

THE Sierra Nevada S. M. Co. are considering a proposition to increase the capital stock from $10,000,0000, divided into 100,000 sharee of $100 each, to $50,000,000, divided into 500,000 shares of $100 each.

A MAN named Buck, of Meriden, Conn., has invented a complete steam engine, out of fifteen grains of gold and silver, which will run for twenty minutes on the steam generated from three drops of water.

WITH four metallic qualifications a man may he pretty sure of success in the world. These are gold in his pocket, eilver in hie tongue, hrass in his face, and iron in hie heart.

A Triumph.

About two weeks ago an iron ship, ths *Jessie Osborne*, huilt in Glasgow, and only three years old, ran ashors a short distance from the North Heads. She went hows on, and struck in such a way that a large hole was hroken near the mizzen mast. The hole heing ahout six feet hy thres, and through an iron hottom, and the position of the wreck heiug unfavorahle, the underwriters made little or no attempt to save the vessel and sold hsr for the paltry sum of $2,500 to Captain Griffiths. This gentleman contracted with the Risdon Iron Works Co., of this city, for ths floating of the vessel. Mr. Joseph Moore, superintendent of this company, proposed the plan which finally resulted in succsss. The hallast and leakage sand were forced out of the vessel hy means of a powerful centrifugal pump. At the same time a force of carpenters made ths decks, hatchways and mast holes as tight as possihle, hracing them with heavy timhers. Compressors wsre then started, pumping air into the space hetween the first two decks. In ahout three hours the vessel, transformed into a sort of halloon, hegan to move easily. Whsn she floated clear she was taken into port hy three tugs and sefely docked for repairs. This is the first vessel taken from the rocks outside the Heads.

The owners will reap, heside ths triumph, quite a little rsward. The cost of getting the vessel off, and of the repairs, will amount to ahout $10,000. The vessel will then be worth ahout $70,000. The only unpleasant reflection connected with the whole affair is that the iron plates for repairing the damage must come from the East. The ingenuity, the greetest part of ths achisvement, is ours—why cannot we make the entire accomplishment a San Francisco triumph?

METEOROLOGICAL SUMMARY FOR SEPTEMBER.—The report of the U. S. Signal Service officer, of San Francisco, for ths month of Septemher is summarized as follows: The mean hight of herometer for the month was 29.97; mean temperature, 59.2; mean humidity, 76.1; prevailing winds, southwest; highest harometer, 30.134; lowest, 29.818; highest tempereture, 78°; lowest, 52°; monthly range, 26°; greatest velocity of wind 35 miles per hour; total numher of miles traveled hy wind 7,033; total rainfall, .55 inches. Rainfall in August during former yeare: 1871, .00 inches; 1872, .04 inches; 1873, .00 inches; 1874, .02 inches; 1875, .00 inches; 1876, .38 inches; 1877, .00 inches.

GOLD AND SILVER AMALGAMATION.—In the Forster-Firmin apperatus, as the pulp is fed into a pipe through a hopper, a stream of mercury of required size is introduced hehind it. Behind the mercury again a stream of steam, compressed air, water or other motor, is introduced, which divides the mercury into the smallest particles and then forces it into the pulp. Pulp, mercury and motor mixed, are carried thns forcihly into a chamher, impinging against the sides of which, they are etill more thoroughly mixed. From thie chamher the mixture passes into improved washers, and finally *from 98% to 100% of the precious metal is saved.*

THE important newe topic of the week is the assemhling of the Constitutional Convention in Sacramento. Thus far the contest of organization has occupied the attention of the delegates, and the election of Col. J. P. Hoge, president, hy a majority of one vote, shows a pretty even halence of opinion upon one point at least. A good choice was made for secretary in the person of J. A. Johnson, editor of the Oakland *Times*. We trust the Convention will proceed forthwith to husiness, for their time is short.

SAVING GOLD.—A new machine, called the "Gold Gleaner," cousists of a saucer-shaped copper pan, coated with quicksilver, and made hy very slight power to revolve on a vertical axis. The pulp to he treated is carried hy a stream of water into the revolving pan. The centrifugal force throws the upper stratum of water, together with the light particles of gangue, over the edge of the pan. The heavy gold particles sink into the cup-like central depression, or are taken up hy the mercury. It is said that a six-foot pan will work 100 tons a day and lose not a particle of gold. The inventor is Dr. Hill.

HOW DID HE GET THERE?—Quite a curiosity has come to our notice in the way of a living frog cast np hy an artesian etream on the property occupied hy Mr. Mannen, at the foot of D street. When thrown to the surface the frog was quite transparent, and could hardly he discerned in the water. It was large and lively. There was no poseihility of its getting into the well from the surface, and it must have heen brought up from the hottom.—*San Bernardino Times.*

THE Empire M. Co., of Contra Costa county, have lately struck the hest coal vein yet discovered in their mine.

Mines and Works of Almaden.—No. 3.

(Translated for the Press from "Annales des Mines.")

We see sometimes at the Almaden mine in the midst of the black schiste isolated beds of white magnesian limestone with a saccharoidal appearance, they are only lens-shaped strata (*lentils*) or pockets which cut through a gallery and are not to be found in another one 30 or 40 meters distant from the first. This same limestone forms also little veins and small lodes in the midst of the mass of rock, and not seldom small crystals of cinnabar are found in it.

Fossils are extremely rare in the *frailesca*, nevertheless they have incontestibly found *bilobites* either in the mass of the rock, or else in the fragments of black schiste which it encloses; it is therefore beyond doubt that the *frailesca*, at least at Almaden, belongs to the silurian age.

Let us now recapitulate what we have said of this formation, finishing by explaining its paleontological character, according to M. M. de Prado and de Verneuil.*

The primordial fauna was recognized by M. M. de Prado and Barrande at the eastern extremity of the Sierra Morena, but this fauna disappears near Almaden, where the second predominates. The presence in the schistes, in the sandstones, and in certain limestones of such fossils as *Calymene Tristani, Dalmanites socialis, Asaphus* and others already cited can leave no doubt upon the subject.

The question in dispute is the age to be assigned to the schistes and sandstones with *bilobites*. "The types (*echantillons*) of Spain," wrote M. de Verneuil, in 1855, "have the greatest analogy with those of the United States, but the latter belong to the sandstone of Medina and to the Clinton group, which I proposed to place in the upper silurian rocks, while in Spain we find them at the top of the lower silurian rocks. Let us add in haste, nevertheless, that the limits of the two strata are difficult to precisely establish, especially in Spain, and it is not impossible that the marine plants of the silurian epoch occupy the same position here as in America."

The upper strata of the silurian rocks actually exist in the Sierra Morena, but are reduced to the aluminous schistes which are characterized by the *Graptolites* and the *Cardiola interrupta*. M. de Verneuil has pointed it out some 30 kilometers northeast of Conduo. The point to be elucidated is, "What is the extension of the layers corresponding to the third fauna?" Several engineers, among whom I must mention Don Fernando Bernaldez and Don Ramon Rua Figueroa, occupied themselves with this question.†

The black schiates between Gargantiel and the ancient mine of the Cuevas contain in abundance, Graptolites, e.g., *Grapt. spiralis Barr and Grapt. palmens Barr.* There have been found in the schistes, well preserved samples of *Cardiola interrupta*, and very abundant species of *terebratula*, but always flat, much resembling *terabratula sumata*, and an *orthoceratite*, also much flattened, all species which never seem to be met together with well characterized fauna of the second system.

These geologists are, therefore, led to consider as corresponding to the upper silurian strata all those which contain *graptolites*, even without other fossils, as the black schists of Almaden, and others more to the west, where formerly cinnabar was prospected for, as those of the Arroyo del Lapiz, between Cuevas and Gargientiel, and those which are found a mile and a quarter to the north of Alamillo, and a mile and a quarter south-west of Guadalmes, then farther on in the Rio Javalon, near the Corral de Caracuel; in the last are found *graptolites terabratules*, and *orthaceratites* of the Arroyo del Lapiz with a *Cardiola fibrosa*.

Without being as certain as with the schistes with graptolites, one is inclined to consider that the quartzite with *bilobites* belongs also to the upper silurian. In the mines of Almaden one finds intercalated in the quartzites the aluminous black schistes, containing *graptolites*. If we have not as yet found there the *bilobites*, it is well to remark at least, that they have been found a little more to the west, at the quarry of the furnace yard, and that the fragments of this schiste which encloses the *frailesca* also contains the *bilobites*.

Therefore, even in acknowledging that the line of demarcation between the second and the third fauna is difficult to trace, one would today attribute to the latter the quartzites with *bilobites*, the black aluminous schistes with *graptolites*, and the frailesca.

If we admit this to be so, the strata of Almaden would succeed each other from north to south, although with several repetitions of the same strata, as is indicated in Fig. 3, when the letter F_2 marks the strata referred to the second fauna, and F_3 those referred to the third.

One can see that the primitive order of the strata is very difficult to establish. If we consider the quartzite as belonging to the lower silurian, it would form its upper stratum, if to the upper silurian it would form its base.

2. Devonian System.

In the devonian rocks the achistea are by no means as abundant as in the silurian; they are subordinate to the sandstone and do not present so great a development. Their color is a yellowish gray, greenish or reddish. They are grayish black at Guadalperal, although of a shade very distinct from the silurian.

It is the sandstone which is the most abundant; it is never very hard. Its color varies from white to yellowish and gray, without ever being black. There is also some which is red, being colored by peroxide of iron, but this is much less abundant than on the two slopes of the chain of Cantabria in the provinces of d' Oviedo and of Leon where it is largely exploited. In general, in the Sierra Morena, the devonian rocks are much more ferruginous than the silurian rocks.

It is in the sandstone that are found most of the fossils characteristic of this period, the most abundant are the following:

Terebratula undata, T. Mariana, T. reticularis, T. Orbiguyana, T. conceutrica, Spirifer subspeciosus, Sp. *Bouchardi*, Sp. *Verneuili, Leptæna Murchisoni, Productus subaculeatus, Phacops latifrons, Dalmanites laciniata*, etc.

The limestones of this layer are of a color nearly always grayish; they contain fewer fossils than the sandstone.

It is very difficult, in the absence of fossils, to determine whether one has to do with silurian or devonian rocks. One cannot say where the one begins and the other ends. We can say that the great masses of schistes are silurian, that the very ferruginous rocks are devonian, that these never attain a great hight, while the silurian quartzite, being more solid, has better resisted the action of denudation. It is this latter which crowns the numerous hills or "cerros," form great embattlemented walls, giving to the whole country a peculiar orographic appearance. In walking several leagues on the edge of these straight layers, one is obliged to admit that they are folded back upon themselves, thus repeating themselves, and that erosion has removed the upper part. But when one looks for those which correspond to this folding one cannot be sure of their identity, because their thickness often varies as does also the character of the rock. On the other hand the mines of Almaden have attained a depth of 285 meters below the town, without disclosing the least tendency to folding to the one side or the other in the always vertical layers.

The elevation of the rocks which occupy us has been accompanied with diverse accidents. Here we see beds which have been compressed laterally in the line of direction, which has produced singular foldings. There are interrupted strips which seem to have been strongly drawn out, and at the same time thrown back again, sometimes forwards, sometimes backwards. In the midst of the quarzite one sees fragments of schist, and in the middle of the schist one meets sometimes blocks of quartzite or of limestone. The layer of schist envelop these blocks, which indicates that the rock has not taken the structure which characterizes it after the occurrence of these accidents.*

The elements for a study of the upheavals which have successively corrugated the surface of Spain are still wanting. Above all it is necessary to have a good detailed geological map, and there is none. It will then be necessary to have a geological map on a scale less reduced than that of M. M. de Verneuil et Collomho, and from a geographical map less inexact. It is this task, the making up of a general geological map, that the commission of the geological map has undertaken.

It is only when this first work will have been finished that one will be able to reconstruct with some certainty the history of the Peninsula at diverse epochs.

. ALMADEN QUICKSILVER MINES.

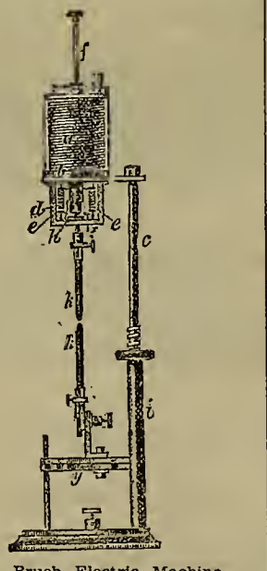

Fig. 2. Brueh Electric Machine.

Many lamps have been invented which accomplished this more or less perfectly, but they were all of such extremely delicate mechanism that they were liable to get out of order with the slightest change of adjustment. Such lamps, while admirably adapted to scientific research, as they gave excellent results in the hands of skillful physicists, were at the same time of no practical value on account of their extreme delicacy.

The Brush lamp seems to do away with this objection better than any other machine we have seen. It is simple in its mechanism and not liable to get out of order, while, at the same time, it is sufficiently delicate in its self-adjustments to produce a very equable current.

The lamp is shown in Figs. 2 and 3, in which *a* is a helix of insulated copper wire, resting upon an insulated plate, *b*, upheld by the metallic post, *c*. Loosely fitted within the helix is the core, *d*, partially supported by the adjustable springs, *e*. Or in the newer instruments by a piston moving in an oil dash pot for the same purpose. The rod, *f*, passes freely through the center of the core, *d*, and has at its lower end a clamp for holding the carbon pencil. A washer, *h*, of brass surrounds the rod, *f*, just below the core, *d*, and has one edge resting on the lifting finger attached to the latter, while the other edge is overhung by the head of an adjustable screw atop, *x*.

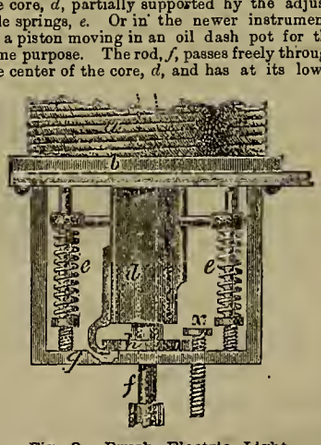

Fig. 3. Brush Electric Light.

The metal post, *c*, is supported and guided by a tubular post, *i*, secured to a suitable base plate. Attached to the lower end of the post, *c*, and passing out through a slot in *i*, is the arm, *y*, supporting an insulated holder for the lower carbon.

If now one conducting wire from the machine be connected to the base plate, and the other to the lower carbon holder, the current of electricity will pass up through the posts, *i* and *c*, through the helix, *a*, and rod, *f*, and the carbons, *k k*, thus completing the circuit.

The axial magnetism produced in the helix will draw up the core, *d*, and it, by means of the lifting finger, will raise one edge of the washer, *h*, which, by its angular infringement against the rod, *f*, clamps and lifts it to a distance controlled by the adjustable stop, *x*, but separating the carbon points far enough to produce the light.

As the carbons burn away, the increased length of the electric arc increases its resistance and weakens the magnetism of the helix, and therefore the coil, rod, and carbon move downward by the force of gravity, until, by the shortening of the arc, the magnetism of the helix is strengthened, and the downward motion arrested. When, however, the downward movement is sufficient to bring the clutch-washer, *h*, to the support, *l*, it will be released from the clamping effect of the lifting finger, and the rod, *f*, will slip through until arrested by the upward movement of the core, due to the increased magnetism of the helix.

The normal position of the clamp washer is within the edge under the adjustable stop, just touching the support *l*, the office of the core being to regulate the slipping of the rod through it. If, however, the rod through any cause falls too far it will instantly and automatically be raised again as at first, and the carbon points thus continued at the proper distance from each other.

In order to operate with longer carbons, thus obviating frequent changes, the sticks of carbon are electroplated with a thin film of copper so as to increase their conducting power. The slight irregularities in the production of this light seem to be due to the impurities which exist in the carbons. These are chiefly silica and iron. These substances seem to oxidize in the heat of the arc, and to form a fusible silicate which forms a stalagmite upon the negative carbon; this extending into the arc first increases the conductivity, thus widening the distance of the carbons, and then, as this takes place, melts and drops off, thus weakening the current and temporarily diminishing the light. This trouble will, however, be probably soon diminished by the production of carbons containing less than one-half of one per cent. of silica and iron.

The Brush Electric Light.—No. 2.

We next come to a description of the electric lamp itself. The difficulty of obtaining a simple lamp which would adjust itself for the varying consumption of its carbon has been the second great objection to the use of the electric light.

At the Palace Hotel

Our readers have a chance to judge for themselves of the practical working of the light. The large and beautiful court of the hotel, a room about 85 feet wide by 120 feet long by 140 feet high, has been lighted for the last two months back by four lights of about 1,000 candles each. The lights are each inclosed in frosted globes so that the illumination, instead of being of a blinding intensity, is almost as mild as that of the moon itself. The change of scene and atmosphere of the court, as one comes in from the raw air of a San Francisco evening, is as vivid as if one were ushered into a moonlight scene in the tropics. The lights are placed in the vertical plane running through the center of the court, two at about 40 feet from the floor and two at about 100 feet from the floor. They are arranged so as to divide the length of the hall into nearly equal thirds, *i. e.*, 40 feet apart and from the end walls.

Senator Sharon is so well pleased with the success of the whole apparatus that he has ordered another machine of 12,000 candle power; this, with the machine he has already, will give him control of a 16,000 candle light. This illuminating power it is proposed at present to utilize as follows:

There will be fixed in the following places in the hotel lamps of the Brush pattern:

In the court	4 Lights.
In the dining-room	3 "
In the restaurant	1 "
In the breakfast-room	1 "
In the kitchen	1 "
In front of hotel	1 "

The lamps being fixed, it is only necessary to move the key on the switch-board to turn off or on any one of these lights, or to concentrate it all in one, as may be desired. Some such plan as the following will probably be adopted: The two upper lights in the court will be switched into the dining-room until 8 P. M. At this hour, one of the dining-room lights, of 3,000 candle power, will be switched in front of the hotel, the other two will be switched back into the court. The other lights will burn continuously till 12 or one in the morning.

A 25 horse-power engine will be erected in order to furnish sufficient power in case it is decided to still further extend the application of the lighting.

There is no doubt that the subject of electric lighting is at last thrusting itself upon the public attention in a way, which will necessitate its consideration. In the lighting of large hotels, public halls, theaters, factories, mills, etc., there is no doubt but that it will prove a formidable antagonist to gas lighting. It might, perhaps, be well to suggest that the employment of a powerful electric-light upon Goat island, might do away with the necessity of the mournful fog-horn, which disturbs, at present, our sleepless citizens. In the navigation of the new Oakland harbor, also one or two such lights would be of great convenience to all concerned. We take pleasure in referring for further particulars to the President, Mr. Wm. A. Kerr, No. 903; Battery street, or the Superintendent, Mr. M. D. Law, at the Palace Hotel.

The following companies have been listed on the San Francisco Stock Board during the past few days: Fairfax, South Lady Bryan, Greer, Mt. Hood, Sabine, De Haro, Geo. Douglas, Vancouver, Yolo, Paradise Valley, Real Del Monte, Rustler, University, Santa Mina, Dudley, Jupiter.

RUPTURE.

Another Wonderful Cure Effected by CALIFORNIA ELASTIC TRUSS!

CALIFORNIA ELASTIC TRUSS COMPANY, W. J. Horne, Proprietor.—DEAR SIR:—I feel that I owe it to you and to humanity to write the fact that I have been SUBSTANTIALLY CURED of a bad case of Rupture of 30 years' standing, by one of your incomparable Trusses, which I purebased from you three months ago. I cannot describe the suffering, both physically and mentally, that I have undergone during that period; and now I feel like a new being. I have worn all kinds of Trusses, both Steel and Elastic, and never received any permanent relief until I tried yours. Its simplicity of construction, and facility with which it can be adjusted, and the ease and perfect freedom to the motions of the body with which it can be worn without causing any irritation, are its chief merits, and it is a perfect supporter. I have not had any sign of a return of the Rupture since the first day I put it on, and feel that I am PERFECTLY CURED. It is invaluable, and the fact should be known to the world. You can refer anyons to me on the subject of their merits.

I am truly yours, ALFRED J. BURKE,
Chief Mail Clerk S. F. *Daily Evening Post.*
San Francisco, July 20th, 1878.

Endorsed by the Medical Profession.

SAN FRANCISCO, July 9th, 1878.

California Elastic Truss Co.:

After practicing medicine many years in this city, during which time I have had an extensive experience in the application of all kinds of Trusses, I can and do recommend yours as the best in every respect, for it is as near perfection as modern science can make it. It has many advantages over the torturing steel-hoop Trusses, which inflict great injury on the hips and spine, bringing on other distressing ailments, such as lumbago, morbid affections of the kidneys and numbness in the lower limbs, all of which are avoided by wearing the California Elastic Truss. It is not only a perfect retainer, combining ease and comfort, but the pressure can be changed to any degree. It also remains in the proper place at all times, regardless of the motions of the body, and is worn night and day with perfect ease. It is superior to any of the Elastic Trusses now in the market, while it combines the merits of all. 1st—It is easily adjusted on and off with snaps, doing away with straps and buckles. 2d—The universal spring between the plate and pad prevents all irritation, which is a godsend to the sufferer. 3d—The pad is adjusted on and off in an instant, and can be changed for any other size and form most suitable to the case. In fact, it combines every quality essential to comfort and durability, and is unequalled in lightness, elasticity, natural action, and artistic finish. Many of my patients who are afflicted with hernia are wearing them, and all shall in the future, for I think the great ease by which these purely scientific appliances are made efficacious, is truly remarkable. You can refer any parties to me on the subject of their merits. I remain yours truly,

L. DEXTER LYFORD, M. D.,
Physician and Surgeon,
609 Sacramento street, San Francisco.

A Physician's 45 Years' Experience.

COLUMBIA, Tuolumne Co., July 16th, 1878.

W. J. Horne, Esq.—DEAR SIR:—For some time past I have used, in my practice, the California Elastic Truss, with entire satisfaction in most cases of complicated hernia of both sexes. During a practice of 45 years I have found no Truss that would, with the same ease and certainty, retain the required adjustment, the pressure being always under the immediate control of the patient. The simplicity and ease of application is of itself a guarantee to every experienced physician. I have the honor to remit by mail the amount due, knowing that I contribute to the alleviation of afflicted humanity.

Yours truly, J. P. TIBBITS, M. D.

It is constructed on scientific principles and sells on its merits. If you want the best Truss ever manufactured, don't forget the name and number.

Trusses forwarded to all parts of the United States at our expense, on receipt of price.

Send for Illustrated Catalogue and Price List, giving full information and rules for measuring.

I. A. HEALD, Proprietor.

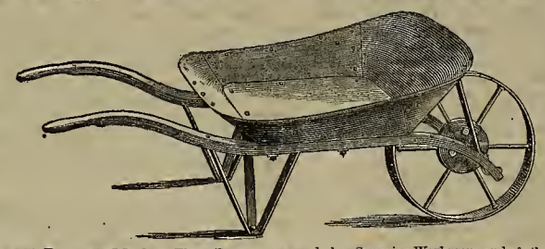
TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, $2.00. Address, Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome St., San Francisco.

FRANCIS SMITH & CO.,

MANUFACTURERS OF

THE PATENT CHANNEL IRON WHEELBARROWS,

SHEET IRON PIPE.



SHEET IRON PIPE.

The Strongeet Barrow Made. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from Twenty-five to One Hundred Gallons.

Iron Cut, Punched, and Formed for making pipe on ground, where required. All kinds of tools supplied fo making pipe. Estimates given when required. Are prepared for coating all size of pipes with a composition o Coal Tar and Asphaltum.

Office and Manufactory, 130 BEALE STREET, San Francisco, Cal.

GRAND HEADQUARTERS FOR MUSICAL BOXES.

M. J. PAILLARD & CO.,

Manufacturers and Importers of all kinds of

MUSICAL BOXES —FOR— Holiday, Birthday —AND— Wedding Presents,

MUSICAL BOXES —FOR— Holiday, Birthday —AND— Wedding Presents,

OF STANDARD REPUTATION.

Our stock embraces the latest novelties, the newest and most pleasing airs, and the most approved appliances for rendering them with every shade of musical expression.

☞ We offer this season many new improvements that must be seen to be appreciated; therefore buyers coming to San Francisco are invited to examine our stock—THE LARGEST IN THE CITY.

☞ Medal and diploma awarded at the Centenniai Exposition to our establishment in Switzerland for excellence in manufacture, durability, volume, purity of sound and superior workmanship. Also, medal awarded at the Mechanics' Institute Industrial Exhibition, San Francisco.

REPAIR DEPARTMENT.—Our workmen are especially educated to all kinds of intricate repairs, so that all epairs entrusted to us will meet with careful, skillful and prompt attention. We are recipients of many special atents for improvements in musical boxes.

KING ENGINE.

The Only SAFE BOILER.

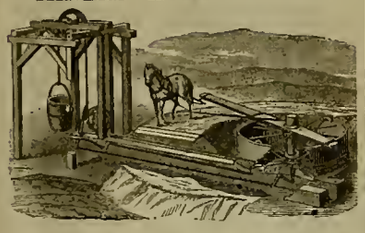
SAVES One-half the FUEL Consumed by Others.

The engine is adapted to all the various industries in which small power is required. The engines are FIRST-CLASS, and are made from two to twelve horse-power.

The smaller sizes are especially recommended for irrigating land, driving printing presses, or manufactories. The larger sizes are being extensively introduced in small quartz mills, where their economy of fuel and portability especially commend them. Send for circular.

REYNOLDS, RIX & CO., Sole Agents,
18 & 20 Fremont Street, San Francisco, Cal.

MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,
18 & 20 Fremont Street San Francisco, Cal

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$3 50
One man, per day	3 00
Wood, 1½ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

JUDGE WM. WEBSTER, Paymaster Mine, Reno, Nev.
LEWIS CHALMERS, Manager Exchequer and IXL Mines, Silver Mountain, Cal.
J. S. CONE, Vice-President Tehama County Bank, Red Bluff, Cal.
R. H. CAMPBELL, Superintendent Afterthought Mine, Redding; Shasta County, Cal.

For further information, apply to
D. J. O'HARRA, Reno, Nevada.

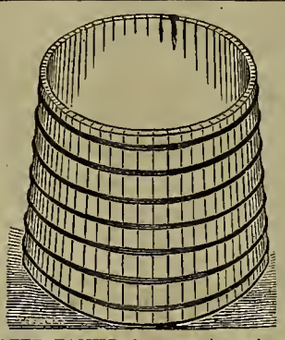
SAN FRANCISCO.



WATER TANKS of any capacity made entirely machinery. Materials the best in use; construction excelled. Pan Staves, Tubs and Oak Guides for mining purposes a specialty.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission and Fremont Streets.

Printing Type For Sale Very Low.

We have on hand some 400 to 500 lbs. of brevier, in good condition, for sale at a bargain. Will sell a part only if desired. Second-hand cases to match. Also a font of bourgeois in first-rate order, with cases. Also a cabinet and upwards of twenty fonts of good display type, not very old and but little used. Some of the fonts are large, of modern style, and what might be termed good substantial display type for advertisements and job printing.

A good proof press will also be sold at a greatly reduced price from cost.

We can fit out a good country printing office nearly complete at a moderate cost. Call and see the material.

CHROME IRON WANTED.

Parties having any vein or deposit of Chrome Iron will please send all particulars as to location, distance from railroad or other communication with this City.

Address, CHROME IRON,
SCIENTIFIC PRESS, No. 202 Sansome St., San Francisco.

TO OWNERS OF REBELLIOUS ORES.

Persons interested in mines of rebellious ore, or having on hand any ore that is not satisfactorily worked, yielding less than it assays, will do well to notice the following offer. The undersigned is in possession of a new secret process which he is willing to try on any ores sent to him. If a pound or more of ore is forwarded to his address, he will test it with his process, and acquaint the owner with the results and the cost per ton for working. Address,
S. P. BRESSLER, Elkhardt, Indiana.

SUSPENDED WIRE ROPE TRAMWAYS.

This system of transport is peculiarly adapted for the carriage of minerals over rough countries. Heavy gradients and long spans easily overcome, and cheaper than by any ordinary means.

Transmission of Power by Wire Ropes.

The power of water or steam can by this means be carried for long distances, with great economy.

For estimates and practical information apply to

Mining Share Market.

An inflated market has lost some of its wind. That is the history of the week in this department. Not even a market can subsist forever on sympathy, and although the ore in Sierra Nevada has been reported from day to day as better and better, there has been a general tumble among the parasites. Compare our table of highest and lowest quotations with the list of daily quotations, and learn more than we can tell here.

Meanwhile the mines themselves work along regularly enough, and if there is ore left in the Comstock they will not be long in finding it. The surplus of money in the hands of those who have made realizing sales, combined with the further proofe of the richness of the region furnished by the Sierra Nevada and other strikes, has led to great activity—activity that is, it may be added, of the right kind—in as yet little developed neighborhoode of the Comstock. Witness the resurrection of the North Con. Virginia mine and the increased nnmber of mining claims recorded. This latter feature is very noticeable in the Bodie district, where important strikes have recently been made in the Tioga, Spaulding and South Bullion. Not only are new claims being staked out and recorded, but not long after the appearance of new names, there is announced the incorporation of a company, with capital, bearing those same new names coupled with a more business-like aspect than is found in the mere location notices of the proepector. If each new claim gives rise to a new company, and each new company lists its stock in the boards, we soon must have longer hours and perhaps new boards, so full will be the market.

THE Rochester tumbler works recently shipped eleven carloads of tumblers in one week. The works employ 300 hands, who are kept constantly busy.

IT is said that the general business outlook in New Orleans is good notwithstanding the epidemic.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C.

WEEK ENDING SEPTEMBER 17TH, 1878.

HOT AIR ORATES—Adna H. Buckhout, Oakland, Cal.
WEEDERS—Kenneth P. Grant, San Buenaventura, Cal.
TENT POLES—Harry C. Cushing, S. F.
UNLOADING NETS—Oscar Marshall, Stockton, Cal.
CAR TRUCKS—Georga Vincent, Stockton, Cal.
TRADEMARKS—Alexandor E. Mintie, San Francisco, Cal., medicinal preparation.

A Library for Inventors.

We have at our patent offices, No. 202 Sansome street, corner Pine, a complete set of Patent Office reports, containing engravings and claims of EVERY PATENT ever issued in the United States.

We have also a complete set of the MONTHLY VOLUMES issued by the Department, with full detailed description and large drawings of all the patents issued since the time when these volumes were first published.

A set of all the LAW BOOKS ON PATENTS is also on our shelves ready for reference. We have also the British Commissioners reports, Canadian Patent Office reports for all British North America, full files of MINING AND SCIENTIFIC PRESS, *Pacific Rural Press*, *Scientific American*, *Scientific American* supplement, *American Artisan* and other American and foreign scientific and mechanical journals, as well as mechanical dictionaries: chemistries, encyclopedias, and other works ol reference.

Inventors and patentees ara WELCOME TO EXAMINE at their leisure any of tha booke in the above eata, and wa shall be glad to give them any assistance in hunting up what they want.

Our library is the most completo of its kind on tbe Pacific Coast in avery raspect, and wa are continually adding to it as occasion damands.

DEWEY & CO.,
Patent Agents and Publishers,
No. 202 Sanaome street, corner Pine, San Francisco.

SAN FRANCISCO, October 2d, 1878.

Mrs. Caroline A. Williams, Sacramento House, corner 3d and Mission Sts., San Francisco. — MADAM: — It is with great pleasure that I now inform you of the complete cure ot a tobacco cancer on my jaw, whieh had troubled me for saveral months, and which was pronounced a very severa case, requiring a surgical operation I tried one bottle of "Aunt Carrie's Salve and Pila Ointment," and immediately after the first application I commanced to feel relisved, until now all pain is gona and no scar ie left. I cheerfully recommend tha "Magic Salve and Pila Ointment to all. Respectfully, G. R. EVANE.

FOR PRINTINO MATERIALS, the publishers of this papa patronize Mardar, Luse & Co., Pacific Type Foundry and Printers' Supply Warehouss, 532 Clay atreat, San Francisco, Cal. Sand them a stamp for specimen aheet, and say advartieed in this paper.

Yours respectfully, J. H. CAVANAUGH.
Walla Walla, Dec. 24th.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Keystone Quartz Mining Company.—Principal

place of business, San Francisco, California. Location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of August, 1878, an assessment of fifty (50c.) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary at the office of the Company, northwest corner Pine and Sansome streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the eighth day of October, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-eighth day of October, 1878, to pay the delinquent assessmeut, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, northwest corner Pine and Sansome streets, San Francisco, California.

Hackberry Mill and Mining Company.—

The regular annual meeting of the stockholders in the Hackberry Mill and Mining Company, for the election of five Directors to serva during the ensuing year, and for such other business as may properly come before the meeting, will be held at the office of the Company, No. 306 Clay Street, San Francisco, Cal., on Monday, the seventh day of October, 1878, at the hour of 12 o'clock noon.

ED. B. PARTRIDOE, Sec'y.

Orion Mining Company.—Location of Prin-

cipal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3,) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansoma Street (up stairs), San Francisco, Cal.

Pocaho tas Mining Company.—Location

of principal place of business, 411½ California street, San Francisco, California. Location of Works, El Dorado County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 14) levied on the 14th day of August, 1878, the several amounts set opposite tha names of tha respective shareholders, as follows:

Namsa	OLD ISSUE. No. Certificate.	No. Sharaa.	Amount.
Roberts, W G, Trustee	128	100	$450 00
Roberts, W G, Trustea	130	100	450 00
Roberts, W G, Trustee	131	100	450 00
Roberts, W O, Trustee	132	100	450 00
Roberts, W O, Trustee	133	100	450 00

Roberts, W G, Trustee	135	100	450 00
Roberts, W C, Trustee	136	100	450 00
Roberts, W O, Trustee	137	119	535 50
Staples, A, Trustes	100	360	1350 00
	NEW ISSUE.		
Roberts, W C, Truetee	113	17,500	$26,250 00
Kohler & Chase, Trustee	122	89	133 50
Staples, A, Truetee	128	268	399 00
Staples, A, Trustee	125	270	418 50
Staples, A, Trustes	11	100	150 00
Staples, A, Trustee	27	100	150 00
Staples, A, Trustee	23	100	150 00
Staples, A, Trustee	117	50	75 00
Staples, A, Trustes	118	100	150 00

And in accordance with law and an order of tha Board of Directors made on the 14th day of August, 1878, so many shares as may be necessary of each parcel of such stock will be sold at public auction at the office of tho Company, Room 9, 411½ California street, San Francisco, Cal., on Wednesday, the twenty-third day of October, 1878, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

M. C. SOUTHARD, Sec'y.

Office, Room 9, No. 411½ California street, San Francisco, California.

Summit Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D. 1878, an assessment. (No. 5,) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the nineteenth day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Sec'y.

Office, Room 5, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.

—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three (3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assesament shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 541 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878. D. A. BROWN, Sec'y.

Office, No. 541 Sacramento street, San Francisco.

IONE VALLEY, Cal., January 20, 1878.

MESSRS. DEWEY & CO.—*Gentlemen:*—I received my patent last night, and was glad to find that you were so prompt in the matter. I am pleased to give you the credit due you for the faithful and honorable manner in which you have discharged your duty in getting my patent. I shall hereafter recommend you to the public as having discharged your duty with honor. Yours, etc.,

Works, Fremont and Howard Sts. | San Francisco, Cal. | Office, No. 213 Fremont St.

MANUFACTURERS OF

Marine Engines and Boilers,

Propeller Engines either High Pressure or Compound Stern or Side Wheel Engines.

Mining Machinery.

Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

Mill Machinery.

Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores Water Jackets, Etc.

Sugar Machinery.

Crushing Rolls, Clarifiers, Vacuum Pans, Air Pumps, Concentrators, Bag Filters, Charcoal Filters, Blow-up Tanks, Coolers and Receiving Tanks.

Miscellaneous Machinery.

Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Oil Well Retorts, Powder Mill Machinery, Water Wheels.

Engines and Boilers of all kinds, either for use on Steamboats and made in accordance with the Act of Congress regulating the same, or for use on land. Water Pipe, Pump or Air Column, Fish Tanks for Salmon Canneries of every description.

Boiler repairs promptly attended to and at very moderate rates.

PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

Manufacturers of

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING, AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Bailey Air Compressor, Howell's Improved White Furnaces, Walker's Compound Steam Pumps, Etc.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

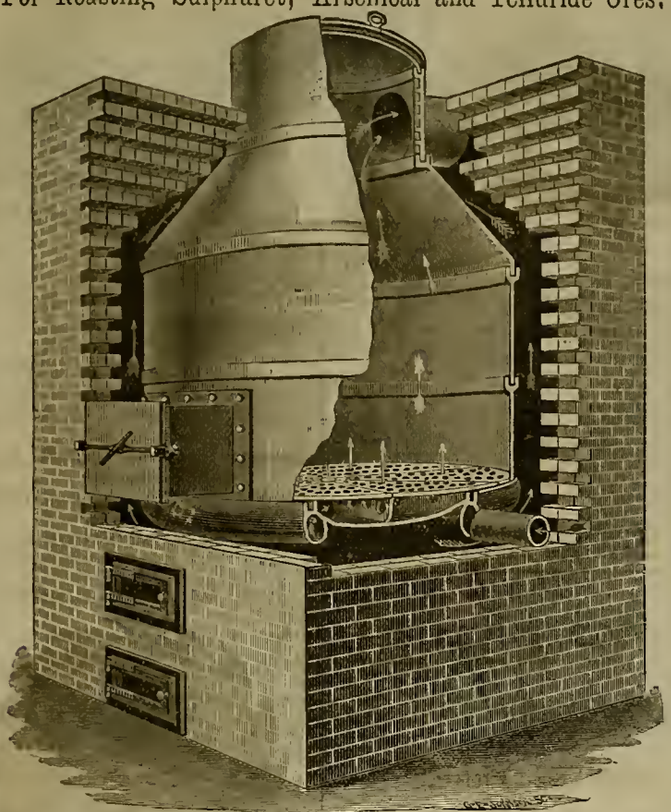
Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arsenical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

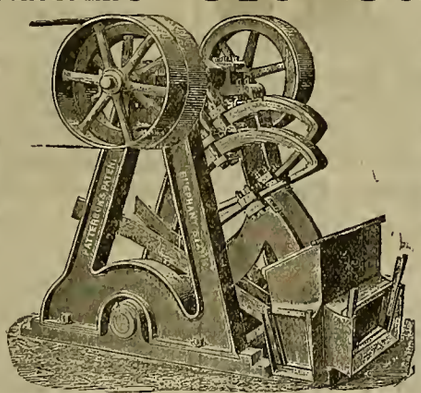
The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

Z. A. WILLARD, Patentee,

No. 1031 Market Street,

SAN FRANCISCO.

Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 1½ tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two pairs, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco For particulars, apply to

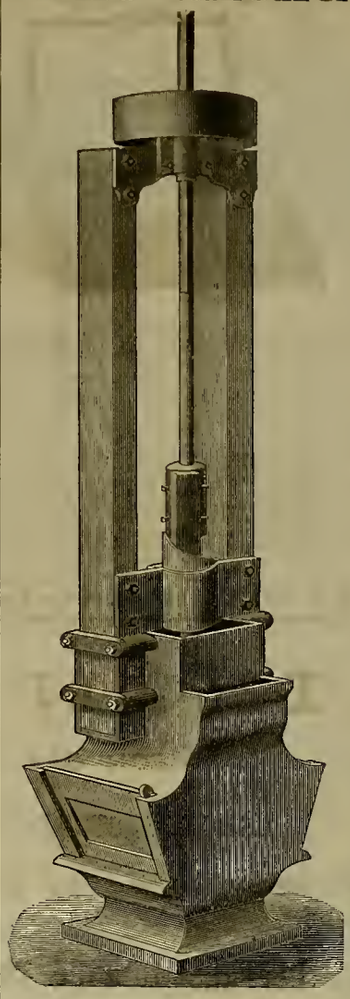
EDMUND WHITE, Care of A. B. Grogan, 705 Sansome St.

GOLD, SILVER AND COPPER MINING, Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills. Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

The Kendall Battery.



STEPHEN KENDALL, Patentee.

This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

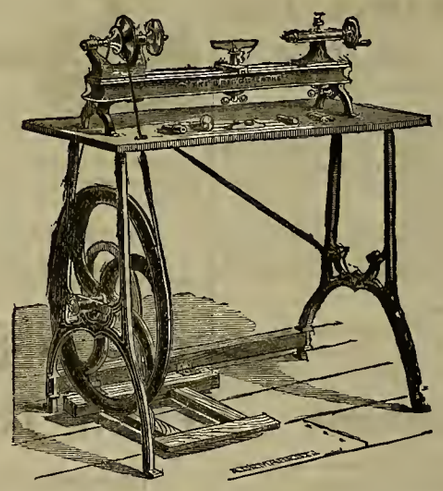
Rankin, Brayton & Co.,

MANUFACTURERS,

Pacific Iron Works, San Francisco.

THE BRIGGS LATHE.

Combines Superior Excellence in Quality and Finish with Beauty, Strength and Completeness.



This Lathe will turn a piece of Wood or Metal 12 inches long and 6 inches in diameter.

It can be used with equal advantage for Drilling, Polishing, Sawing, etc. The length of bed is 24 inches; the spindle is made of steel, has a conical bearing, and can be tightened as it wears. The bed, head, tail-stocks and cone pulley are of cast iron and the centers of steel. The following pieces are furnished with the lathe: 2 T rests, 1 face-plate, 2 plain centers, 1 spur center for wood, 1 plain drill-chuck, 1 drill-pad, and 1 center left blank to turn down as a fitting for a universal chuck. The bench weighs 81 pounds, is made of iron, with a black walnut top, and has a driving-wheel measuring 22 inches in diameter, with three grooves for changes of speed.

PRICE OF LATHE, AS ABOVE, $25.

DUNHAM, CARRIGAN & CO.

SAN FRANCISCO

IMPROVEMENT IN

FILTERS AND COOLERS.

Patented July 31st, 1877.

—INTENDED FOR THE—

Perfect Purification of Water,

—AND A—

Reduction in Temperature Below that of any Well Water Possible in the Vicinity.

The use of ice as a medium of purification is deceptive, and only tickles the palate at the expense of good health. The use of ice is also expensive, and in many localities unobtainable. To overcome these difficulties the inventive genius of mankind has been thoroughly taxed, and the Patent Office is filled with models of different devices under the name of Filters and Coolers.

In presenting the

Peters & Walters' Filter and Cooler

To the public, we feel that we are doing good service to the community, and furnishing them with a machine that will be durable, and one that fully accomplishes the end for which it is intended.

For particulars or rights apply to

THOS. C. WALTERS,
612 Greenwich Street, San Francisco,
Or to JORDAN PETERS, Petaluma, California.

Comfort and Health Promoted!

WOODWARD'S

Clothes Clamp, for Bedsteads.

Patented December 18th, 1877.

WE CLAIM:

1st.—It holds the bed clothes firmly to the footboard without injuring them in any way. 2d.—If the covering is short, the clamps will hold them in place, when nothing else will. 3d.—Clothing can be adjusted when clamped at the foot as well in the dark as in the light. 4th.—For cribs and children's beds, it has no equal. 5th.—A woman can change clothing and make up three beds quicker and easier than she can make one without it. 6th.—When sheets are not to be changed, the clothes can be adjusted in two minutes. 7th.—Spreading on bedding with footboard turned down is as convenient as laying cloth on a table. 8th.—It hides all inequalities and leaves the bed covering much smoother than it can be made by tucking under. 9th.—The bedding can be thrown back over chairs to ventilate without opening the clamps, and adjusted again as easily as closing a book. 10th.—Turn down the footboard and the bedding can be removed in a body or separately much easier than from other beds.

The Fixtures Can be Applied to any Bed, New or Old.

State and Manufacturing Rights for sale by
F. WOODWARD.
No. 56 Eleventh Street, Sacramento, Cal

THOMAS'

IMPROVED APPLE PARER,

CORER AND SLICER.

Letters Patent No. 88,755.

This Machine is durable, easily adjusted and kept in order; does its work complete; slices the fruit of even thickness; so prepared, it dries evenly and quickly, say in 36 hours, thus avoiding a long exposure to the miller or moth producing the worms.

It does its work better and quicker than any other machine. Boys and girls can use it with great facility; many considering TWENTY BUSHELS a fair day's work, while some have pared and sliced THIRTY BUSHELS in twelve hours.

County rights for sale by

J. R. CRANDALL,
Auburn, California.

P. S.—An engraving illustrating this machine will appear soon.

TO LUMBERMEN.

The Property of the Duncan's Mills Land and Lumber Company,

Sixty miles from San Francisco, at the terminus of the North Pacific Coast Railroad, Sonoma County, is offered for sale on very favorable terms.

There are 3,500 acres of Redwood Timber land, new steam Saw-mill, general store, dwellings, logging railroad, water works, etc.

Satisfactory reasons for selling will be given to prospective purchasers.

Also, if desired in connection with the above, a lumber yard on the Bay of San Francisco, having superior facilities for shipping by rail or by water, and having a large and constantly increasing business.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, OCTOBER 12, 1878.

VOLUME XXXVII Number 15.

California Mining District, La Plata County, Colorado.

(Written for the PRESS.)

Geographical Position.

This district is situated on the bead waters of the Rio La Plata, in what is known as the "La Plata Mountains"—a partially ieolated epur that projects southwesterly from the great San Juan range, and separated from it by a high plateau—deusely wooded with fir, and quaking asp timbor and underbrush. On this bigh plateau are found the principal sources of tho east fork of the Dolores river, flowing westerly, and of the Hermosa creek, flowing casterly into the Rio Las Animas, one of the principal tributaries of the Rio San Juan. Tho southerly slope of the La Plata mountains is drained by the Rio La Plata, and tho west flank by the Rio Mancos.

By reference to Hayden's drainage map of Colorado, the position and lines of approach to these mountains can be more clearly underetood than hy any description that can be written.

Geographical Features.

The central mass, or core of the La Plata mountain system, consists of Plutonic rocks of the porphyritic types common to tbe San Juan range, such as trachytee and gray feldspathic porphyrius—more or less fissile and friable. A large portion of tbis porphyritic central mass is thoroughly impregnated with iron pyrites, whicb greatly facilitates its disintegration on the exposed surfaces.

The internal forcee tbat produced the upbeaval appear to bave been exerted in a nearly vertical direction, pushing the porphyritic mass up tbrough the sedimentary beds of tbe carboniferous, Triassic, Jurassic and cretaceous ages, and lifting their ruptured edgee up to a high angle on the south and west flanks. On the north and east flanks of upheaval, tbe bedded formations appear to bave been lifted bodily to an elevation of 10,000 to 11,000 feet above tho sea.

Hesperue Peak is the highest point in the La Plata mountains, measuring 13,135 feet above tide water. The general level of tbe tablelands and foothille on the south and west sides ranges from 7,500 to 8,500 feet above the eea. The general outline of this mountain group is an oval, with its longest diameter ranging east and west, about 25 miles, by 15 or 20 miles north and south. The La Plata river has cut a deep canyon from north to south through tbe heart, or central core of the porphyry upbeaval, thus exposing to view the series of bedded structures above enumerated, giving a fine opportunity to study the metamorphic action of the igneous center upon the sedimentary beds in contact with it.

The mouth of the canyon, at the south base of the mountains, is narrow with precipitous eides, except a narrow bench along the west bank of the river. About two miles up the canyon the porphyritic rocks make their appearance in the form of dikes and wedge-like spurs radiating from the central core; also in flat intrusions between the separated beds of metamorpbic shales and sandstones, thus sbowing the manner in which the broken edges of the beds have been lifted apart, and tbe spaces filled with the porphyritic paste by lateral pressure. As the porpbyry is approached, the canyon widens greatly on the west side, forming a crescent-sbaped basin (about six miles long) in the heart of the mountains. This feature is owing to the facts that the central core of porphyry is eofter, and more readily denudcd hy eurface iufluences than tho surrounding metamorphic rocke. By reference to the geological section herewith prescnted, this feature of the canyon will bo readily understood. The section is taken along the west side of the canyon through the center of the basin in a line S. S. W. to N. N. E. At the north end of the basin the river deflects to the nortbeast, while the section line cuts through tbe east flank of Mt. Hesperue.

In tbe engraving *A* represents tracbytic porphyry; *B*, carboniferous beds; *C*, trias, red sandetone; *D*, jura and permanian beds; *E*, cretaceous sbales and sandstone; *F*, lowcr coal measurcs; *G*, upper or great La Plata coal measure; *H*, bouldcr bed. Nearly all the surrounding bigh peaks are capped over with porphyritic dobris, showing that tho igneous core origiually overtopped all tho surrounding country, but owing to its loose texture and the sulphide of iron with which it is so thoroughly impregnated, it has crumbled away more rapidly than the metamorphic rocks, hence the basin now occupies the position where the original mountain overlooked all the neighboring elevations.

GEOLOGICAL SECTION, N. S—THROUGH LA PLATA MOUNTAINS—LOOKING WEST.

The geological section was not taken by actual measurement, but from careful examinations of the different rock formations and estimate of their approximate thickness and relative positions. The order of occurrence as marked in the section is correct. That portion of the section extending south of the La Plata mountains, showing the coal measures, is somewhat shortened, but correct as to tbe order of occurrence of the beds.

The coal bed marked *F* is the lower coal measure of the cretaceous age, and is stratigraphically identical with the "Castle valley" coal measure in Utah. The large coal measure marked *G* in the south end of the section is in the middle zone of the cretaceous beds, and corresponde in character and position witb the "Spring valley" coal fields in Utah. This coal measure is of great economic value to La Plata county and southwestern Colorado. It varies in thickness in the southern portione of La Plata county—from 10 feet up to 50 or 60 feet between the floor and roof. Where the Los Animas river crosses tbe outcrop there is over 40 feet thick of good clean coal that will make excellent coke. It is exceedingly rich in bitumen and gas. Tbe area covered by this great coal measure is estimated at over 600 square miles within the bounds of La Plata county, and ie cut across by the Pinos, Florida, Animas, La Plata and Mancos rivers, thus giving excellent facilities for easy and cbeap exploitation.

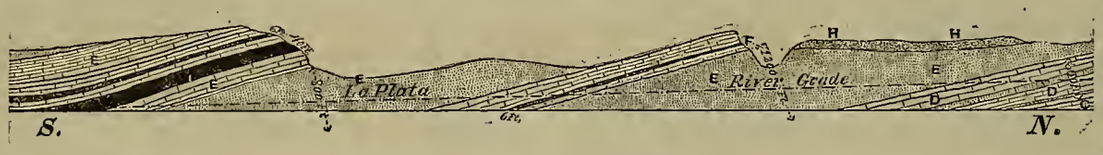
This brief outline description of the physical features and geological formations of La Plata mountains, and the coal measures of the "mesa" country south of them, will give a good general idea of their salient features so far as the rock formations and their relative positions are concerned.

Tbc mines in the La Plata mountains are exceedingly varied in character, both as to structure, and the metals contained in them. Gold, silver, lead, copper, zinc, iron pyrites, tellurium, platina, etc., are fonnd in the croppings of numerous veins and deposits in and near the porphyritic rocke. Some of the best defined veins are found in the metamorphic beds near tbe porpbyry dykes tbat radiate from the central core of the mountain system. Many of tbe lodes are in deep-seated true fissures, and carrying oree rich in gold and silver. There are a few bedded deposits, or rather impregnated beds, of very promising character. Tbeee are confined exclusively to the metamorpbic beds near tbe porphyry dykes, and the flanks of tbe central core of upheaval. As a general rule, however, the veins are small, ranging from six inches to two feet; in a few exceptional cases the veins are larger. A majority of the locations made will not he worth working at present, or at any time in the near future. There are probably a dozen or two of the best locations that will pay to work now, if the proper amount of care and skill is brought to bear upon tbeir development and general management.

The local facilities for working tbese mines are the best that I have seen in any of the numerous mining centers of the San Juan country. They are within a few miles of the "Mesa" country at the southwest base of tbe mountains, where the climate ie mild, timber and water abundant, and the stock range for cattle, sheep, and horses, is not excelled in quality or extent in southweetern Colorado. There is rich farming land enough on the La Plata, Mancos, and Dolores rivere to make sevcral hundred good farms, and a climate unsurpassed for health and purity of air by any part of the globe. These important local advantages ought to insure the early development of the mines in the La Plata mountains. The greatest preeent needs are good roads, cheap transportation, and rapid communication with the great business centers of the country. All these aids will come when tbe great natural resources of La Plata county are eeen and understood by intelligent farmere, enterprising miners and capitalists.

J. E. CLAYTON, Mining Geologist.

La Plata county, Col., Sept 30th.



CONTINUATION OF SECTION SOUTH—SHOWING COAL MEASURES.

Mr. L. C. PARKE, of the firm of Parke & Lacy, agents for tbe Burleigh drills and other mining machinery, 417 Market street, returned this week from a five montbs' tour to Europe. During his trip he visited England, France, Austria, Italy, Switzerland, etc., and spent a couple of weeks at tbe Paris exhibition. The trip was made solely for pleasure, but he bad an opportunity of comparing at different places, especially at the exposition, the European mining machinery with that manufactured in this country, and says there is nothing they have that we want. In the matter of rock drills particularly, their machinery is clumsy and cumbersome in the extreme. Mr. Parke looks well and hearty after his vacation from business.

The Mines and the Courts.

In the Nineteentb District court, in the suit brougbt by Hugh J. O'Reilley against J. C. Flood and the bonanza firm, to rccover $150,000 for sale of his interest in the Wbite & Murphy mine to tbe defeudants, tbe proceedings were euddenly concluded by Judge Wheeler granting a nonsuit on the ground that O'Reilley had been Superintendent of tbe Wbite & Murphy company, and had bought tbe mining claim witb the White & Murphy money, and taken a deed of the claim in his own name; that by the evidence, the statement of O'Reilley to tbe contrary notwithstanding, it was fully shown by letters and accounts of O'Reilley witb the defendants, which were produced in evidence, that the Consolidated Virginia company was grantee of the White & Murphy company, and that O'Reilley was bound to convey to tbe Coneolidated Virginia company, witbout any cousideration, and therefore his claim to recover from Flood & O'Brien $150,000 as a consideration for conveying the claim to tbe Consolidated Virginia company under an agrcement with Flood, could not be sustained, because such agreement was without consideration, it being the duty of O'Reilley under the agreement to convey tbe claim to the Con. Virginia company witbout heing paid therefor.

In the Eleventh District court, Judge Williams rendered a decieion in the case of the Lincoln mining company vs. Antoine Vessalovicb et als. This case involved tbe ownership to some mineral ground in the bed of Sutter creek, within the limits of tbe town site of Sutter. The Lincoln company claimed the ground by reason of a title under the town site, wbicb deed was given hy T. M. Pawling, tbe County Judge, in 1871, and had heen used by the company for several yeare as a place for the deposit of tailings, but never worked as a placer mine. In 1870, the defendant, Vessalovich, put up two notices, claiming 2,000 feet of the ground, whicb claim was duly recorded, but from tbat time up to 1877, he was prevented from working the claim in consequence of a dam erected by tbe Amador mining company, known as the Badger dam, which obetruction he had no authority to remove, until in 1877 he purchased the said dam from the Amador mining company. The pointe at issue in the euit were whether title under the town site would hold good against claims located prior to the granting of the town site, and whether the fact that defendants bad failed to perform tbe work required by law upon their claim was an abandonment of their rights under the circumstances. The judge decided in favor of the defendants. As the decision is of considerable importance to other localities in this county, we summarize the main points covered by it as follows: 1. That the act of Congress granting town sites exempts from the grant all placer claims located prior to the purchase of the town site. 2. That placer claims located subsequent to the town site are uot good againat parties claiming under the town site. 3. That the mining customs of the district provide for the holding of a claim without work, so long as an obstruction existed; so that although the claim was located in 1870, and remained unworked until 1877 by reason of an obstruction, the mining laws sustained the right of the parties to the claim.—*Amador Ledger.*

THE San Jose M. M. and D. Co. have increased their capital stock from $250,000 to $500,000, divided into 100,000 shares of $5 each.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Eureka Mine, Fresno County.

EDITORS PRESS:—Having seen a small article in your paper regarding the Eureka mine near Pine city, located hy Baker, Lingo & Co., I, the discoverer, take pleasure in sending you a few facts in regard to farther developments of the mine. We ran an open cut that tapped the vein at a depth of 15 feet on the foot wall, ran tbrough the vein 10 feet, and found no banging wall. We took out 16 tons of ore, average assay, $141.35 in silver. It was splendid smelting ore, requiring no other metals to work it. We have also located water right and timher for smelter. There is an ahundance of both water and timher.. Considering the facilities for working the ore, and the showing on top, we have one of the hest prospects I ever have seen. I send you a small piece of ore and will send you a better specimen soon. The hoys are now at work on a tuunel to tap tbe veiu at a depth of 90 feet. Respectfully yours,

J. S. LINGO.

Coarse Gold, Fresno Co., Sept. 25, 1878.

Yosemite Ramblings.

F. C. S., has handed us journal notes on a trip to Yosemite. A party of four started from San Francisco with their own team and "camped it" np to the hig valley. Tbey went from Oakland down the hay, through Pacheco pass, across the "hot and dry plains" of the San Joaquin, and via. the Mariposa road to Yosemite. They stopped on the way to take a look at the hig trees. Reaching the valley they camped temporarily at Bridal Veil meadows, but finally located more permanently at the north end "under Union point." It seems that, making this camp headquarters, the party made numerous little excursions ahout the valley, visiting all points of interest and climbing to any eminence that promised a good view.

"As it is said that the tour around the Yoemite valley can he made on the summits of the mountains, it was proposed by a friend that we should try to accomplish the feat. It was agreed that we should start from Inspiration point, travel as far as possible, and at the expiration of four days return to the valley proper." We gather from the notes that this little expedition was not a complete success. Tbe adventurers lost their way, made at least one complete circle of wasted travel, were forced to throw away much of their "pack," and when they returned to the valley were tired and torn.

Utilization of Bittern on the Pacific Coast.

Tbe following is an abstract from an article prepared by Mr. F. W. Morse, of Chico, Butte county, at the University of California. It is based upon an analysis made hy him of bittern from a salt works on San Francisco hay. It is of interest to both practical and scientific men. As will be seen, it opens the question of the further development of an old, if not the establishment of an altogether new industry on our coast:

The subject of bittern being eo closely connected with that of salt, it seems surprising that all of its constituents and properties were not known and studied hy chemists long before it did receive their attention. The most ancient records in history have frequeut references to salt and its various uses. Frequent theories were advanced as to its constitution and chemical properties. Altbough earliest history has recorded its uses and properties, yet in no case does it give the manner of its production, or the source from whence it came. The earliest mention of producing salt from sea water was ahout the time of the Conquest, when a detailed account of the methods of its production was given.

Hazling island and the Firth of Forth have long been noted for tbeir production of salt from sea water. The inhahitants of all countries living near the seasbore have some means of extracting tbe salt from the water.

The methods of procuring it vary with the surrounding circumstances. As the sea is the source of salt for the inhabitants of the sea coast, so the inhahitants of the interior have a corresponding source, from which they derive tbsir supply. The evaporation of old inland seas has formed immense beds of salt, and are now being mined by tbe inhabitants of the inland towns.

These salt beds being the insoluble constituents of the ancient seas would, hy the study of tbeir products, show to the chemist of what the original seas were composed. More recently these have become a subject of thoughtful study, and careful analyses have been made of their products. It was in these salt beds that the first attempt was made to utilize the waste products, hence the first study of hittern. The cost of producing the salt was considerable, as it was mostly concentrated hy artificial evaporation. The salt was first redissolved and then recrystallized, leaving tbe more soluble salts hehind. All the products less soluble than salt are deposited with it, and the remaining liquor is what is generally called "hittern" or "mother liquor." Bittern, therefore, is the residue left after the salt has heen taken from the mixed products of the old salt heds; or it is the liquor left after salt has heen extracted from sea water. It is a transparent liquid, of a slightly yellowish color, with a specific gravity of 1.2791.

From the various analyses of sea water one can, by making use of the degreee of solubility of the different salts it contains, almost determine the salts which form thé bittern. All the soluble salts are still in solution, and all those salts which have reached the point of their solubility bave heen deposited and exist as impurities of the salt. It may not be out of place to give an outline of the changes which the water uudergoes in passing from the sea to tbe condition in wbich we find it.

Varying temperatures and other causes would, of course, complicate the changes and make it too complex to he treated in detail here. The following, taken from a work on the production of salt from sea water, is a connected view of the more apparent changes.

The average density of the sea water as it enters the ponds for solar evaporation is ahout 1.025. As the evaporation continues the density constantly increases. When the solution attains a specific gravity of 1.143, the least limit for the solubility of calcium sulphate is reached, and that immediately begins to deposit, as a white crystalline layer, on the hottom of the ponds. This may continne until all the Ca SO⁴ has been deposited, or until the eolution has reached a density of 1.21. Up to the density of 1.286 the evaporation takes place in the open air, the salt heing deposited nearly pure hetween the densities of 1.21 and 1.286. The liquor I analyzed was drawn off the soil before it reached a density of 1.286. The evaporation could be continued further without injury to the salt and yet be quite profitable to the produeers, as the salt is deposited quite pure until the solution has reached a density of 1.2992, and may he deposited, although not pure, when at a density of 1.32. From a specific gravity of 1.286 the evaporation becomes more difficult and must he conducted over clayey soil and where great surfaces and shallow depth of liquid can be exposed to the heat of the sun.

Solar evaporation continues until the liquor reaches a density of 1.321, heyond which the salt becomes mixed with too much magnesium salts to be of usc as common salt. The further changes will be taken up when speaking of the commercial importance of hittern.

From the above we see that all the sulphate of calcium would have been deposited before reaching the specific gravity of the hittern in band. The presence of the large amount of chlorides of magnesium and sodium would also make it impossible for sulphate of calcium to remain in the eolution, as a solution coutaining 22% to 23% of these chlorides cannot contain a trace of that salt. The analysis gives no trace of it in the bittern, but a good test for its presence was found in the original salt.

By the usual processes of qualitative analysis, the following constituents were found. potassium, sodium, irou, magnesium, aluminium, chlorine, bromine, sulphuric and phosphoric acids, organic matter and water. Bromine, aluminium and phosphoric acid were in such small quantitics that it was almost impossihle to determine their amounts, it requiring, in the case of aluminium, a large quantity of bittern to get even a test for its presence.

Some of the details of the analysis are here given. The specific gravity of the hittern was found to bc 1.27913. The following interesting remarks are made about the test for iodine: "In the course of the qualitative analysis, a careful search for iodine was made, hut in no case was there the slightest trace discoverable. Its wide distribution in sea water would lead one to expect that at least a trace of it could he found in hittern. Many of its salts hring quite eoluble, it would remain iu solution even after the liquid had reached a density greater than 1.2791. Moreover the presence of the large amouut of chlorides would also tend greatly to increase the soluhility of the salts of the iodine. However, if the iodine existed, as it usually does in the ocean, as an iodate of calcium, it may possihly have been deposited with the salt."

Regarding the organic matter, he says: "It would be quite impossible to determine the exact organic compounds which form the organic matter. The greater part is probably the result of decomposition of vegetation near the ponds. Crenic and acrylic acids have heen found in sea water and may form a very small part of the organic matter in this case.

"The iron present may be considered as only a trace. Iron seldom, if ever, exists in sea water. It is supposed by some chemists that a small amount of sesquioxide does exist, but in determinahly small quantities. In this hittern it was prohably taken up from the soil on which the salt was deposited."

The result of the quantitative analysis was as follows:

Magnesiuu	6.210%
Chlorine	19.124%
Sulphuric acid	2.553%
Potassiuu	1.437%
Sodium	.924%
Ferric oxide	.017%
Organic matter	1.356%
Water	68.379%
Total	100.000%

Traces only of aluminium, bromine and phosphoric acid.

The manner in which these elements are combined to form the salts of the bittern is quite uncertain. Considering the affinities of the elements and the order in which the prohahle combinations would naturally be deposited if subjected to evaporation from a saturated solution, I bave concluded that tbe elements above enumerated are combined as follows in the bittern:

Chloride of sodium (common salt)	2.35 %
Chloride of potassium	2.741%
Chloride of magnesium	21.935%
Sulphate of magnesium	3.400%
Ferric oxide	.017%
Other matter	1.356%
Water	68.379%
Total	100.178%

The commercial importance of hittern has hut recently become known. Formerly the liquor was immediately returned to the sea after the salt was crystallized out, the salt being considered the only element of iuportance. The ease with which the salts of potassium and magnesium are now extracted, makes it a very profitahle husiness to he carried on in connection with tbe regular salt trade. A firm on the Mediterranean sea was the first salt company which made use of tbese salts.

They have since made it quite a subject of study to adopt means of working all these secondary products, uutil now, they use all the sodium, potassium, magnesium, chlorine and sulphuric acid.

The water they use, at a density of 30°, contains only 16.6 chloride of magnesium, 4.6 chlorido of sodium, and two sulphate of magnesium to 100 parts of water.

By this means a very small amount of potassium and magnesium existing in the sea water can he extracted with profit, as the water must first he concentrated to obtain the salt. To make the work successful the climate must he adapted to the particular purpose. The difference in temperature hetween day and night must be enough to allow the sulphate of magnesium to he deposited at night and the salt during the day. The following ie a synopsis of the method pursued by the Mediterraneau salt works: It may he divided into three parts according to the product sought. 1st. Is a mixture of sulphate of magnesium and chloride of sodium. 2d. A douhle sulphate of potassium and magnesium. 3d. A douhle chloride of potassium and magnesium. At the point of saturation of these double salts they are deposited almost pure.

The first product yields sodium and magnesium, simply hy redissolving and allowing the sulphate of sodium to crystallize at a low temperature, the sulphate of magnesium remaining in solution. The secoud product consisting of double sulphates of potassium and magnesium, are separated in a similar manner, it heing only necessary to dissolve the crystal of the double sulphates in hot water and allow the different salts to crystallize out while cooling.

Various other methods of separation may be adopted; one known as Le Blanco's process ie often used when it is desired to use the potassium in the manufacture of carbonate of potassium.

After the double salt is separated from the bittern, the further working depends eutirely upon the salt we wish to manufacture from it.

The third product is probahly of the most importance. Consisting entirely of double chlorides, it is only necessary to change them into simple chlorides, and hy the action of a moist atmosphere the chloride of magnesium absorhs moisture and runs off, leaving the chloride of potassium almost pure. Or they may be separated hy resolution and recrystallization. The chloride of potassium being deposited pure when the evaporation is not carried so far tbat the double chlorides are deposited. By repeating the process all the chloride of potassium may be eeparated, leaving pure chloride of magnesium. From this pure chloride of magnesium, maguesium compounds and hydrochloricacis is manufactured. Even the bromides in the sea water can be saved by proper treatment with sulphuric acid and hinoxide of manganese.

To determine whether the bittern under consideration will ever be of any commercial importance, we must consider all the natural advantages of the situation, the means of disposing of the products, and see if there is sufficient of the salts to warrant an investment of this kind.

The analysis shows a very large proportion of chloride of magnesium, which, hy the proper treatmeut, could easily be separated from the bittern as a third product, and would he quite free from the other impurities.

From this chloride hydrochloric acid and magnesium compounds could be ohtained hy the usual method of treatment. It contaius fully as large quantities of the important constituents as that worked from the Mediterranean sea. Its density is somewhat greater than that already worked at the Mediterranean sea, hut the per cent. of chloride of magnesium is correspondingly greater. It contains chloride of potassium in considerable quantities, while the other has no notice of it at all. It also has a much larger proportion of sulphate of magnesium.

As far as the products iufluence its commercial value, it certainly would pay, as it is richer than the hittern we compared it with, and yet that is worked with profit. When we tako into consideration the natural advantages of the situation, it hecomes a much more complex problem. Its disadvantages may he so great that it will never be of much importance.

The Atlantic and Pacific Forests.—No. 6.

[By PROF. ASA GRAY.]

But now other and more theoretical questions come to be asked, such as these:

Why should our Pacific forest region, which is rich and in some respects unique in coniferous, be so poor in deciduous trees?

Then the two hig trees, Sequoias, as isolated in character as in location—being found only in California, and having no near relatives anywhere—how came California to have them?

Such relatives as the Sequoias have are also local, peculiar, and chiefly of one species to each genus. Only one of them is American, and that solely Eastern, the Taxodum of our Atlantic States and the plateau of Mexico. The others are Japanese and Chinese.

Why should trees of six related genera, which will all thrive in Europe, he restricted naturally, one to the Eastern side of the American continent, one genus to the Western side and very locally, the rest to a small portion of the Eastern horder of Asia?

Why should coniferous trees most affect and preserve tbe greatest numher of types in these parts of the world?

And why should the Northeast Asian region have, in a comparatively small area, not only most coniferous trees, hut a notably larger number of trees altogether than any other part of the northern temperate zone? Why should its only and near rival he iu the antipodes, namely, here in Atlantic North America? In other words why should the Pacific and the European forests be so poor in comparison, and why the Pacific poorest of all in deciduous, yet rich in coniferous trees?

The first step toward an explanation of the superior richness in trees of these antipodal regions, is to note some striking similarities of the two, and especially the number of peculiar types which they divide hetween them. The ultimate conclusion may at length be ventured, that this richness is normal, and that what we really have to explain is the absence of so many forms from Europe on the one hand, from Oregon and California on the other. Let me recall to mind the list of kinds (*i. e.*, genera) of trees which eurich our Atlantic forest but are wanting to that of the Pacific. Now almost all these recur, in more or less similar hut not identical species, in Japan, North China, etc. Some of them are likewise European, hut more are not so. Extending the comparison to shrubs aud herhs, it more and more appears, that the forms and types which we count as peculiar to our Atlantic region, when we compare them, as we first naturally do, with Europe and with our West, have their close counterparts in Japan and North China; some in identical species (especially among the herbs), often in strikingly similar ones, not rarely as sole species of peculiar genera or in related generic types. I was a very young botanist when I began to notice this; and I have from time to time made lists of such inetances. Evidences of this remarkable relationship have multiplied year after year, until what was long a wonder has come to be so common that I should now not be greatly surprised if a Sarracenian or a Dionæa, or their like, should turn up in Eastern Asia. Very few of such isolated types remain without counterparts. It is as if nature, when she had enough species of a genus to go round, dealt them fairly, one at least to each quarter of our zone; hut when she had only two of some peculiar kind gave one to us and the other to Japan, Manchuria, or the Himalayas; when she had only one, divided these hetween the two partnere on the opposite side of the table. The result, as to the trees, is sees in these four diagrams. As to number of species generally, it cannot be said that Europe and Pacific North America are at all in arreare. But as to trees, either the contrasted regions have been exceptionally favored, or these have been hardly dealt with. There is, as I have intimated, some reason to adopt the latter alternative.

We may take it for granted that the indigenous plants of any country, particularly the trees, have been selected by climate. Whatever other influences or circumstances have been brought to hear upon them, or the trees have brought to hear on each other, no tree could hold its place as a member of any forest or flora which is not adapted to endure even the extremes of the climate of the region or station. But the character of the climate will not explain the remarkably paucity of the trees which compose the indigenous European forest. That is proved by experiments, sufficiently prolonged in certain cases to justify the inference. Probably there is no tree of the northern temperate zone which will not flourish in some part of Europe. Great Britian alone can grow double or treble the numher of trees that the Atlantic States can. In all the latter we can grow hardly one tree of the Pacific coast. England supports all of them, and all our Atlantic trees also, and likewise the Japanese and North Siheriau species, which do tbrive here remarkably in some part of the Atlantic coast, especially the cooler-temperate ones. The poverty of the European sylva is attrihntable to the absenco of our Atlantic American types, to its having no magnolia, liriodendron, asimina, negundo, no æsculus, noue of that rich assemhlage of legu-

MECHANICAL PROGRESS.

Bar Iron Direct from the Ore.

We have made mention before of a direct process for making bar iron direct from the ore as invented by Du Pay, and we learn from the *American Manufacturer* that favorable progress is being made with the process. The following is an outline of the process: Iron ore, carbonaceous matter and a very little fluxing material in the proper proportions are ground and mixed together wet, to the consistency of mortar, under heavy chilled iron wheels. A large pan will hold 1,000 pounds of ore, and the whole mixture will be completely ground in twenty minutes, by two men who first pass the large lumps of ore through a Blake crusher. The mixture is then shoveled into annular sheet iron cases (No. 26), which may have neither tops nor bottoms. They are placed close together on a truck, and remain there for a few hours, when they become compact and solid. The truck, holding enough of these cases for a charge, is brought in a convenient position to slide them on to a broad "peal," and, one by one, in a few minutes the operator places the whole charge into the furnace. He then has nothing to do except to regulate his fire and damper until the ore is well reduced to metallic iron. He then piles two or more together, and withdraws them to the squeezer, or he may work them off separately. After thus being compressed into a well-made bloom they are passed through the rolls without reheating, and come out smooth muck bar, five or six inches wide and three-fourth inch thick. In place of squeezing, the lump of metal, if preferred, may be forged under the hammer. Being quickly made into a bloom, either by hammer or squeezer, by throwing them again into the furnace, the waste heat they then receive, gives, at a low cost, a high quality of reheated iron.

An English Tribute to American Inventors.

The great English "opinion maker," the London *Times*, in its review of our exhibits at the Paris exposition, pays the following tribute to American inventive genius: The activity and insight of the American inventive genius develops more that is new and practical in mechanism than all Europe combined. The New Englander invents normally; his brain has a bias that way. His mechanizes as an old Gresk sculptured, as the Venetian painted, or the modern Italian sang. A school has grown up whose dominant quality, curiously intense, wide spread and daring, is mechanical imagination. It is not the professed mechanic or ironmaster who invents, any more than the schoolmaster or the farmer. As Tintoretto left his dyeing to become a great painter, the American, be he bank clerk, pedagogue, backwoodsman or plowman, turns in his busy brain some problem of his own, suggested by his experience of ill or too slowly done work, and like Archimedes in his bath, he suddenly finds it and rushes away with his "Eureka" to some place where he can make his model or get it made—more frequently the former for want of funds to get it made. There was a want the man had felt, an ideal to be worked out, and in his meditation suddenly the thing flashed on him, and is complete in all its essential parts from that moment.

EXPORTS OF AMERICAN WINDMILLS.—We read that the exports of windmills from Eastern manufactories are quite large. A portion of the cargo of a bark which lately loaded at New York for New Zealand consisted of 50 large windmills, ordered by parties in New Zealand, and chiefly for raising water on stock farms, where the wells are sometimes 200 feet deep. They are required to supply tanks at the railroad stations, and for various agricultural purposes. Cuba and South America are both good export markets for this sort of machinery, windpower being in growing favor on the sugar estates of Cuba to pump molasses, and windmills are occasionally used for similar purposes in the sugar warehouses at Havana and Cardenas. English windmills are made after the old Dutch fashion, with broad fans, and the general construction is heavy.

BESSEMER GAINS A POINT ON SIEMENS.—The English correspondent of the *American Manufacturer* announces the abandonment by Mr. Siemens of the manufacture of Siemens-Martin rails, apparently on account of the great cheapening of Bessemer. Bessemer rails are said to be being delivered at port of lading at the unprecedented low price of £5 13s 6d, and forebodings are expressed that the steel rail makers will yet find a way of still further depreciating the cost of their product. Siemens-Martin steel is about to be used for sheets for the use of the tin plate makers, and it appears to be only a question of time now when Bessemer and Siemens-Martin steel shall be so cheap that they will take the place of wrought iron for almost every purpose.

AN IMPROVEMENT IN SOLDERING IRONS.—A novel soldering iron, the invention of M. Paquelin, was recently described before the Academy of Sciences, Paris. Its distinctive feature is a platinum receptacle, in which heat is instantaneously generated with air and petroleum vapor or air and coal gas.

Mechanical Piracy.

In its letters from the Paris exposition, *Iron* has the following statements: Some of the American exhibitors have been complaining of wholesale piracy on the part of Swedish and other manufacturers, and in some cases the castings of American machines have been used right in the sand, the copyists not even effacing the pattern maker's numbers, etc. There is a reaper made by Adriance, Platt & Co., which is thus copied by a Swedish and by a Canadian firm, the copies being exhibited in competition with the original. Messrs. Fay & Co. say that a British firm has thus copied their wood-working machinery. There is one thing to say, in this connection, that any machine with castings copied directly from American models will be dangerously weak, as the marked superiority of the American cast-iron enables machines to be built there much lighter than is safe to copy with inferior metal.

But the worst case of "cheek" that has yet come to view is that of the "K. K. Privilegirte Hombeker und Marienthaler Eisenwaaren Industrie und Handels Actiengesellschaft," of Moravia, in Olmuz. This "imperially and royally privileged" establishment shows, in the Austrian annex, padlocks suspiciously American in model and finish, their duplicates being exhibited in the United States section by Mallory & Wheeler. Close inspection shows that these are not merely copies of this firm's American locks, but are really *made* by the Connecticut firm referred to, bearings the private numberings of that house's catalogue, and numberless little unmistakable "ear marks" not so perceptible to the uninitiated.

HEATING ANOTHER CITY BY STEAM.—Engineer Holly's plan for distributing steam heat through a city by means of pipes just as gas and water is distributed, is gaining ground at the East. The gas company at Springfield, Mass., has advanced so far with the application of the method that a formal petition was presented and readily granted by the city council for leave to run the necessary pipes through Elm street from the gas works and across Main street to Sanford street. Alderman George Dwight, Superintendent of the gas company, said that if this experiment is a success, the company will hereafter ask the city for leave to go through other streets for the purpose of heating houses by steam. The pipes will be laid directly beside the gas pipes. The company propose to try the experiment this fall, to satisfy themselves of its feasibility, and if it succeeds, as they doubt not it will, it cannot fail of being a benefit to the community, and one that there will be a loud call to have carried out still further.

FRENCH MINTAGE SINCE 1795.—The authorities of the French mint have drawn up a statement of its operations from 1795 to the end of 1877. The year 1795 was chosen to start with, as it was in that year that the first coins on the decimal system were struck. From 1795 to 1876 the collective value of the gold coinage was as follows: 100-fr. pieces, 44,346,400 fr.; 50-fr. pieces, 46,568,700 fr.; 40-fr. pieces, 204,432,360 fr.; 20-fr. pieces, 6,708,899,520 fr.; 10-fr. pieces, 1,013,641,610 fr.; 5-fr. pieces, 233,440,130 fr. Of gold coins, only 20-fr. pieces were struck in 1877, their value being 255,181,140 fr.; their number 12,759,057. The total number of franc pieces issued was 193,000,000; of half-franc pieces 89,000,000. The collective value of the silver money coined from 1795 to 1876 was 5 milliards 510 millions of francs. The collective value of the bronze coins issued, comprising 10 centimes, 5 centimes, 2 centimes, and 1 centime is 62,702,785 fr. 40 c.

CARBON BRONZE.—The *Iron Age* speaks highly of the carbon bronze introduced by a Pittsburg manufacturer. Its basis is copper, but from this metal various substances should be eliminated in order to insure its purity. For the past five years it has been fairly tested, and has proved all that its inventor has ever claimed for it. As proof of permanence and stability attention is called to a set of bearings of this material which have been in constant use for the past four years and a half in Lucy furnace coke car No. 9. Carbon bronze costs but little more per pound than ordinary rod brass, and is from three to five times more durable. It is therefore at least 50% cheaper than an other metal now in use for journal bearings.

LUMINOUS WATCH DIALS.—We read in an exchange that a notable improvement in watches is reported from Chaux de Fonds, Switzerland. By a peculiar process the figures on the dial are rendered luminous, so that if exposed once during the day to the sunlight they remain phosphorescent and visible throughout the night. Preparations are being made for the production of these watches on a large scale.

AN ARCHITECT NOT A MECHANIC.—It has recently been decided in a Pennsylvania court that an architect cannot obtain a mechanic's lien on a building as security for professional services in preparing plans and specifications, although he may do so for such a portion of his services as properly falls under the head of building superintendent in examining materials and supervising the actual work of construction.

A SMALL THING IN ENGINES.—A Meriden watchmaker has made a steam engine weighing only fifteen grains. The works are of silver, and three drops of water are enough to keep them in motion twenty minutes.

SCIENTIFIC PROGRESS.

How the Siberian Mammoths were Entrapped.

At the meeting of the British association Mr. Howarth read a paper on the difficulties surrounding the extinction of these huge elephants in Siberia. One of the theories hitherto propounded to account for its sudden disappearance, he said, was that it lived in the central parts of Central Asia, and that the carcasses were floated down the large rivers in that territory to the sites where the remains were now found. The examination of the stomach, however, showed that the mammoth lived on larch or birch trees growing at the verge of woods, near which the remains of the animals were found, and their position showed that they had not wandered far when they were entombed. After looking at the problem from every side, he had come to the conclusion that there had been a sudden and violent change of climate in Siberia, which had frozen the previously soft ground, and had also preserved the mammoth as in a huge meat safe. Although the mammoth had even originally lived in the place where he was now found, it was impossible that he could live there now, owing to the absence in that part of the food which would be necessary to sustain him. Such trees as he used to live on were only now found about 500 miles from the spot where his remains were discovered. The natural corollary that followed from this theory was, that something similar must be postulated with regard to other regions. The conditions in which the elephant was found in Siberia were precisely similar to those in which it was found in the northwestern part of Russian America, and precisely the same as those in the Great lakes, where the mammoth itself was found, and it could not, therefore, be doubted that the mammoth lived in Europe and America with the same food and surroundings as it did in Siberia.

THE MOUNTING OF LORD ROSSE'S NEW REFLECTOR.—At the late meeting of the British Association, Lord Rosse gave a short explanation of the peculiarities of an equatorial mounting recently erected at Parsonstown, showing the points in which it differed from the ordinary type of mounting. The optical arrangements were exactly the same as in ordinary cases. The old mounting at Parsonstown, being made of wood, fell into decay, and be resolved to replace it by metal, and mount the instrument equatorially. The leading peculiarities of this mounting were, that the points of reversal were situated at the east and west, instead of at the north and south. The bearings on which the instrument turned in right ascension were smaller than in the ordinary mountings. The motions in declination and in right ascension were effected by means of screws, so that on a windy night the instrument could not run away with the observer. The tube was square. The clock was connected by means of a stretched strap of brass, and the gallery was quite unique. The counterpoise was less than usual. The only reflector of a similar size mounted equatorially was that constructed by Mr. Grubb, for the Melbourne government, but its drawback was that, just as the observer had moved it to the very best position for observation—namely, the south—it had to be reversed and every connection altered. The gallery was also worked by means of screws, so that there was no danger of the observer coming down quicker than be wished. The cage was independent of the mounting, moving on a circular rail, and with a second motion like that of a derrick crane. The mounting was only suitable for a reflecting telescope.

NEW MERCURY ASSAY.—Prof. F. W. Clarke, of the University of Cincinnati, has extended the electrolytic method of estimation, so successfully introduced of late years for assaying copper, to mercury also. According to the *Iron Age*, a solution of mercuric chloride, slightly acidulated with sulphuric acid, was placed in a platinum dish connected with the zinc pole of a six-bell Bunsen's bichromate battery. The wire from the carbon pole terminated in a thin slip of platinum foil, which dipped into the solution. At first mercurous chloride was precipitated, but this by degrees was reduced to the metallic state, so that after an hour or so there remained in the dish a clean mass of mercury, covered by a solution in which ammonia failed to produce the slightest turbidity. When this clear acid solution was poured off the mercury became covered with a thin tarnished film. This annoyance could be avoided very easily by removing the liquor with a pipette and replacing it repeatedly by clean water, care being taken not to disconnect the platinum dish from the mercury.

PULKOVA OBSERVATORY.—*Nature* says that Prof. Struve, director of the Pulkova observatory, is leaving Russia for a visit to Western Europe, for the purpose of giving directions for the construction of a new great refractor for the Pulkova observatory. The old refractor, which some time ago was one of the best in the world, is now behind those of Washington, Chicago and Gatcsbead (Mr. Newall's observatory), and the Pulkova observatory, according to the will of its founder, the Emperor Nicholas, should be maintained superior to all other observatories in that direction.

A NEW INTERPRETATION OF SCHLIEMANN'S DISCOVERIES.—An English antiquary in the last *Athenæum* suggests that the bodies found at Mycenæ, instead of being the actual form and feature of Homeric heroes, once belonged to some of the barbaric Gothic chiefs who overran Greece in the Christian era, and he brings a long array of reasons: 1. The style of ornamentation of many of the gold objects belongs to the north. 2. The layers of pebbles under and over the bodies are another northern feature. 3. The sword hilt lying across the loins, according to barbaric custom, and not on the right shoulder, as a Greek would have worn it. The absence of greaves and the enormous lengths of the swords, and the fact that one of them had a wooden sheath, are northern peculiarities. 4. The resemblance of the ornamented tombstones to the sculptured stones of Scotland. 5. The shape of the chariot wheels, identical with those sculptured in tombstones from Kivik in Sweden. 6. Obsidian arrow-heads of marked Scandinavian type. 7. Iron keys. 8. The similarity in shape of the gold crowns to the bronze diadems of north Germany. 9. The presence of crystal, not used for ornamentation until late Roman times. 10. Gold signet-rings of a degraded rather than a primitive art. The author's theory is that some Gothic chiefs, slain in the invasions, were buried here with their plundered treasures, as Alaric was buried in the Busento. Some objects would thus be Gothic, and others the plunder of conquered cities. This view accounts for the absence of coins and inscriptions. The undoubted early pottery would be the rubbish disturbed in digging the graves. The theory also accounts satisfactorily for some other anomalous facts.

THE PARIS OBSERVATORY.—The *Independent* gives the following interesting particulars: The Paris National observatory is being reorganized, something on the plan of our own Naval observatory. Leverrier has been succeed by Admiral Mouchez, of the French navy, who has distinguished himself by his coast surveys and his observations of the transit of Venus, on the Island of St. Paul. While he cannot be regarded as at all the peer of his predecessor in purely mathematical and astronomical ability, he will probably be much his superior as an organizer and manager of an establishment—qualities in which Leverrier was seriously deficient. Faye, who was nominated for the position by the Academy of Sciences, declined to be a candidate, leaving the field clear for Monchez, who was nominated by the Bureau of Longitudes. M. Loewy is associated with Monchez as sub-director. He held the same post under Delannay when he was director of the observatory, a few years ago.

OBSERVATIONS ON THE MOON.—Prof. Newcomb has just issued from the Government Press (as an appendix to the "Washington Observations") the first part of his researches upon the motion of the moon, consisting mainly of a discussion and reductions of observations of the moon made previous to 1750. He pays especial attention to a great number of star occultations observed by Heveltius, Cassini, La Hire, and others, which have been hitherto neglected, and rests his conclusions largely upon them, after showing that the observations of the very ancient eclipses, upon which so much has been made to depend, are either of doubtful authority or exactness. Probably the most striking of his results is the reduction of the so-called secular acceleration of the moon from Hansen's value, 12″.2 to 8″.8. A second part is to follow, containing his theoretical investigations of the same subject.

NEW FORMS OF FUNGI—The distinguished micologist, Dr. F. Von Thumen, reports that he has discovered two new forms of fungi which occasion considerable damage among garlic and onion crops. In certain parts of the Old Franconia district of Bavaria he has found the garlic completely destroyed by them, more especially when the weather is at all damp. The more destructive of these fungi is evidently a *Helminthosporium* and has been classed by Dr. Von Thumen as *Helminthosporium vest colosum*.

A POLAR EXPEDITION RETURNING.—Information has been received by Captain Howgate, at the Signal Office, that Captain Tyson, of the schooner *Florence*, of the Howgate Polar Expedition, had reached St. John's, N. F., a week ago. He has been absent fourteen months. All hands were reported well, but it is not announced whether they had done anything about the pole or not.

QUANTITATIVE.—G. Larsen gives the following method for separating copper and zinc by sulphuretcd hydrogen by precipitating one only. He moistens the precipitate of sulphureted hydrogen on the filter with hydrocloric acid of 1.05 specific gravity, through which sulphureted hydrogen has been previously passed. After moistening, the filter is washed with sulphureted hydrogen water.

STANLY FORESTALLED.—There is said to be a terrestrial globe in the Jesuitic library of the Lyons Lyceum, which is 170 years old, containing, in great detail, the curious system of African lakes and rivers, which the English and American travelers have lately rediscovered. The globe has created a great sensation among geographical savants and amateurs.

Mining Share Market.

Those whose business it is to watch the market continually, seem inclined to think that buyers at the inflated prices that have ruled lately, are now in a rather delicate situation, likely at any time to regret their bargains. The Comstock market has had two good tumbles this week. On Thursday last some of the quotations were. Utah, $48; Sierra Nevada, $245; Union Con., $193; Mexican, $85; Ophir, $72. Friday the same stocks were: Utah, $40; Sierra Nevada, $220; Union Con., $185; Mexican, $70; Ophir, $56. Farther south out of the range of "sympathy" the fall was not so great. By Tuesday the market had recovered a little. But on Wednesday there was a decline, Utah reaching $38; Sierra Nevada, $200; Union Con., $180; Mexican, $77; Ophir, $61. This is, we believe, in the face of good reports. Sierra Nevada is acknowledged to have excellent ore, but the people are perhaps impatient at the long delay before crosscutting. This operation may not begin for three or four weeks. The expenses of the honanza mines nearly came up to the income in September, so no dividend has been declared. The stock has held quite firm.

The outside stocks have shared in no measnre the Comstock finctuations. Bodie, notwithstanding heavy expenses, has declared another dividend, No. 3 of $2 amounting to $100,000, payahle on the 14th inst. The stock has risen to $23.50. The bullion is bearing more silver now, an indication that the fissure is very extensive, as Comstock experts well know. The Dudley Silver mining company of the same district, have listed their stock on the hoard. Despite promises of developments in many Mono mines, Bodie still holds the highest position.

The Alaska G. and S. M. Co. have erected a 10-atamp mill at their works on Barnon island, ahout 14 miles from Sitka. They have some 250 or 300 tons of ore ready to pass through the mill. The quartz, which is taken from a mountain ahout five miles from the tunnel, called Bald Knoh, will average $35 per ton; but selected quartz from the same locality will average from $1,000 to $2,000 per ton on an assay. From assays made in this city and elsewhere, it is known that the precious metal taken from Stewart's tunnel can he ohtained in quantities to justify the working of the mine.—*Astorian, Sept. 18th.*

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned

CALIFORNIA.

ALPINE.

Various Mines.—Calaveras *Citizen*, Oct. 5: The Advance mine suspended operations some timo since, with the exception of two miners who are taking out oro. The cause of tho susponsion was the lack of funds to pay tho workingmen. It is believed that work will soon be resumed with an increase of force. A contract has been let to Harkin & Gibben to sink the shaft 100 feet deeper on the Johnson lode. Cheering prospects are looked for. The Live Yaukee mine is making itself notable among the other mines in the district for its richness. The Morning Star and Laviata mines have both been reopened hy capitalists from Empiro, Nevada. Everything is heing put in first-class order at these mines; like all othor mincs in this vicinity they have only heon scratched. In fact prospecting to a greater extent than usual is going ou in the vicinity with a vim and a determination of success.

CALAVERAS.

Upper Country.—*Chronicle*, Oct. 5: Porteons' mill at Bummerville, West Point district, is running ou custom rock. At the Champion work is goiug on as usual; stoping and sinking. It is expected to have the mill running in two weeks. Hillery & Johnsou, proprietors of the extonsion of the Lone Star, have uncovered a ledgo twn and a half feet wide that prospects $60 per ton. A rich chimney has heen struck in the Water Lilly, West Point. Experts estimate that the rock will go fully $40 per ton. Lewis & Fairchild, proprietors of the Never Fail mine, near Mosquito, lately crushed ahout 30 tons of ore in Garland's mill that paid in the neighborhood of $40 a ton. Holmes, proprietor of the San Joaquin, at Mosquito, ia transferring the hoisting worka on that mine to the Alhers claim. New and powerful machinery for the San Joaquin is on the way from San Francisco. The Buffalo mine, at Bummerville, West Point district, continues to produce rich ore.

Banner.—Levels have now heen run on the pay chute a total distance of 110 feet, witbout reaching the end of it either way, the ore rich. The shaft is 190 feet deep, and has heen sunk in rich ore the entire distance holow the deepest levels. Operations are being vigorously pushed, both in the levels and shaft.

COLUSA.

Mineral Notes.—S. F. *Bulletin:* In tho Coast range there are many indications of mineral wealth. In Indian Valley township is the Buckeye Quicksilver Co's mine in successful operation, although it is temporarily at rest on account of the low price of the metal. There are a number of mineral springa in the county, the most noted of which are Cook's spring in Indian valley, and Fouta' spring in the same section. These waters are cold, hut are claimed to possess a great deal of healing power. Wilhin's springs, in Spring valley, are a network of warm and cold sulphur springs, and no douht possess great curative power.

LOS ANGELES.

Plumbago.—*Star*, Oct 1: Within the past week, Messrs. Henry Camphell, Roht. Thompson, Richard Kichline and John Davis, of this city, discovered and located an immense deposit of plumbago in the San Fernando mountains, ahout 23 miles from Los Angeles and six miles from the railroad at Andrew Station. The deposit is some 50 feet in width and of incalculahle depth, running through a mountain. It is encased in massive, solid, glass-quartz walls. Samples have heen analyzed, showing 82% of the mineral. The location of the discovery is such that a wagon road can be constructed to the railroad with hut little expense, and wood and water necessary for its purification and manufacture into the various articles for which it is adapted are found in profusion in close proximity.

Black Star.—Anaheim *Gazette:* Work temporarily suspended on account of heat. Men making air-chambers. The vein in the new shaft, which had only a width of eight inches at the start, has developed into a width of three feet. All the clay has run into coal.

Items.—The miners in Silverado are elated over the prospect of having a mill. The Blue Light company have announced that one will he in running order in three or four weeks. Hundreds of tons of known-to-be-rich ore await the mill's erection.

The Black Star Coal M. Co. have just discovered another ledge of fine coal 4½ feet wide. The force of miners will be increased on the 15th instant, or as aoon as the mine is sufficiently ventilated to permit the miners to work. The coal of this company is now in use in all the mills and distilleries in this end of the country.

MONO.

Bodie.—*Standard*, Oct. 2: The work of development seems to receive a new impetus as day succeeds day, and the confidencc of our mining fraternity both local and foreign, acquires additioual strength as depth is attained.

Mono & Cross Con.—Now down in the new shaft 59 feet. From the 37-foot level to the 56-foot level material passed through is decomposed quartz, porphyry and clay. At 58 feet encountercd a body of very hard quartz, and the indications are favorable for striking the ledge soon.

South Bodie.—At a depth of 137 feet havo oncountered a small flow of water whicb does not interfero with the workings. In sinking have passed through ledge-matter into birdseye porphyry, where the water referred to was found in the contact. The shaft will be continued to a depth of 300 or 400 feet, beforo crosscutting.

California.—Ledge at bottom nf shaft uow six feet in width and ledge matter "horned out" shows gold in considerable quantities.

Republic Con.—Now engaged sinking a shaft between the Republic and Mammoth lodes. At a distance of 100 feet drifting for the ledge will he commeuced. Assays from the Republic yield as high as $64 per ton in gold. This is a good showing—so near the grass-roots.

Nevada.—Work progressing on shaft. After passing through the ledge, hard felspatic porphyry, similar to that fouud on Bodie Bluff, is encountered, which is the first of that class of rock found after leaving the formation ou Bodie Bluff, some 3,000 feet north.

Richer.—Have commeuced to sink a winze in the tunuel. The ledgo is 4 feet wide and looks well. Have started a south drift on the ledge from the crosscut. Tbe ledge bere is 2 feet wide, of fair oro.

Rustler.—Shaft down 105 feet. Material passed through porphyry and ledge matter mixed with quartz.

Black Fox.—Work commeneed ou the new shaft heing sunk in the center of the location. This mine is situated on Queen Bee hill and adjoins the Governor Hayes on the south.

Enright.—This nine, named after John Enright who was tho locator, is being developed rapidly, witb good prospective results.

Gold Fish.—This is newly incorporated. Work has been commenced and will be prosecuted with vigoi. Every indication points to a first-class miue.

Booker.—The engine is in place, and hoisting will probahly he commenced in ten days.

True Blue.—Among the new incorporations this mine shows indications of becoming oue of the leadiug properties of tbe district.

Various Mines.—The Gildea ledge in the Bodie has been intersected. Where cut it is 2 feet wide, and will mill from $40 to $50 per ton. The ledge in the nortb drift of the Standard is 3 feet wide. The ledge at the bottom of the incline of the McClinton is 2½ feet wide, and prospects well. The Bulwer has three ledge exposures—two of them 2 feet wide. Indications are favorable that the Bodie and Bulwer vein will he struck in the Riqueza.

NEVADA.

General Outlook.—Grass Valley *Union*, Oct 4: In prcsenting the usual monthly review of the mines of Grass Valley district, we feel justified in saying that the general appearance of regular and prospecting operations continue very favorahle, and at no time in the last five or six years have our mines given more encouragement than now. It will take well into another season before some of them are sufficiently developed to class them among estahliahed mines, hut at the present they give assurance that they will gain a reputation for permanency. Those of our citizens who have not had the opportunity to visit the mining operations iu the district during the past season would he surprised if they could see the activity that is really prevailing in the numher of enterprises that are heing carried on. During the present season a number of companies have started in, and in ahout every instance upon old locations, which have hecn standing idle for years, hut which are giving results that show that they should not have heen so long held in aheyance. There can he no question as to the richness of the Grass Valley quartz mining district. It has produced millions of treasure, and yet hut few mines have heen worked to a perpendicular depth of 500 feet. Whatever development has heen made has been almost entirely hy home companies, but comparatively little outside capital having aided. It has heen claimed for this district in the past, and it can he claimed for it truthfully now that it is yet the hest gold quartz district on the Pacific coast. It is true, that with the silver mining excitements that have prevailed of late years it has heen greatly neglected, not only hy mining capitalists, hut even hy our own people. To-day Grass Valley should he only second to Virginia City, as a busy, prosperous mining district, and should it receive that attention to its mining interests that it deserves, it will yet become ao.

Monthly Review.—*Union*, Oct. 4: The Idaho has paid 110 regular dividends amounting in all to $2,487,250. Already ahout 15,000 shares out of 20,000 heing aold for a working fuud to revive the Scadden Flat mine, have heeu taken in Grass Valley, Nevada and vicinity. Ore coming from the second level west, in the Rocky Bar mine, is estimated worth over $100 per load. The Centennial dividend paid in Septemher of 50 cents per share, amounting to $1,500, will be followed hy an equal one during the current month. New York Hill rock continues of good quality, hut perhaps not quite as rich as that produced a month ago. It is the intention to thoroughly develop the Gold Hill mine in the expectation that it will regain its old time reputation. The Alaska-Bullion mine is now well opened, and it only requires the completion of the new improvements to cnahle the companies to commence the extraction of profitable ore. The prospect shafts on the Swiss-American location show a strong ledge that has heretofore given favorable returns. Bean & Ryan, the lessees of the King's Hill ledge are accumulating ore estimated at ahout $60 per load. The appearance of the Hueston Hill mine is considered favorable for the future. Messrs. Sampson & Bro. have leased tho Peabody. The old dnmps at the Allison Rauch mine, are heing turned over hy Ned Sullivan & Sons, and so far have paid them well. The last crushing of Pacific or McDouald rock ranged from $100 to $200 por load. Thirty loads on the Judd & Casey dump will avorage ahout $60 per load. Au improvement is reported in the Empiro. Night shifts will soon be put on the American. The ledge continues good. Tho Knight of Malta is to he resurrected.

Items.—Croshy Bros. and Joseph Olive, who have lately bonded the Williams ledge (Peck ravine, near Nevada City), have struck a 30-inch ledge, increasing with the depth and prospecting well. The Brunswick mine is said to have very bright prospects. The new owners of the Blue Bank's mine hope to hydraulic out $25,000 or $30,000 tho coming season. Quartz mining in the neighborhood of Washington is "looking up."

PLACER.

Pike Bell.—*Argus*, Oct. 5: The St. Patrick quartz mill, on Oct. 2d, completed a crushing of 80 tons of refuse rock from tho mine known as "Pike" Bell's claim, whicb yielded about $14 per ton. Tbis is nearly double what that kind of stuff was expected to pay. The last crushing of rock from that mine, less than two months ago, gave a return of nearly $12,000 for 45 tons.

Lincoln Coal.—Sacramento *Bee*: The Lincolu coal mine has recently chauged hands, and the new management are uow engaged in re-opening an old shaft which has heen allowed to become nearly filled up with sand and debris. It is claimed that a gravel vein of hituminous coal exists here, and that by proper management it can he worked to advantage.

PLUMAS.

National Mine.—*National*, Sept. 28: The new mill addition of teu stamps is now completed, which makes the crushing capacity 30 stamps. The mill is most complete, having all the modern and improved machinery, together with Hendy's celebrated concentrators and self-feeders. This company have lately purchased for $30,000 and consolidated with their own property, the Monitor mine adjoining, an extensive property, showing a very fine ore body. The ledge in this mine averages from four to six feet of fine pay quartz. The Plumas Co. have made extensive improvements here, including all necessary shops and outhuildings. Three tunnels open up this large country, giving every facility for easy and expeditious working of the ore. A fine large ore-house has heen huilt at the mouth of the main tunnel, with which it is counected hy track. At presont the ore is being hauled to the mill, hut we uuderstand a tramway is contemplated to connect the two mines. The Plumas mine proper, is a thriving institution. A large numher nf men are employed in the various works. The ledge as it appears on tbe various stopes showa finely, the walls heing perfectly defined. The quantity of sulphurets is remarkahle. The company are now pushing ahead rapidly a lower tunnel on a level with their mill, which is now in nearly 500 feet, giving every indication of a certainty of striking the ledge at this depth. The past two weeks a fine hody of quartz has come in, which has increased in size from 18 inches to over 4½ feet. This quartz is a fac-simile of that in the main ore hody ahove, and also carries heavy sulphurets. From the surveys of the company this tunnel is not expected to reach the main ore hody for about 150 feet yet, and it may be that the quartz now coming iu will lead to some new aud extensive development. It is hut a short distance from the mouth of this tunnel to the mill, with which it is soon intended to make connection hy tramway. The hullion shipments of this company are now quite large, and tbey will he increased hy the additional mine and mill facilities.

SHASTA.

Furnaceville.—Reading *Independent:* T. J. Sullivan, with others, has resumed work on the "Bumble Bee," or Shasta Con. claim. The "Donkey" is still working away. Lumber has heen ordered for rebuilding at the Afterthought, and affairs generally are getting shaped for husiness. Recently L. Eilera, of this district, discovered an extensive hody of graphite, which is somethiug uot common in California, and on account of its value and the large quantity of mineral in sight, the discovery is one of considerable value. As yet Mr. Eilers has done hut little work in the mine.

Copper City.—The Extra Co. shipped in September hullion valued at ahout $19,000. They have their new pans running, and are now shipping $2,000 every alternate day, and have plenty of rich ore in sight to produce five times that amount if they only had the capacity for reducing. The Potter mine is producing 40 tons of ore per day, and the chimney of rich ore is now open 140 feet in length on the ledge, and to a depth of 60 feet with an average width of 8 feet. The face of the drift each way, hoth north and south on the ledge is in excellent ore, with every indication of a continatiou of this rich chimney for many hundred feet. The Jennie June miue is situated on the north extensiou of the Potter mine, and is controlled hy James Sallee; he has run a tunnel and cut the ledge, which is 14 feet wide and is well defined. The ore shows free gold plainly, and averages $40 per ton in gold and silver. Mr. Sallee con-

Continued from page 226.

minous trees represented by locusts, honey locusts, gymnocladus, and cladrastis (even its cercis, which is hardly European, is like the Californian one mainly a shrub); no Nyssa, nor Liquidambar; no ericaceæ rising to a tree; no humelia, catalpa, sassafras, osage orange, hickory, or walnut; and as to conifers, no hemlock spruce, arbor-vitæ, taxodium, nor torreya. As compared with Northeastern Asia, Europe wants most of these same types, also the ailantus, gingko, and a goodly number of coniferous genera. I cannot point to any types tending to make up the deficiency, that is, to any not either in East North America or in Northeast Asia, or in both. Cedrus, the true cedar, which comes near to it, is only North African and Asian. I need not say that Europe has no Sequoia, and shares no special type with California.

Now the capital fact is, that many and perhaps almost all of these genera of trees were well represented in Europe throughout the later tertiary times. It had not only the same generic types, but in some cases even the same species, or what must pass as such, in the lack of recognizable distinctions between fossil remains and living analogues. Probably the European miocene forest was about as rich and various as is ours of the present day, and very like it. The glacial period came and passed, and these types have not survived there, nor returned. Hence the comparative poverty of the existing European sylva, or at least, the probable explanation of the absence of those kinds of trees which make the characteristic difference.

Why did these trees perish out of Europe but survive in America and Asia? Before we enquire how Europe lost them, it may be well to ask, how it got them. How came these American trees to be in Europe? And among the rest, how came Europe to have Sequoias, now represented only by our two big trees of California? It actually possessed two species and more; one so closely answering to the redwood of the Coast ranges, and another so very like the *Sequoia gigantea* of the Sierra Nevada, that, if such fossil twigs with leaves and cones had been exhumed in California instead of Europe, it would confidently be affirmed that we had resurrected the veritable ancestors of our two giant trees. Indeed, so it may probably be. "*Cælum non animam mutant*," etc., may be applicable even to such wide wanderings and such vast intervals of time. If the specific essence has not changed, and even if it has suffered some change, genealogical connection is to be inferred in all such cases.

That is, in these days it is taken for granted that individuals of the same species, or with a certain likeness throughout, had a single birthplace, and are descended from the same stock, no matter how widely separated they may have been either in space or time, or both. The contrary supposition may be made, and was seriously entertained by some not very long ago. It is even supposable that plants and animals originated where they now are, or where their remains are found. But this is not science; in other words it is not conformable to what we now know, and is an assertion that scientific explanation is not to be sought.

Furthermore, when species of the same genus are not found almost everywhere, they are usually grouped in one region, as are the hickories in the Atlantic States, the asters and goldenrods in North America and prevailingly on the Atlantic side, the Heaths in Western Europe and Africa. From this we are led to the inference that all species closely related to each other have had a common birthplace and origin. So that, when we find individuals of a species or of a group widely out of the range of their fellows we wonder how they got there. When we find the same species all round the hemisphere, we ask how this dispersion came to pass.

[To be Continued.]

TRAIN RECEIPTS IN CHICAGO.—The *Railway Age* says: As many as 2,475 cars of grain arrived in Chicago in one day recently. Allowing each car, with buffers and slack, the space of 32 feet in a train, this would give a continuous train of cars, not counting engines, just fifteen miles long. As nearly as heavy a movement is going on day after day some idea can be formed of the prodigious receipts at this port—mostly for lake shipments east.

THE following plank is in the platform of the Storey county Democrats: "We demand that our next Legislature so amend the 'Act to protect the rights of owners of stock shares, etc., in the mines of this State,' approved February 21, 1877, as to compel all persons in charge of any mine to permit any person who is a *bona fide* owner of stock therein, without regard to value, to visit freely all parts of the mine, whenever he shall desire."

A VALUABLE deposit of onyx has been found in Sonoma county, and it is the more valuable because it is small. Some specimens exhibited in San Francisco are pronounced superior to anything of the same kind yet discovered on this coast. The striations and shadings are remarkable for their variety and beauty, and make the onyx very suitable for ornamental purposes.

A NEW mining district, to be called the Potosi, 35 miles southeast from Kemper's, and about the same distance northeast from Winnemucca, is the latest sensation. Some of the ore is said to assay $1,000 per ton.

The Megaphone.

Mr. Edison is still at work turning out novelties of invention and discovery. We take from the *Scientific American* an engraving and description of his megaphone. In the foreground may be seen the instrument as it is used, and in the dim distance may be discerned, in the haze, the upright figure of a man, who is holding converse with the man in the foreground.

From the time of the first man until now, men have endeavored to circumvent nature so as to grasp that which the unaided faculties could never attain. We have telescopes for viewing remote objects, microscopes for making visible the minute, telephones for talking over immense distances, and now, at last, we have a megaphone, which is to the ear almost what the telescope is to the eye, or the telephone to the vocal organs.

The speaking trumpet, which, for two centuries at least, has been employed to direct

METHOD OF CONVERSING WITH EDISON'S MEGAPHONE.

sound so that it may be heard over a long distance, is much used at sea, and is often employed on land to direct vocal sounds so that they may be heard above other sounds. It is tolerably certain that the speaking trumpet is of modern origin, and that it is the invention of Samuel Moreland, 1670.

Kircher, in his *Ars Magna et Umbra*, and in his *Phonurgia*, mentions a kind of gigantic speaking trumpet, described as the horn of Alexander. According to Kircher, this horn enabled Alexander the Great to call his soldiers from a distance of 10 miles.

Prof. Edison, in his researches on sound, has made many curious experiments, one of the most interesting of which is that of conversing through a distance of one and one-half to two miles with no other apparatus than a few paper funnels. These funnels constitute the megaphone, an instrument wonderful both for its simplicity and effectiveness. The engraving represents the instrument as it stands on the balcony of Prof. Edison's laboratory. A mile and a half distant there is another instrument exactly like the one in the foreground.

The two larger funnels are six feet eight inches long, and 27½ inches in diameter at the larger end. These funnels are each provided with a flexible ear tube, the end of which is placed in the ear. The speaking trumpet in the middle does not differ materially from the ordinary ones. It is a little longer and has a larger bell mouth. With this instrument, conversation can be readily carried on through a distance of one and one-half to two miles. We have conversed and heard singing through the distance named, although both the singing and talking were in the ordinary tone of voice. A low whisper, uttered without using the speaking trumpet, is distinctly audible at 1,000 feet.

Coal Mine Explosion.

The cause of the terrible explosion in the Abercorne colliery North Wales contains at present something of a mystery. The mine seems to have been very well managed. The machinery for winding, pumping and ventilation was of the best kind and the use of safety lamps was rigidly enforced.

The colliery employed upward of 1,000 hands, of whom 373, taking their shift, went down at 11 o'clock on the morning of the day on which the explosion occurred. Twenty-one of this number came up at noon, up to which time nothing had happened to create a suspicion of danger.

At 12 P. M. a loud rumbling noise was heard, quickly followed by flames from the mouth of the pit, and a column of smoke, dust and debris ascending high in the air. Three detonations were successively heard on the surface. The frameworks and castings of the pit were thrown to a hight of 300 feet above the mouth of the shaft. The winding gear was damaged, thus destroying the only means of communication with the men in the pit.

As soon as the gearing could be repaired, working parties were sent down the shaft, and 82 men and boys, working within a few hundred yards of the shaft, were rescued; but it became evident, as attempts were made to advance into the workings, that little hope could be entertained of any life surviving.

About 400 yards from the bottom of the shaft was a stable, and here fourteen horses were found, all dead. Beyond this point the explorers could not go on account of the impurity of the air and the prevalence of choke-damp.

The volunteer explorers succeeded in bringing out eight or ten men, very much burnt; also seven dead bodies. After all hope of rescuing more of the men in the pit and while 251 were still missing, the flooding of the pit commenced.

The Engineer.

Logging Railroads.

An Eastern writer who has lately made a tour of the Wisconsin lumber regions, gives an account of the various ways the lumbermen have employed to get their logs to the mills. Some of these may be of interest to our own lumbermen. All sorts of artificial roads, constructed in all sorts of ways, have been tested on the various streams tributary to the Mississippi river. The favorite method has been to construct a road, the rails of which are round poles, which necessitate the use on the cars or trucks of concave wheels. The motive power is horse flesh; and the method is regarded both as a success and a failure, according to the man you talk with. In building such roads, such a variety of circumstances have to be taken into account that the success of one in one locality is no guarantee that it will be a like success in another. In the whole State of Wisconsin, the building of a logging railroad has not been undertaken on such a scale as the one now operated by Hazelton & Gerrish on the Muskegon river, in Michigan; consequently, hauling logs by rail in this region has not been as much of a success as those gentlemen have found it. The result of my investigations among Wisconsin operators shows, in their opinion, that where the length of the haul is one mile, or less, the cheapest way to secure the logs in summer is by the use of low-wheeled trucks, with four-inch tires. Of course, in any section where the nature of the ground is low and swampy, the road must be corduroyed; and if the track for the teams can be filled with sawdust, so much the better. Where the haul is more than a mile in length, the tramroad is the cheapest; and if it is more than four miles, and there is a sufficient quantity of lumber to justify it, the steam locomotive is to be preferred. I find many who are of the opinion that for more than a two-mile haul the locomotive is the cheapest in the end.

The experiment of using a locomotive on a wooden tramroad has been tried on the Wisconsin Central road by W. H. Blades, of Dorchester. After spending considerable money and wasting no little valuable time, he abandoned the locomotive as a failure. My opinion, is that the experiment failed because the road was not made well enough to successfully use the locomotive. In order to do so, the road-bed must be made moderately solid. In fact, the error among loggers seems to be that, for such purposes as theirs, any kind of a road will do. This is not so any more in their case than in that of our ordinary traffic railroads. Owing to the spring of the poles under the drawing weight of the locomotive, everything about the engine must be made loose jointed, and as loose joints are not conducive to the successful operation of a steam engine, experiments in that direction are likely to prove failures. Messrs. Lamb & Richardson, at Spencer, on the same line, have also been testing a locomotive somewhat differently constructed, but with, so far, indifferent success. They are now placing upon their road trucks with wheels flanged in a different manner, and hope to be more successful. The Eau Plaine Lumber Company, at Rundle's mill, is now building a four-mile railroad, using sawed ties, which are laid on the ground eight or ten feet apart. On them are laid stringers of pine timber of different sizes, flattened at both ends to eight inches. On these strings a 3 × 4 in. hardwood rail is laid, care being taken to break joints. The stringers are pinned to the ties with 1½ in. wooden pins, while the rails are spiked down with 6 in. boat spikes. An ordinary locomotive will be used, the wheels of which, as well as those of the trucks, will be flanged. This experiment is looked upon with considerable interest in this section. Had the company used a light iron T rail, I think it would have been more successful and cheaper in the end.

These tramroads, of from one to four miles haul, have been successful only where there has been great care taken in the construction of them. The route must be made as straight as possible, and great care must be exercised in laying the poles. The cost should range all the way from $225 to $300 per mile, owing to the character of the route. Experience shows that any cheaper roads have to be practically rebuilt about once in 60 days. The usual load for two horses is 1,500 feet of logs for hauls of a mile or less.

ENGINEERING PROJECTS IN AUSTRO-HUNGARY. It is said that the empire of Austria has followed the example of France and of Italy in the matter of internal improvements, the imperial Austro-Hungarian government having decided to construct a system of railroads commensurate with the needs of the country in these times. Facilities for rapid and easy transit will undoubtedly do much to break down the barriers maintained by old tribal jealousies, and bring about harmonious relations, making the empire a more and more homogeneous body politic. The Danube is to be spanned by iron bridges; Croatia and Sclavonia are to have main trunk lines traversing their entire extent; Hungary is to be connected with the older empire by a network of roads; and even the new territory of Bosnia is to be penetrated by an extension of the same system. The lines have not been decided on in all cases, there being, for instance, three distinct projects for communication between Buda, Pesth and Belgrade, but the policy

of exteoding the railroad system has been definitely adopted, and will be carried out with energy and dispatch.

Russian Railway. — Engineer John McFethries, for eleven years master mechanic of the Kursk, Charkoff and Azof railroad in Russia, has returned to Springfield, Mass., and gives interesting facts about Russian railroading. This road is o single-track concern, 500 miles long, runoing from Kursk to the port of Tagonrog on the Azof sea. The gaugo is five feet, with an equipment of 225 passenger and 4,500 freight cars, 200 engines and 4 locomotive ond repair shops, with 1,500 to 2,000 employes, according to the season. Tho coaches, of continental manufactore, are peculiar in pottern, opening at the ends with a middle aisle as here, but only 34 feet long, and instead of having four or six-wheeled trucks, three single wheels on each side of tho car, are attached directly to the car string-pieces, equi-distant, and not connected with each other. Four wheels sutlico for a freight car. American coaches are almost unknown, only one car, a Pullman, from England, having been run over the road on an exhibition trip. But palace cars are liked by the authorities, and Mr. McFethries thinks they will soon be in use, though tho royal family may for a time monopolize them.

Mr. Eads and His Jetties.—In a late letter to a member of Congress, Captain Eads makes the following statements concerning the present condition of these great works of improvement: "The jetty channel is now almost as good as the entrance to New York harbor. Larger ships and steamers visit the port of New Orleans than ever before. Ocean freights have been so greatly lowered in consequence that the saving on cotton alone from the port of New Orleans, the past season, was over $1,600,000. Every intelligent man in Missouri knows that a revolution has been wrought in the grain trade as a result of this deep water. As the channel deepens, and commerce adapts itself to these new conditions, the hencfits to the producers of Missouri will be still more extensively enjoyed. The permanent improvement of the mouth of the Mississippi operates as a regulator of transportation charges, and thus adds to the value of every hushel of grain grown for export to Europe, or for consumption in the Atlantic States, and it also cheapens to the farmer all of his merchandise and other supplies brought from the East."

The Railroad in Literature.—The *Railway World* says: Auerbach, who writes in romance the philosophy of the modern life of Germany, has recently been completing a series of his earlier sketches by adding sequels or continuatioos. These new stories take up the same people and scenes after a lapse of 30 years, and present them as they are at present. In seeking for a fitting title, Auerbach says he would find the fullest expression of his theme in the name "The Village on the Railroad." All the modifications and developments which so strikingly distinguish the two periods might well be traced to its influence. The railroad has cut through hill and valley; it has removed ancient harriers; dissolved at a touch the effect of old isolations, and harmonized all conflicting customs. During the period, the domestic and social economy of village life has been thoroughly metamorphosed, and the work must he ascribed to the effects of the railway and its attending free emigration.

More Tunneling at Hell Gate.—The work of sinking a shaft and sideward tunneling under the river bottom at Hell Gate, has been recommenced this time on Flood Rock, a small island, and the worst obstruction in that channel. It had been commenced once before, but abandoned, and work was resumed in the beginning of July, when the pumps were started for the purpose of removing the water that had leaked from ahove into the shaft and the submarine galleries. The shaft is 50 feet deep, and the galleries, which run from it in many directions, are now about 600 feet long. After pumping out the water, the work hegan of cleaning out the debris, getting the steam-pipes and drilling-machines in order, and propping the sides of the galleries where they were cracked or otherwise in danger of falling. Drilling and hlasting has now been resumed.

Northern Pacific Extension.—A reporter connected with the St. Paul *Pioneer-Press* recently interviewed President Wright, when he gave the following hrief statement of what was expected to be done: A proposition is in preparation which he expects to lay hefore the stockholders at the annual meeting of the company, on the 25th of September, in New York, with reference to the immediate commencement of work west of the Missouri river, at Bismarck, with the intent that the road for the entire distance to the Yellowstone, 205 miles, shall be completed and ready for operation in one year from next spring. The company will soon advertise for hids for supplying the ties and timbers, which will be got out the coming winter.

The Delaware Ship Canal.—United States engineers are now at work, under the authority given hy an appropriation of $15,000 granted at the last session of Congress, in surveying routes for a proposed ship canal across the eastern shore peninsula. They will make a survey of all the routes availahle for the purposes of a ship canal, beginning with the lowest and working up to the Sassafras river, which is the highest point that will he reached.

Useful Information.

How Russia Sheet Iron is Made.

There is a controversy going on in Eastern papers as to tho comparative merits of Russia sheet iron and the American imitation of it. Into the merits of the controversy we do not propose to enter, but it has brought out in the *Engineering and Mining Journal* an interesting description of how the Russia iron sheets are made. Theso polished sheets are manufactured from charcoal iron, produced in finery fires and hrought into tho form of blooms about one inch thick. Theso blooms are heated to cherry heat and rolled into leaves. Each of theso leaves is cut into pieces corresponding to the weight of tho sheets which are to be manufactured, and these pieces are piled upon one another and rolled together until the desired degree of thiuness is attained. Thus the black sheets are manufactured. To transform theso into polished sheets, a certain number at a time are heated to red heat and piled one upon another, a black impalpable powder, which is simply pulverized charcoal, being sprinkled hetween each two sheets. The bottom and the cover of each packet of sheets thus piled for polishing are formed by two sheets of greater thickness. This packet is then hammered, for tho purpose of reducing tho sheets still further in thickuess, under a hammer, the head of which weighs from 1,000 to 1,100 kilograms (say 2,200 to 2,400 pounds). For giving polish and luster, the sheets, now almost cold, are brought under a second hammer with a large face, rounded at the edges and of the same weight.

Finally, they are allowed to cool completely, and are theu clipped and classified into three classes, according to the perfection of their polish. The sheets of the first class ought to be like a mirror, without a spot upon their surface. The action of charcoal projected upou the red-hot surfaces, and inclosed hetween them without access of air, may he easily understood. It cements, and thus enables them to take a high polish, while rendering them at the same time less liable to rust. This cementation once having taken place, the sheet should not afterward be returned to the heating furnace.

Estimation of Mineral Oil or Paraffine Wax in Mixture with other Oils or Fats.—Dr. William Thomson says that mixed oils are now often used for lubricating purposes, and a common mixture, composed of mineral oil with some animal, vegetable, or fish oils, was now extensively used, and it was an important point to be ahle hy analysis to determine the amount of mineral oil which such mixture contained, and as he could find no published process to effect this, he devised, after much work, the following, which he found by repeated tests to give very accurate results: He boiled some of the sample with an alcoholic solution of caustic soda, which converted all the animal, vegetable, or fish oils into soap. This was then mixed with sand, and heated and washed with petroleum spirit, distilled at a temperature under 190° Fah. This dissolves out the mineral oil, leaving the soap insoluhle. The spirit is now distilled off from the spirit solution of mineral oil, at a temperature not exceeding 220° Fah., and the residue of mineral oil weighed and calculated on the weight of the original mixed oil taken.

The Office of the Liver.—As everyone knows, the liver is a large organ; it performs duties the importance of which to the health and happiness of mankind can hardly be over-rated. Yet up to the year 1857 medical men were in absolute ignorance of one-half of what the liver does. They knew that it secreted hile; it was reserved for Bernard to discover another and no less important function hitherto unknown. It is certain, however, that it does other work little, if at all, inferior in importance to the formation of biliary matters, and quite as necessary to the maintenance of health. Its power of making and storing up for a time within its cells a material resembling starch, constitutes, without doubt, one of its most important functions. This no person will for a moment douht who takes the trouhle of ascertaining, hy experiment, the immense increase or diminution in bulk which the liver may he made to undergo in the space of a few days hy such changes of diet as increase or diminish the amount of this starch-like material in its tissues.

Test for Good Petroleum.—*Stowel's Petroleum Reporter* gives the following requisites of good petroleum, from the report of Prof. T. Lawrence Smith, as Centennial Judge: 1. The color should he white or light yellow, with hlue reflection; clear yellow indicates imperfect purification or adulteration with inferior oil. 2. The odor should be faint and not disagreeahle; The specific gravity at 60° Fah. ought not to he below 0.795, nor above 0.84. 3 When mixed with an equal volume sulphuric acid, of the density of 1.53, the color ought not to hecome darker, hut, on the contrary, lighter. A petroleum that satisfies all these conditions, and possesses the proper flashing point may be set down as a pure and safe article. Too much care cannot be exercised in examining this oil for household use. In Paine, Ablett & Co's exhibit at the present Pittshurg exposition are samples of crude petroleum from California.

Libel on American Hams.—On the strength of statements by Prof. Heschl, of the Vienna University, that ouo out of every fivo or ten American hams is infected with trichina, an attempt has been made by the Austrian government to prohibit tho importation of American hams and sausages. Tho United States Consul-General at Vienna called upon the professor to authenticate his statements. He was compelled to admit that he had no personal knowledge on the subject; that his statements were based on German reports of 1874, and that he had never seen an American ham. He was then given some by the Consul and he pronounced them good and free from any sign of trichina.

Mustard Seed Oil.—Foreign journals state that since the manufacture of allyl-sulphocyanide, or artificial oil of mustard, has been brought to its present state of perfectiou, the distillation of the genuine oil from the mustard seeds can hardly be remuneratively undertaken. It is true that when an attempt was made to introduce the artificial oil into commerce under its real name it did not find a large sale, but when vended under the name of oil of mustard it obtained ready acceptance. This imposition is certaioly harmless as any form of imposition can be, for it seems that the natural and artificial oils are identical, not only in chemical properties, but, what is of more importance, in physiological action.

Elephantine.—Nine feet ten inches at the shoulder was the highest elephant Mr. Sanderson, an expert in such affairs, ever measured. A thoroughbred elephant is worth $10,000 or more. In 1835 the price of elephauts was $225 a head; now none can be had for less than $750, and tuskers of any pretension are held at from $4,000 to $7,500. At 25 years the elephant is full-grown, and it will live from 80 to 120, or even 150 years. The Government load is 1,640 pounds, exclusive of chains and attendants, and the daily ration is 800 pounds of fodder.

Blue Manganese Color.—The *Iron Age* translates from a Freuch authority a method for making a fine blue manganese color by heating in an oxidizing atmosphere two to three parts of silica or kaoline, eight parts of nitrate of baryta and three parts of oxide of manganese. He gives also a blue chrome color for pottery, which is obtained by heating violently with an access of air, a mixture of 15 parts of boracic acid, 15 parts of alumina, 20 of carhonate of magnesia and two of chromate of baryta.

A Rustic Hygrometer.—A correspondent of *La Nature* describes an hygrometer which he found in the house of a peasant up in the mountains. It consists of a thin branch of pine in the form of a cross, attached hy two nails, one at the point of crossing, another on one arm above. At the extremity of one horizontal arm is a kind of scale, on which are inscribed (coming upward) *pluie, beau, tres-chaud* (that is, rain, fine, very hot). The pine hranch was not depived of its bark. It was about three or four millimeters diameter.

Good Health.

The Hygiene of Schoolhouses.

In the course of an article on this important subject, a writer in the New York *Independent* makes the following remarks: Great risks and great exposures to the hody are involved in sending a child to school. It may mean merely such mind work as is too much of a tax upon the hrain and nervous system. It often involves sitting in constrained positions too long, too close confinement in ill-ventilated or ill-heated rooms, and other experiences inimical to vigorous growth. A recent book says the first right of a child at school is to feel happy. One element in this is left out if the conditions are not such as favor his good health. Indisposition is a word of douhle meaning. That of the mind and temper are affected by that of the body.

There are most cogent reasons why children at school should he so provided for as that all their surroundings tend to a comfortable physical condition. Simon, speaking of artisans, says "that it is their right that whatever work their employer assembles them to do should, as far as is in his power, be divested of all unhealthy circumstances." It is a poor charity, and a poor economy, too, for the State to prescnt to all its children a free-school system, if the perils of the school-room are excessive.

No school should commence without a thorough knowledge on the part of its trustees as to the adequacy of the huilding, its desks, its heating and other apparatus, its general fitness for the conduct of the work purposed to he done in it. We wish the parents of the children would just now form themselves iuto a committee of the whole, and wait upon each hoard and find out just what they know as to sanitary inspection.

The room and huilding must have excellent janitorship, so that it can he well dusted, cleansed and aired in the hours of its emptiness. How imperfectly is this work done in most schools. There is poor housekeepiug, and that always makes trouhle.

Have the boys and girls fitted to their respective desks; not only with a view to convenience, but size. Often the blackboards are so located thot the child must face a glare of light. Ofteo the desks are so close to them that they caonot adjust distance to capacity of vision. Virchow, Loriug, Aguew, and others have well pointed out some of these defects.

Laws of postnre, hoth in sittiog and standiog, are greatly overlooked in schools, aud slight spioal deflections from the natural line give future aid to ouo-sidedness. Browo-Sequard has noted and explained how the use of one side too much and the other too little often disturbs bilateral sensibility and leads to nervous trouble,

Dr. Sequin read an interesting essay on "Nervous Diseases as Fostered by School Life" before the last National Medical Association, and claims that physieal considerations must enter far more largely into our system of instruction. Anemometers and thermometers can now tell us much as to air currents and the heat and degree of moisture of the air, while chemistry has ready aids to show us whether it is contaminated. Pale faces and puny forms and the tired look of tho homeward group sometimes make us stand aghast when they tell us: "This is education." Ten minutes of calisthenics in a close room or an occasional antic of the gymnast will not recover the unnecessary wear and tear to which our children are too often subjected, because of unavoidable conditions in many of our puhlic and some of our private schools. We ask all parents, all school-boards, and all teachers to put on their thinking-caps at once, and keep them on all this term, in the school-health interests of the boys and girls.

Life Studies.—A writer in an English magazine studies from birth to death the march of an English generation through life, basing his remarks on the annual report of the Registrar General. The author singles out, in imagination, a generation of one million souls, and finds that of these more than one-fourth die before they reach five years of age. During the next five years the deaths number less than one-seventh of those in the first quinquennium. From ten to fifteen, the average mortality is lower than at any other period. From fifteen to twenty the uumber of deaths incease again, especially among women. At this period, the influence of dangerous occupatious hegins to be seen in the death rate. Fully eight times as many men as women die violent deaths. The number of such deaths contiuues to rise from twenty to twenty-five, and keeps high for at least twenty years. Cousumption is prevalent and fatal from twenty to forty-five, and is responsible for nearly half the deaths. From thirty-five to forty-five the effects of wear and tear hegin to appear, and many persons succumh to diseases of the important internal organs. By fifty-five the imagined million has dwindled down to less than one-half, or 421,115. After this the death-rate increases more rapidly. At seventy-five there remain 161,124, and at eighty-five 38,565. Only 202 reach the age of one hundred. At fifty-three the numher of men and women surviving is about equal, but from fifty-five onward the women exceed the men.

Frauds in Graham Flour.—The St. Louis *Trade-Journal* calls attention to the fact that graham flour is rapidly coming to be as much an article of suspicion as ground coffee or spices, or any of the thousand and one adulterations that are daily practiced. The commonest form in which graham flour is seen is that made from a medium or poor class wheat, and while not properly adulteration, it may he characterized as swindling of the meanest kind, for the reason that the product is largely used by dyspeptics, and others in imperfect health. Graham flour, properly made, is nearly as costly an article as holted flour ground from the same wheat, and, therefore, when you are offered graham at much than the hest bolted flour, you are being victimized—it is either adulterated or it is made from inferior wheat. A common form of adulteration that is practiced by at least one retail flour dealer in this city, is to take a harrel of flour costing ahout $5, add to it about 60 lbs of bran, 28 pounds middlings, and the same quantity of corn meal. The result of the mixture is 306 pounds of stuff costing about $6.45, or a fraction over 2 cents a pound; while graham flour, made from the best wheat, cannot be sold now at less than 3½ to 4 cents a pound. And yet this vile stuff is heing swallowed by people in search of better health, when they would do ahout as well on a diet of hot white hiscuit.

Cure for Hydrophobia. — This disease is of exceeding rare occurrence on this coast, but it is well to know remedies. Mr. J. Y. Wilkinson, of Chester Springs, Chester county, sends the Philadelphia *Record* a cure for hydrophohia, which he says has been successfully tried for thirty years. It is the discovery of a farmer named Fry, living near Allentown. This is the treatment: The patient is to be kept free from excitement of every sort, especially from that caused hy the visits of sympathizing friends. Take one ounce of elecampane root, powdered; one tahlespoonful of madder and one quart of new milk, and boil them all together slowly (in a water bath, if possihle) until reduced to a pint. The dose is one wine glassful once a day for three days, then intermit three days, then repeat and intermit again, and again repeat. That is, nine wine glassfuls are taken in all and there are three intermissions.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—California Mining District, La Plata County, Colorado; The Mines and the Courts, 225. The Gauntlet for California Petroleum; Mines and works of Almaden, 232. Artesian Wells—No. I, 233. Patents and Inventions, 236.

ILLUSTRATIONS.—Geological Section, N. S.,—Through La Plata Mountains—Looking West; Continuation of Section South—Showing Coal Measures, 225. Method of Conversing with Edison's Megaphone, 230. Artesian Wells in San Francisco, 233.

MINING SUMMARY from the various counties of California and Nevada, 229-236.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 228-229.

NEW IN BRIEF on 237 and other pages.

CORRESPONDENCE.—Eureka Mine, Fresno Co. Yosemite Rambings, 226.

MECHANICAL PROGRESS.—Bar Iron Direct from the Ore; An English Tribute to American Inventors; Exports of American Windmills; Bessemer Gains a Point on Siemens; An Improvement in Soldering Irons; Mechanical Piracy; Heating Another City by Steam; French Mintage since 1795; Carbon Bronze; Luminous Watch Dials; An Architect not a Mechanic, 227.

SCIENTIFIC PROGRESS.—How the Siberian Mammoths were Entrapped; The Mounting of Lord Rosse's New Reflector; New Mercury Assay; Pulkova Observatory; A New Interpretation of Schliemann's Discoveries; The Paris Observatory; Observations on the Moon; New Forms of Fungi; A Polar Expedition Returning; Quantitative; Stanley Forestalled, 227.

THE ENGINEER.—Logging Railroads; Engineering Projects in Austro-Hungary, 230. Russian Railway; Mr. Eads and His Jetties; The Railroad in Literature; More Tunneling at Hell Gate; Northern Pacific Extension; The Delaware Ship Canal, 231.

USEFUL INFORMATION.—How Russia Sheet Iron is Made; Estimation of Mineral Oil or Paraffine Wax in Mixture with other Oils or Fats; The Office of the Liver; Test for Good Petroleum; Libel on American Hams; Mustard Seed Oil; Elephantine; Blue Manganese Color; A Rustic Hygrometer, 231.

GOOD HEALTH.—The Hygiene of Schoolhouses; Life Studies; Frauds in Graham Flour; Cure for Hydrophobia, 231.

MISCELLANEOUS—Utilization of Bittern on the Pacific Coast; The Atlantic and Pacific Forests.—No. 6, 226. The Megaphone; Coal Mine Explosion, 230.

NEW ADVERTISEMENTS.

Berry and Place, Machinery and Supplies, Treadwell's old stand, Market street, S. F.; H. W. Johns' Patent Asbestos Materials, Fred. M. Patrick, Agent, S. F.; Caution to Hydraulic Miners, Henry C. Perkins, North Bloomfield, Nevada County, Cal.; Assessment Notice—New Basel Gold Mining Co., D. F. LeGaye, Sec'y, S. F.; Delinquent Notice—Keystone Quartz Mining Co., Louis Vesarin, Sec'y, S. F.

The Week.

While the stock market is exhibiting a very uncomfortably nervousness, those who are directly engaged in mining operations feel cheerful in their healthful exercise. It is said that the prospects of Nevada City, that mining center, are better than they have been for 15 years. A reaction from the silver fever is hinted at, suggested by the increasing tendency to try gold quartz claims again. The working of quartz claims requires very strict economy, and it is one of the most hopeful signs that men are willing now to plan carefully and bring expenses to the very lowest pin. The Murchie mine, Nevada county, has just been planuing some economical measures which are to save it $54 per day. This matter of strict economy is one that "practical," burrying men are inclined to laugh at. Scientific men have deplored the terrible waste shown on the ore dumps of Pacific coast mines, just as in the wornout acres of agricultural land. They have said that our wastefulness is a sin against our children's children. This it will prove in its effects to he. Economy will he enforced sooner or later by natural laws, and he is happiest who is not dragged down to it hy the ear, hut who makes it the choice of a calm aud temperate judgment.

Three car loads of Black Star coal per week are being shipped from Anaheim to Los Angeles.

The Gauntlet for California Petroleum.

The Philadelphia *Business Advocate* of Sept. 26th, throws down the gauntlet for our California oil men. It says:

"Announcements of petroleum discoveries in other regions than our own have been constantly occurring, and in each case the new region was advertised as a rival to Pennsylvauis. Yet our petroleum still commands all the markets of the commercial world, and is likely to continue so to do. The reason is to be found in the enormous amount of capital invested in the production, refining and handling of the Penusylvania article. Other oils may be as good, hut the owners lack the *capital, the talent, the enterprise and the machinery.* Moreover, although petroleum is found in many places, it is nowhere so abundant as in Peunsylvania. In the extent of the oil region and its productiveness, our district is phenomenal."

In the Press of Sept. 14th, there were given some of the opiuions of Mr. Edward Maden, a petroleum expert, on the outlook of this industry on our own coast. He admitted that some of our oils were inferior to Pennsylvania oils in lighting qualities, but admitted that the same were far superior for purposes of lubrication. A fair comparison of our wells with those of Pennsylvania cannot he made, until the former have been driven deeper. Nevertheless, Mr. Maden announced that a petroleum refinery would soon be erected in San Francisco, and that, notwithstanding the reasonable rates charged for Pennsylvania oils, California would compete with that State in our own and in some export markets.

Pennsylvania may have more oil than California, and oil that may be for some purposes better than ours. Neither of these assertions have yet beeu established as a fact. But it is safe to say that we do not lack "*capital,*" "*talent*" and "*enterprise.*" And the quiet workings of these among us may soon deal some sore wounds to the pockets of those talented and enterprising capitalists of Pennsylvania, who, it may be commented, have before now cast furtive glaucos towards California.

Just what the Los Augeles and San Francisco companies are doing now, we think is not generally known. The latest reports at hand from Ventura county, give merely the general condition and prospects of some of the wells. One of these wells is down 810 feet, another 820, others, 1,400, 1,000 and 500. And the words "fine showing," "good prospects" and "splendid outlook," are of as frequent occurreuce as in correspondence from quartz veins and rich gold placers. May the oil men prosper and may our Eastern sister fiud a rival.

Sanderson Bro's & Co's Steel.—Mr. H. D. Morris, 417 Market street, is now established as permanent agent of the famous Sanderson hard and cast steel. It is designed to carry here a full and complete stock of all the various grades of steel required in this market, embracing a full line of squares, flats, octagons and rounds. This widely known hrand of cast steel, although now manufactured in this country, at Syracuse, N. Y., is identical in every particular with that made for ovcr half a century by Sanderson Bro's & Co., of Sheffield, England. The steel is made from converted Swedish iron. The pit making, steel-mixing, ingot-examining and assorting being done by skilled men from the Sheffield house—insures a reproduction in America of the standard quality and temper for which this hrand is celebrated. The founders of the Sheffield house of Sanderson Bro's & Co. were the pioneers of the American trade, and were conspicuous among the earliest manufacturers of cast steel, after the date of the invention in 1776. They are also the first to transfer the mauufacture of English steel to America. The new American company has acquired the right to use the name, trade marks, and good will, and manufacture the same qualities of steel as the Sheffield house. The steel manufacture is under the charge of a responsible steel maker, whose scientific education, and careful practical training at the Sheffield works, thoroughly qualifies him to produce the best quality Sanderson steel. As Mr. Morris keeps the different brands in stock, at the address given above, those in want of this well known article can procure it directly from him.

Death of David D. Colton.—General D. D. Colton, Vice-President of the Southern Pacific R. R., Financial Director of the Central Pacific R. R., and President of the Occidental and Oriental Steamship company, died at his residence in this city, on Weduesday night. General Colton was an old Californian, well known in early days from his connection with mining enterprises, and latterly, as one of the directors of great railroad corporations. He was for some years sheriff of Siskiyou, and for several years was a miner of that county. He estahlished the hasis of his large fortune by his interests in the Rocky mountain coal, Amador gold mining company and other mining ventures, being known, however, as a legitimate miner, and not a stock operator. He became interested in the Pacific system of railways in 1871, and has since occupied a promiuent position in the directorate. He has always manifested great interest in scientific progress, and has been President of the Board of Trustees of the California Academy of Sciences for the past four years. General Colton was a genial, pleasant man, universally liked and respected, and his early taking off is a great loss to the community.

Mines and Works of Almaden.—No. 4.

[Translated for the Press from "Annales des Mines."]

III.—Eruptive Rocks.

One sees amongst the silurian rocks, and above all the devonian, in the neighborhood of Almaden eruptive rocks of very different ages. The granite which covers great spaces in the southern part of the Sierra Morena, and constitutes the important mass of Los Pedroches about 15 to 20 kilometers to the south of Almaden appears as little islets to the northwest of Chillon, but it is not to he found in the region of the mines and does not appear to have any relation to the deposits of mercury.

It is otherwise with a series of rocks, having a very variable external character, belonging to the family of melaphyres, which is frequently seen in the neighborhood of Almaden, principally upon flanks of Chillon and Puerto del Ciervo, at Almadenejos and at Guadalperal. We believe we should describe with some details the rocks of this nature which one meets at Chillon.*

(a) Melaphyre [Augite Porphyry] Reddish Violet.

This is seen in the blocks which teem upon the banks of the river Chillon. The rock is of a brownish color, with deeper colored streaks running into violet. One distinguishes there some white amygdaloids. Under the microscope one can see that they possess a flowing texture, very pronounced in some places. It is an amygdaloide, containing many ferruginous grains. The paste is amorphous, a considerable number of very small microlites are visible, some of them belongiug to the superior felspars, and the rest being black grains, probably titaniferous iron, more or less changed into limonite. The bubbles with which the paste is snotted are filled very abundantly with quartz or calcite. These two substances are not uniformly distributed; some sections do not show anything but quartz, in others calcite predominates. With a high magnifying power, the grains of quartz present a more or less rounded hexagonal form; they consist in the center of quartz, properly speaking, and then of a zone of green amorphous substance, and upon the borders of chalcedony. These grains of quartz contain a great number of bubhles with mobile contents.† We have not been able to separate the elements of this rock, which is, by the way, sensibly altered; we have, therefore, contented ourselves with analyzing it as a whole, and we have fouud:

Carbonic acid	4.06
Water	0.74
Silica	55.00
Alumina	13.20
Oxide of iron	11 46
Lime	8.00
Magnesia	1.00
Soda	4.86
Potash	0.80
Total	00.12

(b) Melaphyre, Greenish Black.

Found in the same locality as the prceding. This rock is traversed by veius of serpentine; it is less hard than the red varicty. Under the microscope one sees that it is composed of an amorphous material, with a not very pronounced fluidity, marked with ferruginous granules; this paste contains some felspathic microlites. Numerous amygdaloids are seen, frequently filled with calcite, at other times with quartz, or with little bluish-white crystals, diminishing towards the end, analagous to certain serpentiues or talcose suhstances. The rock contains, likewise, calcite as yellow flakes, very probahly colored by a little titauic acid. We have found for this rock the following composition:

Carbonic acid	3.42
Watar	5.58
Silica	45.00
Alumina	16.67
Oxide of iron	10.33
Lime	8.46
Magnesia	6.45
Soda	3.28
Potassa	0.53
Total	99.72

This rock appears from its position, and the ensemble of its characteristics, to be the same as the preceding, but at a more advanced degree of alteration.

(c) Melaphyre Gray.

This is at the ancient excavations made near Chillon, excavations in which a little native mercury was found in contact with this rock. One cannot distinguish with the lens anything but a uniform gray paste with some reddish granulations. The microscope reveals, but in a less degree, the characteristics of varieties *a* and *b*; the rock proves to he composed for the most part of an amorphous paste, with some indications of a flowing structure, it contains amygdaloids composed mostly of calcite, sometimes of quartz. Numerous ferruginous grains are visihle changed into limouite. Analysis has given us:

Carbonic acid	2.05
Water	13.28
Silica	43.33
Alumina	18.10
Oxide of iron	8.53
Lime	10.33
Magnesia	3.33
Soda	.70
Potash	traces
Total	90.65

d. Finally a last rock, which seems to us to belong to the same category, although at a degree of decomposition very advanced. It is found at Almaden in contact with the cinnabar. The rock is white and friable; it has given us the following composition:

Carbonic acid	4.05
Water	7.35
Silica	57.50
Alumina	22.83
Oxide of iron	4.67
Lime	2.00
Magnesia	1.00
Soda	.70
Potassa	traces
Total	100.10

We should add that this rock is less and less altered as one leaves the deposits of Almaden, changes in going towards Chillon, beyond this latter locality, towards tbe west, into veritable red or brown jasper.

Taking all of these characteristics into account, one is necessarily led to place these melaphyric rocks of Chillon in the same class as those rocks of the same nature which, in the Palatina for example, and in the Vosges have erupted at the permian epoch, and traverse the beds of the carboniferous strata.*

The presence in the region of Almaden of diorite, which we know oftcn accompanies melaphyre, makes this view the stronger. The diorite shows itself in hlocks near the road from Almaden to Chillon, and in considerable masses at some kilometers to the north of Almaden and Guadalperal. Through the lens we distinguish only scales of felspar; the rock is green and very hard. Under the microscope one recognizes at once, long crystals of a triclinic felspar, with many striations, and of a dull color. The whole of its optical character proves that this felspar is labradorite. It is traversed by a great number of fissures, filled with a granulous amorphous material which penctrates all the rock. Near these crystals one sees two products of alteration: a white chloritic mass, and a yellow material formed of a mixture of chlorite and carbonate of lime; lastly, black points quite numerous, probably of titaniferous iron more or less decomposed. Some of these sections filled with chlorite permit the recognition of the crystalline form of pyroxine; the yellow matter seems originally to have been olivine, although it is difficult to pronouuce upon this. Analysis has given us:

Carbonic acid	3.92
Water	3.08
Silica	43.63
Alumina	18.66
Oxide of iron	10.20
Lime	13.70
Magnesia	3.68
Soda	2.13
Potash	.30
Total	90.44

In spite of the attraction of the rock, and the impossibility of separating the felspar, these figures, owing to the prodominance of this last species, approaching the composition of labradorite, confirm the results of the microscopic analysis.

A melaphyre very analagons to the varietv, *c*, just described, containing, besides, frequently amygdules or little crystals of ferruginous dark green chlorite, and which has somctimes been wrongly confounded with the breccia previously described under the name of *frailesca*, encloses between Almaden and Almadenejos little veins and little spots of cinnabar. These traces were the object of researches at the time of the Romans, as is proved by the coins of Vespasian, which have beeu found in some of the galleries.

The disposition of these traces show that the ore is very irregularly dissiminated in this rock. The same species is found at Guadalperal, where it passes entirely iuto a melaphyre resembling the variety, *c*, of Chillon. We shall return hereafter to these analogies in speaking of the time of the advent of the mercury of Almaden.

One would expect to find the schistes more or less metamorphosed in contact with these eruptive rocks; this does not seem ever to be the case; one does not see any derangement of the stratification in their neighhorhood, they hardly appear above the soil, which they do not derange in appearance, and give reason for the belief that they were forced to the surface without any violent concussion.

We will mention a series of rocks belonging, according to M. de Prado, to the family of trachitic, porphyry, which one meets at Montejicar, to the south of the village of Gargantiel, hut not seeming to be related to the mercurial lodes. The mass of these rocks is a felspathic paste, containing bronze colored mica and little crystals of red felspar, and perforated by a great number of cavities which are lined with little crystals of quartz.

*See. *Sur le parphyre amygdaloide d' Oberstein*, par M. Delesse *Annales des Mines*) 4th series *t. XVI.*, p. 561, etc.

[To be continued.]

*M. M. Fouque and Michel Levy have examined these rocks with the microscope.

†According to M. M. Levy, this melaphyre is identical with certain varieties of Petite-Fosse, near Remiremont (Vosges), belonging to the upper permian.

Asbestos Not on Fire.—At 2:45 a. m., Oct. 6th, flames were discovered issuing from the Asbestos roofing warehouse of H. W. Johns, No. 5 First street, San Francisco. The Department were promptly on hand, and after a sharp fight subdued the fire, but not until it had spread through several adjoining business places. The Ashestos warehouse was gutted. This fire was probably started in a lot of paints, oils, etc., stored in the huilding, and cannot he used as an argument against the effectiveness of asbestos ware in resisting fire. The company have a complete duplicate stock on hand, and the fire will not check the business, which will be carried on as usual at No. 5 First street, S. F.

Artesian Wells.—No. 1.

No one need be told that the subject of artesian wells is at present an interesting one. An artesian fever is spreading over the entire coast. We believe it started with San Francisco trying to reduce her expenses. It has spread throughout California. Some citizens of Winnemucca, Nevada, have clubbed together to pay the expenses of a trial well, which, if successful, will, to use the expression which is epidemic with the artesian fever and spreads wherever it does, "make the desert blossom as the rose," whereupon the citizens of Winnemucca will avail themselves of the Desert Land act. Arizona has caught the fever. Montana is just getting it and her Press is beginning exhortation to artesian efforts. And so it goes. Thus it happens that everyone is alert to any item or article connected with the subject of artesian wells. People are asking how to bore wells, how much it will cost, how much water they can get, and what kind of water if they get it. And on the track of these practical water-seekers there hovers a troop of scientific scavengers, who with intense curiosity bore the borers with: How deep did you go? What strata did you pass through? Did you strike any tree? Give me a piece of the mud? It is with a view to satisfying in some imperfect measure all of these inquiries, that this series of articles is undertaken. And imperfect though it must be, it cannot fail to prove of some little entertainment.

For reason we will follow a very unscientific course. We will take up first the wells of San Francisco, which will occupy the first and second articles and perhaps more. Then we shall consider wells in other parts of this State and in other States. Then we shall consider the subject of artesian wells more generally, giving, if possible, cuts of the tools used, outlines of methods, and information in regard to estimating costs, etc.

Underground San Francisco.

There have, perhaps, been bored in San Francisco upwards of 500 artesian wells. We know of only about 90. Of some of these we have none of the data and of very few are there clear and full accounts either of depths or of strata passed through. As an illustration of the difficulty met with in finding out the real depths of the wells, it may be stated that the well on the Plaza, No. 51, on Figs. 1 and 2, was reported first at 400 feet. A well-borer finally changed this to the neighborhood of 230; still another well-borer altered the figure again to 93, which, on examining the profiles, turns out to be the most probable depth. Where depth is so freely dealt with, it might be expected that strata passed through would be carelessly recorded. That this is the case will appear when we present our data, which we will give in full just as we got them rather than attempt at present to reduce them to system.

Our data have been furnished us principally by Mr. Patrick Delaney, of 764½ Howard street, San Francisco. Mr. Delaney is a pioneer well-borer and has had great experience with San Francisco artesian wells. Very complete and intelligible information has been gained from Messrs. Stevens and Wilder, of Folsom and Eleventh streets, San Francisco. We shall have occasion to speak further of our informants.

In several of the wells wood and leaves have been struck. In others gold has been met with, both in quartz, gravel, and in black sand, though hardly in sufficient quantities to warrant the fear that deep placer mining at San Francisco will detract in any great measure from the ocean beach excitement. Some of the wells have been affected by the tides. Some wells close to each other have affected each other's supply. Others, grouped even more nearly together, have seemed to be entirely independent as to water resource. Brackish water has been found in some wells; in some very hard water; in others good soft water. These and other exceedingly interesting and instructive facts will appear as we study the wells. Figure 1 is a map of the principal part of San Francisco, showing the old land line, and in a general way the locations of about 70 wells. Choosing lines passing through or near the greatest number of widely separated wells, and forming as nearly as possible a rectangle, as shown on the map, we have drawn profiles of the city on these lines showing the depths of the wells. These profiles show a degree of conformity in the water strata to the surface, which would go to show a less broken condition of strata than is indicated by the outcroppings on the hills and by the well-borers' expression, that the "veins of water are like the veins in a man's arm;" however, when the imperfections of the data are seen, and other things are considered, it will appear that there is little to justify joining the bottoms of the wells, as has been done in the profile maps, Figs. 1 and 3. On the profiles the horizontal scale is to the vertical as 1-50 : ½. Hence the great distortion.

Now for the wells:

No. 1; 140 feet deep. No further data.

No. 2; 13-inch well; 194 feet; struck rock at 160 feet; got through it; quit without rock.

No. 3; 184 feet; sand down to 50 feet. Got no water until went 175 feet; got into sand and gravel, and then water came up to within 20 feet of the top.

No. 4; 89 feet. Filling, 40 feet; black mud, 10; sand and clay, 9; stiff yellow clay, 12; water, sand and gravel, 13; hard clay, 3; bed rock, 2.

No. 5; 201 feet. Blue clay, 40; then hard, black sand without water; at 108 feet struck black rock.

Less than a block from No. 5 is another well, the data of which are: 133 feet deep to the rock; yellow clay, 30 feet.

No. 6; 181½ feet; 40 feet of bay mud, 15 of black sand, then got into yellow clay and gravel, then hard dry sand without water, then into yellow clay and small rock, then on the rock at 181½ feet. We believe that this well did not get good artesian water, but after reaching the above depth was cemented up so as to supply surface water.

No. 7; 84 feet. Struck blue clay at that depth and quit. No water. A well 160 feet deep had been bored here before. The unnumbered well immediately north of No. 7 struck blue clay and no water at the same depth, 84 feet.

No. 8; 103 feet deep. No further data except that the well furnished a good supply of water. This well furnished black sand, at first thought to be gold-bearing, and some little placer mining was done at the dump. The most interesting fact connected with it is that while it struck water, well No. 37 not 300 feet away went down 212 feet in vain.

No. 9; 84 feet deep. Sand, 30; then clay, 10. The borer's comment is: "I will defy the world for better water."

No. 10; 168 feet. Clay, 40; hard sand, 30; then hard sand to the water. The unnumbered well across the street is only 116 feet deep, flowing. At 100 feet struck white, hard sand.

No. 11. This well, between No. 10 and No. 12, went 174 feet. Sand and clay, 90; then water all the way down; at 111 feet struck a flow that came 8 feet over the surface.

No. 12. Two wells at about equal distances west and east respectively of this number give the following data: West, 201 feet to the rock, quicksand down to 90 feet; blue clay from that down flowing well; water raised 6 feet above the surface. Across the street from this another well gave the same data. On the same block east there were two more flowing well.

No. 13; 84 feet deep; sand, 30; from that down flowing; east, 110 feet deep; 30 feet of sand to the water. This well yielded to the pump 75,000 gallons per day. When this amount was pumped out a well about one block to the east ceased flowing except at night, when the pumping at the former was stopped.

No. 14; 74 feet; blue mud, 40; flowing well. A short distance east of No. 14 a well flowing 8 feet over the surface gave the following data: Depth, 140 feet; filling, 10; blue mud, 40.

No. 15; 75 feet; blue mud, 75; flowed when bored. Another well on the same block went 140 feet, the first 40 being blue mud.

No. 16; 112 feet; good water.

The unnumbered well beyond the old land line, on Third street, was bored originally 175 feet. Water then raised to the surface, but only 600 gallons per day. This supply being insufficient, a diamond drill was put on and the well bored to a depth of 675 feet, but no more water was obtained. At well No. 39, about the same thing was done. The circumstances were, we believe, something as follows: Water was obtained at the ordinary depth for this neighborhood, when an injudicious use of giant powder injured the well and necessitated the use of the diamond drill. The well went to a depth of 560 feet, and, we think, found water.

No. 17; 140 feet; sand, 50 feet; at 130 feet struck a bed of acorns and leaves.

No. 18; 142 feet; blue clay, 40 feet; flowing well.

No. 19; 130 feet; quicksand, 40; blue clay, 35; water from that down; flowing well. About half a block northeast of this another well gives: depth, 180 feet; quicksand, 20; blue clay, 20; rock at 150 feet. A block southwest of No. 19 is another well, No. 41, 120 feet deep, with water within 8 feet of the surface. Well No. 50, in the same neighborhood, is 124 feet deep.

No. 21; 78 feet deep; flowing when bored. A curious fact is noticeable here. Well No. 22 is only one block from 21, yet its data, which are most complete, give no account of water above a depth of 132 feet.

No. 22; bore, 8 inches; depth, 144 feet. This well supplies quite a number of dwellings with clear, sweet, cold water. Sand, 28; blue clay, 8; cement and clay mixed, 6; light gray sand, 4; streaks of sand and clay, 7; solid blue clay, 4; fine yellow sand, 5; thin layers of clay, sand and cement, alternating, 18; yellow sand, 8; gray hard pan, 7; marl, black and yellow sand, mixed, 16; black clay, 3; black sand containing gold, 3; blue clay, 1; soft sandstone and yellow gravel, 4; washed gravel and gray sand, with fine stream of water, 12. The difference of level between the surface at 21 and at 22 is only 5 feet, 21 being the higher. This would indicate defects in the notes, great tilting of strata or else furnishes foundation for the underground river theory.

No. 23; 140 feet; quicksand, 60 feet.

No. 24; bore, 7 inches; depth, 144 feet. The water is pure, cold and sweet, rises within three feet of the surface, and cannot be lowered by pumping. It supplies fifteen families and a Chinese washhouse, besides water for sprinkling in front of the premises. Sand, 24 feet; yellow clay, 16 feet; soft sandstone, 6 feet; gravel and sand, 18 feet.

This neighborhood is peculiarly interesting. Less than 200 feet northeast of No. 24, is a flowing well, 150 feet deep. About thirty feet east of this last named is another, 240 feet deep, which gives 80,000 gallons per day, supplying a tannery. About 30 feet east again of this one, is still another, giving it is said about the same supply, but only 160 feet deep. Southwest of this about 100 feet, is yet another, 150 feet deep, the water rising to the surface and refusing to be lowered. About 250 feet north of Eleventh street, on Folsom, is another, 155 feet deep. None of these wells affect the others. At Ninth and Folsom, about two blocks north of the last named well, is a well 176 feet deep. In boring this the following were passed: sand, 49 feet; clay, 40 feet; quicksand, 20 feet; clay and cement in streaks; at 160 feet, sandstone, gravel, and black sand were passed into; at the bottom, gold-bearing quartz was found, assaying we believe $200 to the ton.

In our next we will continue this catalogue of wells, give some more profiles, and some general conclusions from the study of the wells.

UNION FOUNDRY, SACRAMENTO.—Business is steady at these works. We observe some large castings for house fronts coming out in the foundry. They have a large variety of choice patterns for this class of work, as well as for improved machinery for mining and other mill work. Among the orders in the hands of the proprietors, Robert Vielson & Co., is a large flouring mill complete—to be erected in the town of Williams, in the flourishing county of Colusa. Among their future stock work will be a number of Miller's hay presses, a California invention. We found our friend Charles H. Moulthrop, engaged at the Union in making a complete, and evidently very fine set of working drawings of Doane's steam wagon, another California invention, of great promise, concerning which we shall soon have more to say. Among other new things found here are castings for a new system of propelling steamboats, in which a direct acting steam piston is forced against the water in an open cylinder. By special reason of some superiority in casting white metal, this foundry is making the grinding plates for feed mills for agricultural stores all over the State.

OUR AGENT IN OREGON AND WASHINGTON TERRITORY.—Mr. L. P. McCarty, an experienced canvasser and trustworthy gentleman, will visit Oregon and Washington Territory during the coming weeks as agent for our publications. We bespeak him a kind reception from our friends at the north.

Mining and Scientific Press Patent Agency.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the largest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

The Mining & Scientific Press

is the leading mining journal in America, and it enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast it is decidedly popular, and is a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

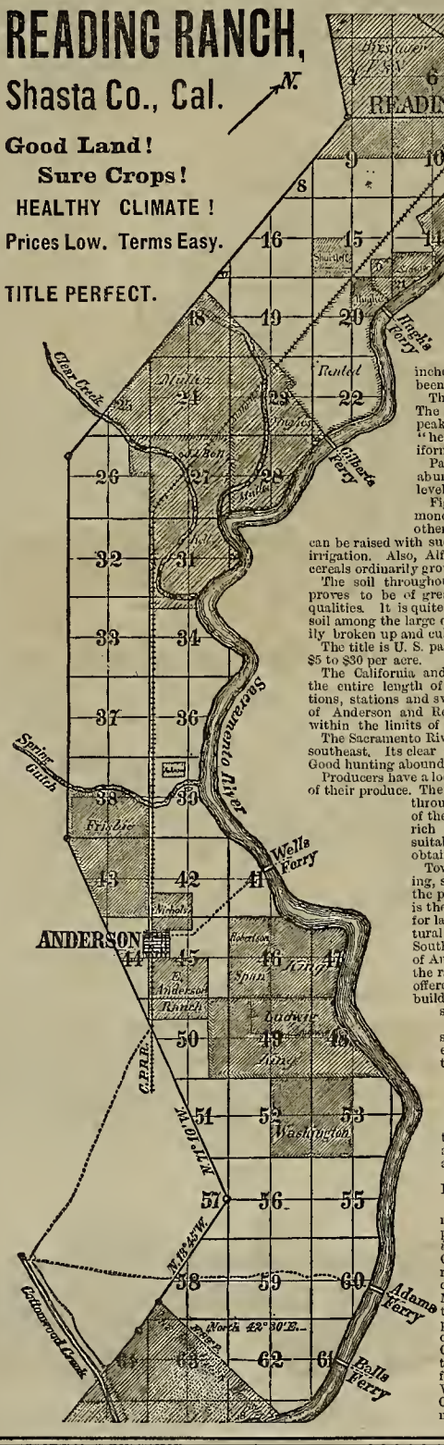
Photo Relief and Wood Engraving

At the MINING AND SCIENTIFIC PRESS office, No. 202 Sansome Street, N. E. corner of Pine, San Francisco. We do designing and Fine Wood Engraving in the highest style of the art. Our new Process of Photo-Relief Engraving enables us to produce some classes of work with more accuracy and perfectness than is ordinarily attainable by old methods, and at prices hitherto impossible. Call and see our specimens, or send a stamp for Circular of Illustrations.

READING RANCH,
Shasta Co., Cal.

Good Land!
Sure Crops!
HEALTHY CLIMATE!
Prices Low. Terms Easy.
TITLE PERFECT.



The Reading Ranch, in the Upper Sacramento valley, originally embracing over 26,000 acres of choice grain, orchard and pasture land, is now offered for sale at low prices and on favorable terms of payment, in subdivisions to suit purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is healthy and desirable. The near proximity of high mountain peaks give cool nights during the "heated term" which occurs in our California summers.

Pasturage, wood and good water are abundant. The tillage land is mostly level, with complete drainage.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract without irrigation. Also, Alfalfa, Vegetables, Corn and all other cereals ordinarily grown in the State.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The title is U. S. patent. Prices range principally from $5 to $30 per acre.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading, all of which are located within the limits of the ranch.

The Sacramento River borders the whole tract on the southeast. Its clear waters are well stocked with fish. Good hunting abounds in the surrounding country.

Producers have a local market, which enhances the value of their produce. The railroad transportation route is level throughout to San Francisco. A portion of the land is auriferous and located near rich mines now being worked. Land suitable for settlers in colonies can be obtained on good terms.

Town lots are offered for sale in Reading, situated on the Sacramento river, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

P. S.—Send postage stamp for illustrated paper containing information about Shasta county and these lands, and say advertised in this paper.

Location of Shasta County.

Shasta County lies not far from midway between the two most important ports on the Pacific shore, *i. e.*, San Francisco and Portland, Oregon, and directly on the overland route, which in the future will become the grand thoroughfare from Mexico to British Columbia. The town of Reading, at present, and probably for years to come, the head of railroad transportation on the California side of the mountains intervening below Oregon, is distant from San Francisco by railroad (via Vallejo) 255 miles; from Sacramento City, 169 miles; from Marysville, 117 miles.

18 & 20 Fremont Street, San Francisco, Cal.

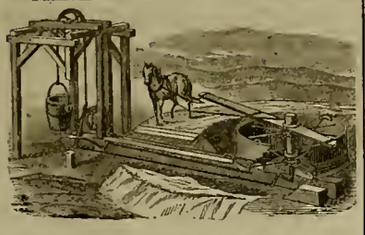
MINERS' HORSE-POWER.



This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO.,

THE O'HARRA CHLORIDIZING FURNACE.

This furnace is guaranteed to chloridize from 88 per cent. to 95 per cent. of the silver, and put gold in a state so that 88 to 95 per cent. of the battery assay can be obtained by amalgamation on any gold or silver ore ever formed by nature.

The cost of Roasting and Chloridizing is as follows:

One man, per day	$ 3 50
One man, per day	3 00
Wood, 1½ cords at $3	7 00
Cost of 20 tons	$13 50
Cost of one ton	67½

From 2½ to 5 per cent. of salt is necessary.

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

Several furnaces are in successful operation in California, Nevada and Idaho.

Any persons wishing any reference can address:

Judge Wm. Webster, Paymaster Mine, Reno, Nev.
Lewis Chalmers, Manager Exchequer and 1XL Mines, Silver Mountain, Cal.
J. S. Cone, Vice-President Tehama County Bank, Red Bluff, Cal.
R. H. Campbell, Superintendent Aftertbought Mine, Redding; Shasta County, Cal.

CHESTER STEEL CASTINGS CO.,
EVELINA STREET, - - - PHILADELPHIA, PA.

TO OWNERS OF REBELLIOUS ORES.

Persons interested in mines of rebelious ore, or having on hand any ore that is not satisfactorily worked, yielding less than it assays, will do well to notice the following offer. The undersigned is in possession of a new secret process which he is willing to try on any ores sent to him. If a pound or more of ore is forwarded to his address, he will test it with his process, and acquaint the owner with the results and the cost per ton for working. Address,

S. P. BRESSLER, Elkhardt, Indiana.

Continued from page 229.

templates putting up a mill very soon, as he can easily produce 50 tons of ore per day, and says there is too much gold and silver in sight to lay idle any longer. The Northern Light mine still continues to produce the same good quality of ore, and Mr. Whitney, the President of this company, has a fine pile of rich ore on the dump ready to be hauled to the mill as soon as the Extra company are ready to crush the ore. Superintendent Springer is running a very large and substantial tunnel in the Winthrop mine, and has everything in good shape for the rainy season, and, judging from the looks of his ore dump, the Winthrop Co. have ore enough out and neatly piled up to last a 10-stamp mill a long time, and enough more good ore in sight to last for many years. This mine is so situated that there can be three years' crushing done before there will be any necessity for hoisting machinery, as the main shaft is already connected with tunnels to a sufficient depth to produce many thousand tons of ore.

NEVADA.

ITEMS.—Tuscarora is steadily improving. The Golden Eagle mine in the Bull Run range has ore that gives average assays of $500 per ton. Water power and pine timber are close by in abundance. The Richmond furnaces will be speedily rebuilt and will be in much better shape for rapid work. The leaching process seems to have been a success in the neighborhood of Pioche. A Danville company have a 13-inch vein, some of the ore assaying as high as $1,300 per ton. Wide and well-defined ledges are an everyday thing in Tem Pahute district. There has been struck on the Lodi ledge, Lodi district, a well-defined four-foot vein of chlorides and carbonates. At 30 feet depth the ledge is seven feet wide, the ore assaying all the way from $40 to $100 per ton. The Eclipse ledge, the first and largest yet discovered in Shaw district, carries rich ore, and there are hundreds of tons of loose quartz, some of it rich in silver, along the course of the vein. Two samples of ore from the second and lower levels of the Alexander mine at Grantsville assayed respectively $130.35 and $274.87. A large body of rich ore has been struck in sinking on the Blue Jacket lead. It continues to increase in size and to hold its improved quality. A very rich strike has been made in the 320-foot level of the Jefferson mine, the ledge is three feet thick and carries fine ore.

WASHOE.

SUMMARY.—Gold Hill *News*, Oct. 9th: The prospects for opening up another of the richest and largest bonanzas of paying ore in the Sierra Nevada, have not been equaled by anything on this Comstock since the opening up of the 1500 level of the Consolidated Virginia mine in 1873. This incline in that mine is now down over 200 feet on the slope below where the ore was first struck, having reached the 2200 level yesterday afternoon. In excavating for the last set of timbers, ore assaying $300 per ton was encountered, proving conclusively that the ore is not only continuous, but still holds its richness to that depth.

The angle at which the west clay wall was pitching when last seen would, if continued to that depth, give a width of over 250 feet to the ore vein. It is the intention to open the station and continue the main incline downward without any stop whatever. While this is being done chutes will be put in and a drift started westward to crosscut the ledge, and at the same time another started to connect at the earliest day possible with the north winze now being sunk below the 1700 level. To open the station, put in the chutes and get ready to start these drifts, will take from two to three weeks.

The south end of this new and splendid ore deposit is being approached as rapidly as men, powder and machinery can accomplish the feat at three different points. The first of these is by the North Con. Virginia shaft, which is now down 1466 feet, and is going directly down on top of the ore. Another is the joint Union Con. and Mexican winze which is being sunk below the 1600 level of those mines, and the third point is the north lateral drift on the 2000 level of the Ophir, which is being pushed with all the speed possible to complete a connection with the North Con. Virginia shaft.

A large drift, 8x10 feet in size, is being run from the Hale & Norcross shaft, at the depth of 2000 feet, to connect with the Chollar combination shaft. The crosscutting operations in the Belcher, Crown Point, Alta and other mines, are progressing as usual without any new or valuable developments to report.

BULLION SHIPMENTS.—McCrackin, Oct. 1st, $7,251.91; California, Oct. 2d, $59,854.03—total to date, $290,937.24; Independence, Sept. 30th, $6,719.20; Bodie, Oct. 3d, $12,250.53; 8th, $16,000; Northern Belle, Oct. 2d, $3,949.20—total for Sept., $58,430.94; Oct. 5th, $4,128.88; Grand Prize, Oct. 2d, $2,824.26; Ontario, Sept. 27th, $3,992.10; 28th, $3,229.50; 30th, $3,350.27; Oct. 1st, $3,628.48; Oct. 2d, $3,298.58; Oct. 3d, $3,092.92; Germania, Oct. 3d, $2,800.00; Silver Reef, Oct. 2d, $13,329.26; Hillside, Oct. 8th, $6,000; Navajo, Oct. 7th, $7,700; Homestake, Sept. 28th, $13,500; Tiptop, Sept. 28th, $10,000; Raymond & Ely, Oct. 1st, $3,100; Northern Belle, Oct. 2d, $3,900; 5th, $4,128.88; Orieutal Con., Oct. 3d, $3,000; Star, Oct. 8th, $3,000; Tyho Con., Oct. 4th, $3,755.25; Mauhattan, Oct. 8th, $11,500; Hackberry, Oct. 8th, $6,132.33; Hillside, Oct. 9th, $5,500; Leopard, Oct. 8th, $4,700.

[Copyrighted.]

Mining Terms and Phrases.

The following comprises a list of the more common mining terms and expressions in general use on the Pacific coast, the greater portion of them being also employed in all English-speaking countries. Some, however, are of recent origin and confined in their application to the States and Territories of the extreme West. Of these latter a few are entirely new, having grown out of the exigencies of the occasion or been invented by a class of men who have shown themselves to be possessed of an imagination fertile in this field of invention. In some cases the words themselves are not new, but have simply been employed in a new sense or had an additional meaning added to them, a small number having been borrowed from the Spanish or other foreign tongue. For the most part, however, our mining vocabulary is made up of English words, having fixed and well-defined meanings and which have been legitimatized by long use:

ADIT.—An underground opening for enterlug a mine—a tunnel.

ALLUVIUM.—Soil formed by the action of water.

AMALGAM.—Quicksilver containing other metals, usually gold or silver, or both.

ARRASTRA.—From the Spanish *arrastrado*, dragged along. A machine consisting of a sweep revolved horizontally on a pivot, and to which heavy stones or other weights are attached and dragged along over a hard circular floor. Used for crushing and amalgamating ores.

BEDROCK.—The rock that forms the bed or bottom of any metalliferous deposit, commonly applied to the slate underlying auriferous gravel or that composes the banks of the buried rivers and other ancient channels.

BLIND LODE.—One that shows no croppings on the surface.

BONANZA.—A large and profitable ore body.

BOULDER.—A large, rounded mass of rock, worn smooth by the action of water.

BREASTING.—Taking ore from the face of a mine.

BULLION—Uncoined and unmanufactured gold or silver.

CAP-ROCK.—The formation overlaying the pay-dirt or ore, sometimes corrupted into *cab*.

CARBONIFEROUS.—Containing coal.

CRIPPA.—Spanish for a small piece or particle. A lump or mass of native gold, a "nugget."

CRUTH.—An incline from an upper tunnel or level to a lower one, through which to slide ore. Sometimes a chimney or column of ore is called an ore chute.

CONGLOMERATE.—Rocks composed of pebbles and gravel cemented together; pudding-stone.

CONTACT LODE.—One lying between two different kinds of rock, as, for example, porphyry and slate. Prof. J. S. Phillips, in his recent work on mineralogy and mines, very properly designates these as "intervening" lodes or veins.

CROPPINGS.—Ledge matter exposed on or above the surface; outcrop.

CROSSCUT.—A drift run at right angles with the ledge, for the purpose of prospecting it.

CUPRIFEROUS.—Containing copper.

DEBRIS—Fragments of rock detached from the sides of a mountain and piled up below. Sediment from hydraulic or other mines.

DENUDATION.—Rocks laid bare by the action of running water, or other agency.

DEPOSIT.—That which is laid or thrown down.

DETRITUS.—A mass of substances worn from solid bodies by attrition and reduced to small particles.

DISINTEGRATED—Separated into integrant parts without chemical action.

DRIFT.—Earth, pebbles and boulders that have been drifted by water and deposited over a country while submerged.

DUMP.—The place where ore is put after being taken from a mine.

EROSION.—The act of eating or wearing away.

FACE.—The extreme end of a tunnel, drift or excavation, where work is proseouted.

FIND.—A valuable discovery of ore or metal.

FISSURE.—An opening or chasm running lengthwise; a formation.

FLOAT-ROCK.—Fragments of a lode that have been floated by the water or by other means carried down and left on the surface. Ledges are sometimes found by tracing up the "float."

FLUVIATILE.—Formed by or belonging to rivers.

FLUX.—Any substance employed to promote the fusion of minerals or metals.

FOSSILS.—Petrified organic remains.

GANGUE.—The rock or mineral that contains the ores of metals. Quartz is commonly the gangue rock of gold and silver ores: matrix.

HORSE.—A mass of wall rock or other barren matter obtruded into an ore-bearing lode or fissure.

INCLINATION.—Leaning; deviation from an upright position. An *incline*, a slanting shaft or tunnel.

INTERSTRATIFIED.—Stratified between other bodies.

IRON PYRITES.—A hard, brittle mineral, of a yellowish brilliant color, found in various ores.

JUMP.—To jump a mining claim is to take illegal possession thereof by force or otherwise.

LACUSTINE.—Pertaining to lakes or swamps.

LAMINA.—(*pl.* lamine). A thin scale, layer or coat.

LAVA.—Melted rocks and minerals ejected from volcanoes.

LIMESTONE.—Rock from which lime is made through the expulsion of its carbonic acid or fixed air by burning; carbonate of lime.

LOCATE.—The process whereby a possessory right is established to a mining claim is called locating the same, the property so secured being designated a claim or location. This method of procedure is under the Spanish law called *denouncing* a mine.

LODE.—A longitudinal fissure or chasm filled with ore-bearing matter and having well-defined side walls. In our mining parlance, lode, lead, vein and ledge are synonymous terms. A blind lode is one that shows no croppings.

MICA.—A shining mineral of various colors and capable of being split into thin parts: By the ignorant sometimes mistaken for gold.

OPAQUE.—Not transparent.

OXID.—A combination of oxygen with another body; rust.

PETERING.—The pinching or giving out of an ore body.

PIPING.—Washing gravel in a hydraulic claim by discharging water upon it through a nozzle.

PLACER.—Earth containing deposits of gold dust.

PLATEAU.—A plain or flat surface.

PORPHYRY.—A barren, unstratified, reddish, purple or greenish rock, in which are imbedded crystals.

PRIMARY OR PRIMITIVE ROCKS.—Consist of the various kinds of slate, quartz, serpentine, granite and gneiss. They are the lowest group of rocks, are irregularly crystallized and contain few animal relics.

PROSPECT.—Searching for metalliferous deposits or examining the same when found, also the percentage of metal such deposits are found to contain on being so examined.

PYRITES.—A combination of sulphur with iron, copper or other metal; a sulphuret.

QUARTZ.—A silicious rock occurring in glassy crystals and forming a part of nearly all rocks; pure flint. Quartzite containing no valuable mineral is by the miners called "bastard quartz."

RANGE.—A long line of mountains.

REDUCED.—Separated from foreign substances. The reduction of ores consists in extracting from them the metals they contain.

REGULUS.—The impure metal. Melted ore containing all its metallic ingredients.

"SALTING" A MINE.—The act of introducing rich ores into a mine or gold dust into a claim for deceptive purposes.

SCHIST.—Clay slate.

SECONDARY ROCKS.—Those above the primary and below the tertiary; made up chiefly of sand, clay and pebbles cemented together and contain many organic remains. They consist principally of chalk, green sand, clay, limestone, marl, sandstone, etc.

SECTILE.—Being cut with a knife the particles do not fly off but remain. A mineral midway between the brittle and malleable.

SERPENTINE.—A mineral found in primary limestone, gneiss and mica slate. It yields to the knife, is susceptible of a high polish and soapy to the touch; colors: green, yellow, brown and gray.

SHAFT.—A pit or long, narrow opening, vertical or inclined, for entering a mine.

SHALE.—A fine grained, slaty rock.

SLAG.—Scum, dross, the excrement of a metal; vitrified cinders.

SPAR.—A crystallized, earthy mineral, vitreous or splendent; brittle, with white streak and of many colors.

STAMPEDE.—A sudden rush of miners to some locality where an important mineral discovery has been reported.

STOPING.—Breaking down ore from the roof of a tunnel or ore chamber. Ore stopes are the same as ore breasts, except that the former means the ore overhead, the latter in front or on the sides.

STRATUM.—A flat bed or layer of rock, earth, mineral, etc.; *pl*, strata, seldom stratums; stratified, arranged in layers.

STREAK.—The color a mineral presents when scratched.

STRIKE.—A valuable mineral development made in a sudden or unexpected manner; a find.

STRIATED.—Marked with parallel scratches or lines.

SUPERIMPOSED.—Lying or imposed upon something else.

SULPHITE.—A salt formed by a combination of sulphurous acid with a base.

SULPHURET.—Combination of sulphur with a metallic, earthy or alkaline base.

SUMP.—A pit sunk in the bottom of a mine to collect the water.

SUPERFICIAL DEPOSITS—Are composed of such metals and ores as lie on or near the surface, intermixed with soil, sand, gravel, etc. They are also called washings or stream works, these metals and ores being gathered by washing with water. Much gold, all platina and some tin and cinnabar are collected in this manner.

TAILINGS.—The auriferous earth that has once been washed and deprived of the greater portion of the gold it contained. This term is also applied to the sulphurets and slimes that escape from the ore mills.

TALCOSE SLATE.—A primary rock, soapy to the touch.

TRAMWAY.—A track laid down for the passage of cars from a mine.

TERTIARY ROCKS.—Those lying above the secondary and below drift, consisting of sandstones, clay beds, limestones, green sand, gypsum, rock salt, lignite, etc., with animal relics.

UP-RAISE.—Excavating in a mine upwards.

UP-CAST.—A shaft is "up-cast" when the current of air is upward, out of it, and "down-cast" when it moves in an opposite direction.

WALLS.—The rocky sides of a fissure. When the fissure has an inclination the lower or under side is called the "foot-wall" and the upper the "hanging-wall."

WHIM.—A machine, usually operated by a horse, for raising dirt, ore or water from a shaft.

WINZE.—A shaft connecting one drift or level with another, but not reaching to the surface.

ZINC-BLEND.—A sulphuret of zinc that, from its resemblance to galena, is sometimes called "mock-lead," also "black-jack." It generally contains more than half its weight of zinc, about one-fourth sulphur and some iron.

Of the invented words to which allusion has been made, though often outrageous and without any etymology, some really seem marked by such significance and force as constitute them a sort of natural language. A "petering" ledge, a "nugget" of gold and a "booming market" are each rudely suggestive of the idea we wish to express. There is also in the phraseology of the terms and expressions derived from the Spanish an innate fitness as well as a comprehensiveness that renders their employment very convenient. We have in the English no word that so aptly expresses the sudden and impulsive movement of a multitude of people from one place to another as the term "stampeds," from the Spanish *estampar*, to run away, or, as we say, "make tracks." So, too, we have no one word that suffices to convey the idea of a mine containing an extensive body of good ore like the Spanish term "bonanza." To the stranger many of these expressions doubtless sound odd and even slangy, yet not readily would any modern mining community consent to expurgate them from their nomenclature.

In the progress of our mining industries new branches of the business have been developed and many original inventions and methods of operating introduced, each of which has led to the coinage of various novel terms or compelled us to resort to the use of old words for giving expression to new ideas. In supplying the want that has thus grown up, it would not be strange if some queer and odd-sounding terms should have gained standing in our mining glossary. An acquaintance, however, with the derivation of these terms will tend to show that their use is not in all instances wholly inappropriate. To call a rack for gravel screening a "grizzley" seems not so absurd to one cognizant of the dextrous manner in which the grizzly bear casts aside the rocks hurled at him as it would to one unacquainted with that fact, and so of many similar examples that might be cited.

Sometimes, through lack of agreement on a single word or failure to find one that just meets the requirements of the case, no one term has been united upon to express the new idea calling for embodiment in speech. Thus, the terms debris, tailings, detritus, slums, etc., are all in use for designating the outflow from our hydraulic mines, there being in the language no one word that fully represents their character. In the suit lately on trial between the farmers and the miners, the above terms were used indiscriminately, the unmeaning and outlandish word "slickens," whereby some Western attorney had in the earlier stages of this suit sought to characterize this stuff, having not once been used in the progress of this trial.

In regard to the terms "Bull," "Bear," "long and short," "pool" and "deal," "put and call," and all the other slang pertaining to the Stock Exchange Board, it may be observed that the less the practical miner knows about these the better he is off.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

STEAM PUMP.—George E. Dow, San Francisco. This invention relates to certain improvements in direct acting steam engines (for steam pumps), and it consists in the employment of a mechanism by which the main steam valves which operate the main piston may be moved with a degree of positiveness corresponding with any desired increase in the speed of the piston, so that a complete movement of the main valve and a full opening of the ports may be effected when the conditions require it most, that is, with high speed. It also consists in a means of operating, by which the change of stroke is accomplished without check, whatever may be the speed or pressure; and finally, in a reduction of the waste room between the valve and piston, so that the ports shall be short and direct, and no small ports communicate with the steam chest in such a manner as to form pockets that will become foul from precipitation of impure lubricants. Mr. Dow is foreman of the Hope Iron Works in this city. We shall shortly illustrate this steam pump, and describe it more in detail.

WAGON JACK.—James B. Newlaud, Sacramento, Cal. It consists of two horizontal frames connected by a link at each corner so that the two frames will have a parallel motion. The upper frame is raised and lowered by means of a lever and connecting bars. The lower or base frame is large enough to have a firm, solid bearing on the ground. The lever has its lower end secured between bounds at one end of the lower frame, and the connecting rods are attached to it near its middle, while their opposite ends are attached to the upper frame near its middle, so that by drawing the upper end of the lever forward and forcing it down to a horizontal position the frame is raised with a parallel motion. In use the closed frame is placed under the axle of the wagon or carriage and the upper frame is raised by means of the lever so as to lift the carriage or wagon wheels clear of the ground, a single operation serving to lift the entire end of the wagon or carriage and frame both wheels.

THE newsboys and bootblacks of Cincinnati gave their earnings for one day to the yellow fever sufferers.

IT has been decided that the Utah and Oregon railroad may legally pass though the Bannack Indian Reservation.

A COMMISSIONER is to be sent from San Francisco to New York to study means adopted there to prevent election frauds.

SMITH, Fleming & Co., East India merchants, Leadenhall street, E. C., London, have failed. Liabilities, several millions of dollars.

THE Imperial Bank of Russia announces, that it holds 147,784,805 roubles in coin, against notes issued to the amount of 723,810,155.

RECEIPTS of bank notes at the Treasury Oct. 3d, for redemption were only $100,000, the smallest amount ever received in one day.

ONE man in Riverside, San Bernardino county has no less than 20,000 orange trees planted on sometbing over 300 acres of land.

THE Winnemucca *Silver State* says: The Humboldt river is lower than at any time since the whites settled in this part of the country.

OUT of the 313,977 acres of assessed land in San Benito county, nine individuals or firms own 181,103 acres of it, or considerably over half.

THE amount of money that France is pledged to expend to relieve her railroads and to build other public works will reach $1,000,000,000 in 10 years.

RUMORED understanding between Russia and Roumania giving former right of passage through the Dobrudja in case of future wars with Turkey.

DURING the past season much work has been done on the Oregon and California railroad, preparing it for the heavy fall shipments of grain to Portland.

NEW YORK City wants an International Exhibition in the year 1889, to commemorate the centennial of General Washington's inauguration to the Presidency.

THE New York elevated railway has been presented by the Grand Jury as a nuisance. The reasons are the dropping of oil and cinders, escape of noxious gases, and the intolerable noise.

LONDON *Times* says of the Bank of Glasgow failure: The opinion expressed by bank managers is that a more reckless course of gambling with other people's money has never been pursued by any body of managers or directors.

OF 8,291 volumes circulated last month by a San Francisco library, 6,631 are classed as romances, 243 as history, 222 as magazines, 200 as poetry and the drama, 244 as biography, 259 as travels, 238 as science and art, 20 as theology, and 234 as belles lettres.

JOHN SPANGLER of Marysville, Cal., wisbes to learn the present residence of his sister, Mrs. Andy Dodge. When last heard from in 1858 she was living at Shaw's Flat, Tuolumne county, Cal. Any information leading to her discovery will be thankfully received by him.

THOUSANDS of acres of the most fertile lands along the banks of Skipanon creek, Clatsop county, Oregon, are about to be reclaimed from the tides by means of diking. Several hundred acres have already been so reclaimed, and the land is making excellent pasturage.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

FOR THE WEEK ENDING SEPTEMBER 24TH, 1878.

STEAM OR HYDRAULIC STEERING APPARATUS—John Gates, Portland, Ogn.

OIL CUPS—Alden D. Kilborn, Oakland, Cal.

OIL STOVES—Henry L. Howse, S. F.

CONVERTING MOTION—William Meyers, Oaklnnd, Cal.

Mining and Other Companies.

Keystone Quartz Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Sierra county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the thirtieth day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
Carolan, James, Trustee.....	50	200	100 00
Hall & Charles, Trustees.....	68	1248	624 00

And in accordance with law, and an order of the Board of Directors, made on the thirtieth day of August, 1878, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 201 Sansome street, corner of Pine, San Francisco, California, on the twenty-eighth day of October, 1878, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

LOUIS VESARIA, Sec'y.

Office, No. 201 Sansome street, corner of Pine, San Francisco, California.

New Basel Gold Mining Company.—Principal place of business, 610 Merchant street, San Francisco. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1878, an assessment of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary of the Company.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 18th day of November, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. F. LEGAYE, Sec'y.

Office 610 Merchant street, San Francisco, Cal.

Orion Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Iowa Hill, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the fifth day of September, 1878, an assessment (No. 3) of seventy-five (75) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, 28 Sansome Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fifth day of November, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 20th day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

P. CONKLIN, Sec'y.

Office, No. 28 Sansome Street (up stairs), San Francisco, Cal.

Pocahontas Mining Company.—Location of principal place of business, 411½ California street, San Francisco, California. Location of Works, El Dorado County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 14) levied on the 14th day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law and an order of the Board of Directors made on the 14th day of August, 1878, so many shares as may be necessary of each parcel of such stock will be sold at public auction at the office of the Company, Room 9, 411½ California street, San Francisco, Cal., on Wednesday, the twenty-third day of October, 1878, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

M. C. SOUTHARD, Sec'y.

Office, Room 9, No. 411½ California street, San Francisco, California.

Summit Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of September, A. D., 1878, an assessment (No. 5) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of said Company, 318 Pine street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of October, A. D., 1878, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the nineteenth day of November, A. D., 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W CLARK, Sec'y.

Office, Room 6, No. 318 Pine Street San Francisco, Cal.

The California Fruit Growing Association.—Location of principal place of business, San Francisco, California. Location of property, El Dorado County, California.

Notice is hereby given, that at a meeting of the Directors held on the first day of August, 1878, an assessment (No. 9) of three ($3) dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 641 Sacramento street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1878, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 21st day of October, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the California Fruit Growing Association, held September 23d, 1878, it was resolved that the day of above assessment becoming delinquent be postponed till Saturday, the 26th day of October, 1878, and the day of sale of delinquent stock is hereby postponed to Friday, the 22d day of November, 1878. D. A. BROWN, Sec'y.

Office, No. 641 Sacramento street, San Francisco.

Vigorit Powder Company.—Location of principal place of business, City and County of San Francisco, California. Location of works, California City, Marin County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 1) levied on the first day of August, 1878, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. Shares	Amount
Louis McLane, Trustee....	30	437½	$218 75

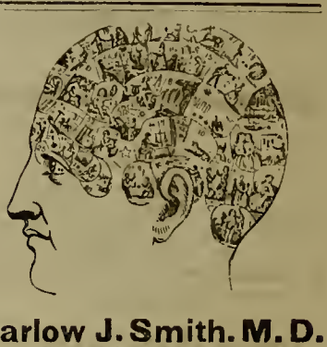
And in accordance with law, and an order of the Board of Directors, made on the First day of August, 1878, so many shares of each parcel of stock as may be necessary will be sold at public auction, at the office of the Company, Room No. 1, 109 California street, on Wednesday, the second day of October, 1878, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale. JAS. W. BAKER, Sec'y.

Office, No. 109 California street, Room 1, San Francisco, California.

POSTPONEMENT.—By an order of the Board of Directors made on the First day of October, 1878, the above sale is postponed until Monday, October 21st, 1878, at the same hour and place. JAS. W BAKER, Sec'y.



Barlow J. Smith. M. D.
Consulting Physician,
Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The Institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 20 years, and during the last 20 years has been constantly using the science connected with Physiognomy in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebræ, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

CERTIFICATE OF PATNERSHIP.

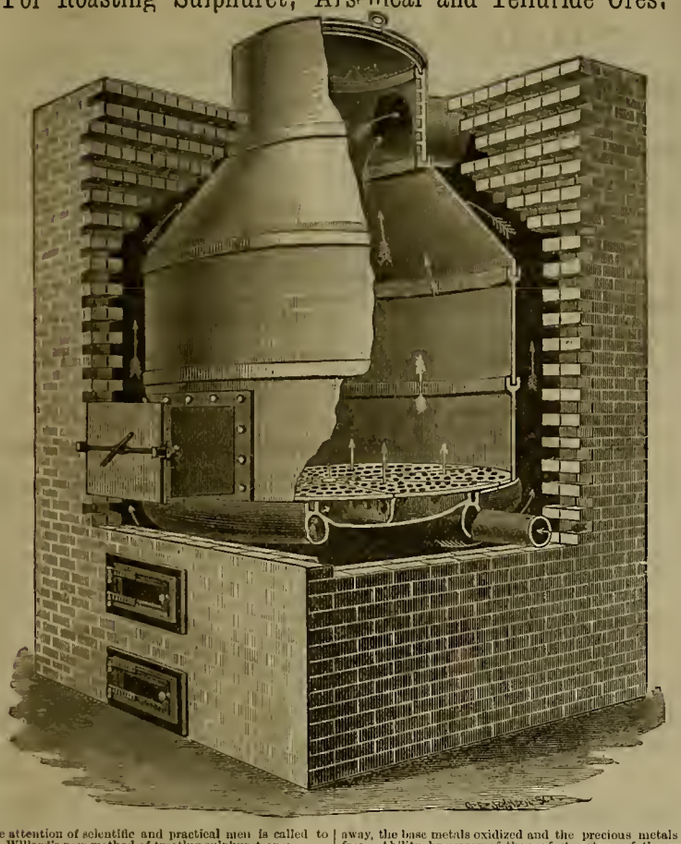
Z. A. WILLARD'S AUTOMATIC FURNACE

For Roasting Sulphuret, Arsenical and Telluride Ores.



The attention of scientific and practical men is called to Z. A. Willard's new method of treating sulphuret ores.

This process has been tried and tested on a large scale in Boston and in Colorado on every variety of ore, including sulphurets of iron, copper, lead and antimony, and arsenical and telluride ores of high and low grade, and in all cases with the most complete success.

The advantages claimed for the Furnace are: Perfect adaptation to the process. Simplicity and ease of construction. Cheapness—caused by shortness of time required in roasting, small amount of fuel needed, dispensing with skilled labor, and by the low cost and durability of the furnaces. Durability—the low heat used not injuring either iron or brick work. Economy of fuel—the amount used not exceeding one cord of wood to ten tons of ore. Economy of labor—no skilled labor, and very little labor of any kind, its automatic action only requiring one man to six furnaces. Perfect nature of roast—by which all the sulphur is burned away, the base metals oxidized and the precious metals set free. Ability, by reason of the perfect nature of the roast, to use chlorination (Plattner's method) for saving the gold in strictly gold ores. No loss by dust or volatilization.

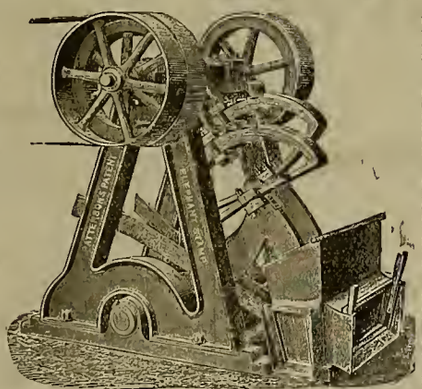
The cheapness and simplicity of this process renders it of vast importance in solving the question of the profitable reduction of low grade refractory ores.

Z. A. WILLARD, Patentee,

Baldwin's Hotel, Market St.,

SAN FRANCISCO.

Elephant Ore Stamp.



We beg to call your attention to this engraving representing the Elephant Ore Stamp. The advantages claimed for this Stamp are as follows:

CAPABILITIES.—The "Elephant" is capable of crushing as much stuff as a 12-Stamp Battery of the present system, having crushed as high as 11 tons of tough copper ore in one hour, through a No. 4 punched screen. The undersigned, however, will guarantee 20 tons per day of ordinary quartz through the same size screen.

WEAR.—The "Elephant" having only two parts, Shoe and Dies, the wear in this instance is equal to one-sixth of a 12-Stamp Battery. There being no Cam Tappets, Cam Shafts or Guides, the consequent wear on these parts is done away with; the leather thorough-brace, uniting the lever with the spring, would only require replacing at most, once a year.

POWER.—The "Elephant" only requires a seven horse-power engine to drive it, where a 12-Stamp Battery would require from 18 to 20 horse-power.

PORTABILITY.—The entire Battery, including Mortar, will weigh about six tons, thereby causing an immense saving in the way of freight to such places as Arizona, Mexico, Cariboo and Bodie. As no part of the machine weighs more than 1,800 lbs., the handling of the machine is comparatively easy, and in places where it would be necessary to pack the machine on mules, it could be easily made in pieces not to weigh over three hundred pounds.

The above engraving shows the Machine in exactly the position it would be placed in a mine; the reader will therefore see that all wood work is done away with, and that once the Machine is on the ground it will take but a few days to set it up and have it in full working order.

The "Elephant" can be seen working every day from 2 to 4 P. M. at No. 342 Main St, near Harrison, San Francisco

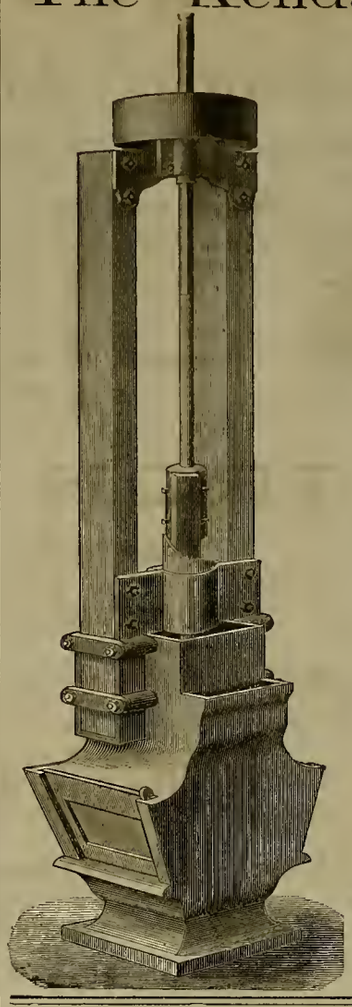
GOLD, SILVER AND COPPER MINING,
Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills.
Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

The Kendall Battery.



STEPHEN KENDALL, Patentee.

This Battery embraces the only genuine improvement that has ever been made in the process of reducing ores. The frame is all secured to the mortar, so that no extra framework is required. The stamp is rotated by a horizontal pulley on the top of the frame, and raised by the cam which is set horizontally on the girt timber. The upper end of the stem is made square, and works up through the pulley. When the stamp falls it crushes and grinds the ore fine by the continual rotary motion. The mortar has three discharge openings, and is adapted to either wet or dry crushing. A mill with an 800-pound stamp will crush five tons of average ore per day, shipping weight, 4,000 lbs., and requires about five horse-power. A 1,600 lb. stamp mill is in process of construction, which will give a capacity equal to any five-stamp mill. Several of them are now in successful operation in various parts of the country. For PROSPECTING PURPOSES this mill has no equal, as it can be set up and moved with such facility and operated at so small an expense. Address for further information,

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable as well as a valuable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

VOLUME XXXVII Number 16.

Artesian Wells—No. 2.

Underground San Francisco

Well No. 25, on the map published in the last issue, is 157 feet deep. In boring it, 50 feet of quicksand was passed through.

No. 26; 140 feet deep; quicksand, 40 feet.

No. 27; depth, 95 feet. This is a flowing well, and cannot be lowered by pumping, and is pure, cold, soft water. Sand, 29 feet; clay, 6 feet; black mud, 10 feet; yellow clay, 8 feet; quicksand, 15 feet; black clay, 4 feet; marl, 9 feet; broken sandstone, 8 feet; sand and gravel, 8 feet.

No. 28; depth, 130 feet. This is a flowing well, and cannot be lowered by steam pump, and yields pure, soft, cold water. Sand, 28 feet; blue clay, 12 feet; yellow clay, 15 feet; sand, 14 feet; blue clay, 8 feet; yellow sand, 15 feet; quicksand, 10 feet; soft sandstone, 12 feet; blue clay, 4 feet; washed gravel and sand, 6 feet.

No. 30; 160½ feet; sand, 60 feet; clay at the bottom. Across the street from this well another went 142 feet, passing 40 feet of black sand.

No. 31; 141½ feet; sand, 60 feet; all hard sand and water down.

No. 32; depth, 98 feet. Water rises to surface, and has been pumped at the rate of 88,000 gallons per day, lowering it 20 feet only when it comes to a stand, and can be lowered no farther. Strata passed: Sand, 31 feet; blue clay, 14 feet; quicksand, 12 feet; yellow clay, 5 feet; sand, 18 feet; hard pan and soft sandstone, 10 feet; sand and gravel, 8 feet. At this depth struck bedrock, after bringing up chips of redwood; the lower stratum of sand contained gold.

No. 33; depth, 125 feet. Pure cold water, sufficient for all purposes intended. Sand, 31 feet; blue clay, 7 feet; sand, 20 feet; yellow clay, 3 feet; quicksand, 25 feet; light blue clay, 12 feet; sand, 10 feet; flinty sandstone, 9 feet; sand and gravel, 8 feet.

No. 34; 116 feet deep; water at 90 feet; rock at the bottom. Between 34 and 20, there is said to be about 25 wells.

No. 35; 128 feet deep. Yields a large amount of water for laundry and dwellings. Strata: Sand, 35 feet; blue clay, 9 feet; hard pan, 8 feet; yellow sand, 15 feet; yellow clay, 10 feet; sand, 12 feet; blue clay, 4 feet; quicksand, 16 feet; soft sandstone, 12 feet; sand and gravel, 7 feet.

No. 36; 157 feet deep. Quicksand, 60 feet.

No. 37. This well has already been spoken of as obtaining no artesian water at a depth of 212 feet, though so near to good wells. Quicksand, 24 feet; then hard sand without water, 80 feet; then blue clay all the way down. At 180 feet struck a log, perhaps manzanita or sycamore.

No. 38; 121 feet to black rock; pure water.

No. 43. A well in this neighborhood struck water at 57 feet, but not sufficient supply; at about 80 feet, gold-bearing gravel was met with; at 93 feet vegetable matter was brought to the surface. Dr. Joseph Le Conte pronounces it coniferous wood, and *probably* the root of redwood. At 120 feet this well struck a supply of water.

These wells illustrate well the general theory of artesian wells. The water, falling upon the surface, flows along until it reaches pervious ground, when it sinks down, with greater or less rapidity according to the nature of the material, until it reaches some stratum through which it cannot pass. On this it accumulates, running always to the lowest points. The pervious material on the surface at San Francisco is generally sand, which has been blown in from the ocean, or has been used in filling. The impervious strata which collect the water are composed of clay, or rock; the deepest stratum on which lies the best water being overlaid with a gravelly, porous conglomerate. On examining the data of the above wells it will be found that sand is generally passed through first, then clay, then sand again succeeded by clay, then sand again with the water-bearing gravel. Above both the first and second clay water may be obtained, but being more or less contaminated with the surface drainage of the immediate vicinity, is passed through and neglected by those wishing good wells.

The average depth of the deeper wells is 150 feet, the shallower ones ranging from 70 to 100 feet, but whether in all cases the shallow and deep ones are fed from different sources it is not possible to decide from the data. At a depth of from 150 to 200 feet, and in some cases less, rock is struck, which has been bored into hundreds of feet without water being obtained, as for instance in wells 39 and 40 as mentioned in the last issue. It is said that this same rock has been bored into at Benicia, the Government well there being 1,500 feet deep, but at that depth no water is obtained. We know of no satisfactory account of the geological character of this rock. If this were determined it might be stated definitely whether or not it does outcrop far in the interior, and hence whether or not water may be expected below it flowing under us to the west far out to sea.

It is difficult to determine in exactly what manner the water occurs under us. The Geological Survey gives no account whatever of the position of the strata in the city further than that it is the most chaotic jumble to be found in the State. This is due, it is said very indefinitely, to the "influence of the east and west line of depression by which the 'Golden Gate' has been opened." However, the strata which have been covered up by the drift of sand, correspond to strata found on the east slope of the Santa Cruz mountains in Santa Clara valley. In this valley the east and west compression which forced up the mountains elevated the strata with considerable regularity, so that they dip gently to the east. If this had been the case in our vicinity, we should expect the strata in the region represented by our map to dip in the same general direction. But the "influence of that break" has interfered with this. Figs. 4 and 5 show a general inclination of the surface from northwest to southeast, and lines joining the bottoms of the wells correspond to this with some regularity. By comparing Figs. 1 and 3 with Fig. 4, it will be seen that a depression exists running from northwest to southeast, in which wells 36 (Fig. 1), 33, 28, 25 and 26 (Fig. 3), and 1, 35, 25, 28, 31 and 32 (Fig. 4) are bored. The other profile line from northwest to southeast (Fig. 5) may represent the general direction of a similar depression, on which

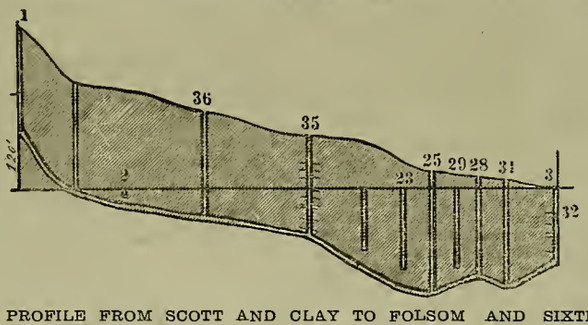

FIG. 4. PROFILE FROM SCOTT AND CLAY TO FOLSOM AND SIXTEENTH.

very many of the wells have been bored.

However, it is impossible to tell just how the water lies. The general impression is that it is to be found in the beds of old streams of the direction of which each well borer may have his own ideas. The finding of gravel in the successful wells and the existence of spots barren of water go to prove this. Wells 8 and 37 (Fig. 2), already mentioned, furnish an example. A well between 6 and 7, 260 feet deep, gives little water, while just across the street another well, only 82 feet deep, gives three times as much. In the neighborhood of wells 22 and 42, wells were run down about 80 feet, to the rock. They ran through clay and clean sand but gave nothing but salt water. Just across the street again, a well 120 feet deep furnished excellent water. Between 19 and 16 several attempts to obtain water were made before a good well was obtained. In the space of about a block four wells were bored. The first struck rock at 16 feet; the next at 30; another at 70, and still no supply of water; but after thus feeling around, a fourth, 75 feet deep, flowed over the surface. If there are channels underneath us in which the water runs, when and just how they were produced does not appear. They do not always correspond to present channels. The last named case is a proof of that, for the well that struck rock at 16 feet is very near the mouth of an old creek, as will be seen by referring to Fig. 2. Again, a well in the mouth of Islais creek, south of the city, proved a failure at about 140 feet. Wells very near the lagoon which puts up towards Tamalpais, back of Sausalito, in Marin county, where the formation is, we believe, the same as on our peninsula, also were failures. It would certainly be interesting to have some map of the country when the channels of these now underground streams were scoured out. In some views it looks more as though the successive layers of gravel, clay, sand, etc., had been pressed up into a series of waves and that the water seeks now the troughs of the waves.

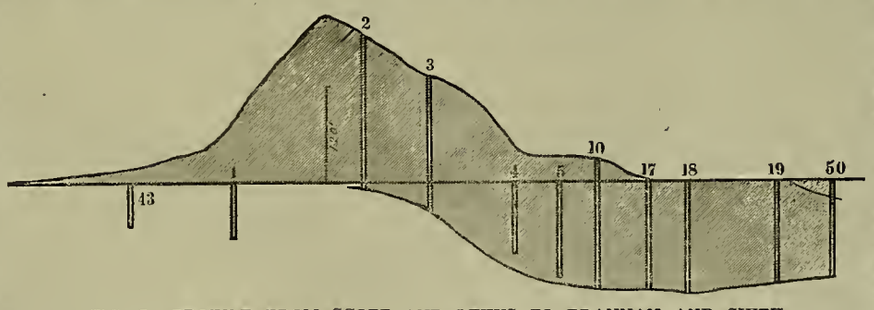

FIG. 5. PROFILE FROM SCOTT AND LEWIS TO BRANNAN AND SIXTH.

The interesting and unanswerable question now arises as to where the water comes from. Most of it, in the deeper strata at least, must be admitted at or near the outcrop. This outcrop may be around the bases of the hills and covered up in the large tracts of sand towards the beach. It has been estimated that 15,000,000 gallons of artesian water is pumped daily from San Francisco wells. That would make 5,475,000,000 gallons per year. If we consider the whole surface of the county as catching water for our wells (which is not the case) and take 23.3 inches as the average yearly rainfall, we would have a supply of 17,809,000,000 gallons per annum, or three times as much as is now used. But even considering that this much were furnished, it seems impossible that even the amount now obtained could be made available. For the artesian water is under pressure. Moreover, it has connection with the bay, as is proved by the effect which the tide has upon the level of the water in wells near the shore. This would indicate a constant flow into the bay. And it seems highly improbable that even the present supply could be sustained if the catchment surface is only our own neighborhood. It may be that not all the strata outcrop under the bay, in which case some of the supply might come from the other side. Ignorance of the relations of the strata on this side to those on the other prevents any attempt at judgment on this question. A well at Oakland point, 206 feet deep, is affected by the tide and from this it may be surmised that if strata extend unbroken from this side to the other they must dip very much to the east.

In the next we will continue this, giving, if possible, a figure explaining the effect of the tide on the artesian water, and perhaps further profiles. We invite discussion of the subject of artesian wells and desire all available information.

The South Pacific Coast Railroad.

We have watched with much interest the growth of this new and promising road, which we have already noticed at some length in the PRESS. Since that time the line has got into running order and now makes regular trips from San Francisco to Alma. The new ferry-boats, the *Newark* and the *Bay City*, are as fine as any on the bay, and make the trip across to the creek landing in less than half an hour. The wharves, slip and offices at the mouth of San Antonio creek are very nearly completed, and everything is in good working order.

From Mr. E. H. Mix, the engineer in charge of the mountain work, we learn the following particulars of the progress at this end of the line: In tunnels Nos. 3 and 4 a distance of 736 feet was made in the month of September. At the first of October the north end of tunnel No. 3 was in 1,426 feet, the south end 487 feet. The south end is now located in good solid ground, though the first hundred feet through the overlying strata was in very insecure and difficult ground. The east end of tunnel No. 4 is in 672 feet, the west end 574 feet. Tunnel No. 5 has been located and ground is broken at both ends. It will be 910 feet in length. The road is laid to the third crossing of Los Gatos creek, or two and a half miles above Alma, and is expected to reach the mouth of tunnel No. 3 in five or six weeks.

The mountains through which these tunnels are being built seems to be a sandstone, covered with overarching layers of schist. The whole of this sandstone is more or less thoroughly impregnated with hydrocarbons similar to petroleum. At various times "blowers" of gas have been struck which have given rise to slight explosions, but no accident has as yet resulted. This dissemination of hydrocarbons seems to be quite widespread throughout these hills, as we shall hereafter take occasion to notice.

The expectation is that the road will be in complete running order (as far as Santa Cruz) by the year 1880. And unless a great change in human nature occurs before that time, we venture to predict a heavy travel attracted that way by the beauty of the mountain scenery of this charming road.

THE Supreme Court of Nevada yesterday rendered their decision in favor of the Martin White mining company in the appeal case so long pending. The company's new mill is rapidly approaching completion, the contractors fully expecting to be on time with their contract.

THE Inyo *Independent* calls the Indian district, Mono, "a country for the next rush."

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Carson City, Nevada.—No. 1.

[From our Traveling Correspondent.]

This is, perhaps, the most beautiful and home-like town in the State of Nevada, and the next in size and population to Virginia City. It is situated in the upper portion of Eagle valley, and west from the Carson river about three miles. Carson City is the capital of the State of Nevada, also the county seat of Ormsby county. It contains a population of about 5,000. According to the Assessor's books, the real estate within the city limits is valued at $1,281,039. The city is well laid out. The streets are wide, level, clean and straight, and kept in good condition. The drainage is good. Shade trees and fruit trees and flowers abound. There are several excellent hotels, all kinds of mercantile houses in abundance, churches, school houses and theaters in numbers equal to the wants of a refined and intelligent population. Carson's railroad and stage connections make it an embarking point for a large portion of Nevada, as well as for many of the mining towns of Alpine and Mono counties, California. It is on the line of the Virginia and Truckee railroad, 30 miles from Reno, and 22 miles from Virginia City. Here is the terminus of the sleeping cars connected with the lightning express trains of this road. A daily stage leaves every afternoon for Genoa, south, and distant from Carson 14 miles, where connection is made with another line of stages for Monitor, Silver mountain, Markleville and other points in Alpine county, California. A six-horse coach leaves Carson every morning, upon the arrival of the passenger train from the West, for Aurora, via Genoa, distant 105 miles, and for Bodie about 12 miles farther. On the same road is a fast freight line called the Southern Transportation Company, which makes tri-weekly trips, carrying passengers and freight. During the traveling season, which embraces about eight months in the year, a daily six-horse coach is run to Glenbrook, on Lake Tahoe, the "Gem of the Sierras," distant 14 miles. This coach is driven by that celebrated old whip, Hank Monk, who has acquired such a world-wide fame by his drive with Horace Greeley from Carson to Placerville.

The Warm Springs.

These springs are about one mile and a half east of Carson. This property is now owned by Butts & George. The water is very hot, and rushes out in great volume from under or through a quarry of tertiary sandstone. The proprietors have enclosed with this sandstone five swimming baths, each 28 feet square, walls 15 feet high, lighted and ventilated in the roof. The water in the baths, is from four to eight feet deep, and so transparent that a pin can be seen upon the bottom, which, by the way is a smooth rock. The baths are drawn down every night, scrubbed out and filled with fresh water, as the immense volume from the spring is constantly passing through them. Upon analysis the water was found to contain sulphur, iron, soda and magnesia, and it is claimed that the water taken internally and externally possess remedial properties of great value. One thing I can attest, that it is a most grateful bath, and a great rejuvenator.

The State Prison.

This institution is situated at the Warm springs. The main prison building was built by Abraham Curry, in 1861, and occupied for a hotel, and was the place of meeting for the first Territorial Legislature. The buildings and walls around the prison yard are of sandstone, taken from the quarry upon which the prison is located. There are at present 140 convicts in the institution, of whom 65 are working in the shoe shop, 35 in the yard and quarry, the others being employed as laundrymen, cooks, carpenters, tailors, blacksmiths and waiters. The discipline of the institution is good, and its general management is very satisfactory. The officers at present in charge are General C. C. Batterman, Warden; Captain J. H. Mathewson, Deputy Warden; R. Gomoud, Captain of the Guard, D. H. Pine, Lieutenant of the Guard; J. J. Linn, Commissary; Harrison Gray, Bookkeeper.

The Mint

Is situated on Carson street, the main business street of the city, and within one block of the railroad depot. The building is a substantial stone structure, erected in 1869, at a cost, including the necessary machinery for the mint, of $240,000. The officers are: James Crawford, Superintendent; George W. Bryant, Melter and Refiner; Levi Dague, Coiner; W. P. Prescott, Assayer. There are employed, all told, 80 persons, of which 62 are males and 18 females. The coinage for the year ending June 30th, 1878, is as follows: Gold, 54,348 pieces, valued at $866,680; silver, 9,692,000 pieces, valued at $2,941,000. The deposits for the same year were in gold, $737,719.85, and in silver, $2,447,279.59.

The State Capitol.

This building was erected in 1870, and occupied by the Legislature in 1871. The material used in its construction is the sandstone from the Warm springs quarry, making a very substantial, solid-looking structure. It is situated in the center of a square, consisting of four blocks on Carson street, enclosed by a splendid iron fence with a stone base. The grounds are tastefully laid out and planted in shade trees. The building is in the form of a Maltese cross, with an entrance at each of the four ends. The executive departments are on the first floor, the legislative chambers, Supreme court rooms, and library are on the second floor. The State library—a special pet of Chief Justice Hawley—and the State mineralogical department, are features of the capitol that the State may well be proud of. The capitol building was erected at a cost of $175,000; cost of furniture, $25,000; cost of books and fixtures for State library, $40,000; cost of fencing and beautifying the grounds, $25,000. The capitol, with its tasteful and pleasant surroundings, is a just source of pride to the people of Carson and a credit to the State of Nevada.

The Orphans' Home,

Situated on the Warm springs road and within the corporate limits of the town, is a State charity and, as remarked to your correspondent by a citizen, the most noble and best conducted in the State. The building cost $12,000. There is 15 acres of land in the enclosure, which is chiefly devoted to raising vegetables for use of the inmates of the home. Orphans, as well as half-orphans, whose parents were residents of the State of Nevada, are entitled to its benefits. It is under the control of a State board consisting of the Surveyor-General, State Treasury, and Superintendent of Public Instruction, who have the entire direction or management of the home, including the appointment of those in immediate charge. The present parties in charge are Geo. B. Webb, Superintendent; Mrs. Geo. B. Webb, Matron; Miss Emma Verrill, Teacher. Number of wards at present in the institution, 65.

The Carson Opera House.

Among the improvements of recent date is the construction of an opera house, which is fully up to the requirements of a first-class theater. It has a seating capacity of 750, and is substantially and tastefully arranged. An elegantly upholstered dress-circle, comfortable orchestra seats, and a parquet are of the appointments. The house is well ventilated and so arranged that it can be emptied in an emergency in about three minutes. The stage is 34 by 48 feet, and provided with a complete set of stock scenes. The cost of this handsome theater is $15,000. W. G. A.

A MAMMOTH TREE.—Messrs. McKiernan, Manly & Hubbs, of Visalia, recently shipped from Tulare City a section of one of the largest, if not the largest, of all the big trees that have yet been discovered in California. The Stockton *Herald* says: The tree from which this section was taken was 111 feet in circumference at the butt, and stood 250 feet in hight, at which elevation it was broken off. At the breaking-off place it was twelve feet in diameter. These gentlemen have been at work getting this section ready for exhibition for nearly a year. The section is fourteen feet in hight and was cut from the body of a tree twelve feet from the ground, the base being so irregular in form, the irregularity extending up from the roots, that it was inexpedient to take the lowest part. At the distance of twelve feet from the ground the tree was twenty-six feet and six inches in diameter, this being the diameter of the base of the section exhibited. The top of the tree, or stub, as it really was, was felled twenty-six feet from the ground, the labor of felling it occupying four men nine days with axes. It made a noise when it came down that reverberated through the mountains like a peal of thunder. The work of taking out the section which is exhibited was then commenced from the top. The men dug the inside of the tree out with axes, these tools being the only ones that could be used to advantage. The wood was left six inches thick, exclusive of the bark, which ranges from three to ten inches in thickness. The diameter of the tree where it was felled (the diameter of the top of the section that is to be exhibited) is twenty-one feet. This shell was sawed down, making fifteen gigantic slabs. This tree stood six miles away from a public road, and a road was built this whole distance in order to get this section of the tree out. Each slab made a load for eight horses. The whole fifteen make two carloads. The owners of this great natural curiosity will exhibit it in this city, after which they will travel through the State, thence through the East and to Europe. This tree is claimed to be four feet larger in diameter than any other tree that has been discovered on the coast.

THE total number of shares changing hands in the New York mining exchange on Sept. 28th was 13,447, and the amount of money involved, provided there were no wash sales, was $5,226!

HARTLEY'S locations at Meadow Lake have been bonded to G. D. Roberts and A. E. Head, who are making quite extensive preparations for developing.

AT the Sulphur Bank Quicksilver mine there are six furnaces in working order. Four new ones are being constructed, and one is being repaired.

GOULD, the locator and namer of the famous Gould & Curry mine, is tending a little fruit store in Reno.

THE Idaho mine, Nevada county, pays its 10th dividend, $23,250.

An Opening for American Woolens in China.

The policy of our government in encouraging our consular representatives all over the world to report all opportunities for the introduction of American produce and manufactures is a wise one and may result in much advantage to our producers. It is not a new idea for consuls thus to keep their eyes open for trade. The representatives of other governments are thus alert and our own have already done good service in this direction. We trust their investigations and reports may continue. Many of them have plenty of time and the best possible opportunities for these investigations.

These remarks are called forth by a report by telegraph from Washington to the effect that the consul at Amoy, China, reports to the Department of State some important facts and suggestions relative to the trade in woolen goods. The States of the Pacific, especially California and Oregon, possess advantages for competing for the woolen trade of China which nothing can change or take away. Both San Francisco and Portland are nearer by some thousands of miles to all parts of China than any port of any other competing State in the world. California wool, and the coarser grades of Oregon, seem just adapted to Chinese uses. Some English writers have imputed the present demand for woolens in China to the enhanced cost of silk, and predict that a revival of the silk industry will cause a corresponding decline in the use of woolen goods. The consul shows that such a view is erroneous. Amoy is old, and the natural home of the silk worm and mulberry tree. Here Marco Polo discovered the beautiful cloth which he called "Zanitum"—satin. Observations from this point do not sustain the English theory. The demand for blankets, displacing dirty cotton coverlets, will certainly continue, and may be increased enormously. The use of all kinds of woolen goods must improve as their prices approximate those of cotton. Among other American articles made of wool, rugs, with pictures of tigers, dragons, etc., interwoven, are exceedingly popular.

This is exceedingly promising for our wool growing and manufacturing. The Chinese are fast learning the value of California flour and our mills are getting a profit on grinding and the "feed" in bran and middlings is left here for our dairymen and stock fatteners, and to enrich the manure which our soils need. This is much better than shipping wheat abroad, for it gives employment to our mills and millers and leaves a valuable constituent of the grain behind. It exports mainly the starch which we can best afford to part with. Not otherwise would he the building up a large trade in manufactured woolens instead of shipping the raw material eastward. It would invigorate our woolen mills and call into existence many new ones which are now being talked of. By all means let China call upon us for limitless quantities of woolen manufactures. We trust the consul at Amoy is correct in his forecast of the future.—*Pacific Rural Press.*

Cocoanut Oil Manufacture.

The Alameda Oil Manufacturing company is extensively engaged in the manufacture of oil from cocoanuts. It has a line of schooners running between this port and the South Sea Islands which bring at regular intervals cargoes of the cocoa. The fruit is gathered when ripe, by the natives, and the outer husk and shell being stripped off, and the meat broken into small fragments, it is packed in sacks and ready for shipment. Previous, however, to its packing, it is thoroughly dried in the sun, and thereby undergoes a process by which the fibrous matter is to a certain extent loosened, rendering the oily substance more easy for extraction.

The process of manufacture is similar to that used in the production of cotton seed oil. The cakes are first ground into a meal, then placed in sacks, about 10 inches wide by 24 inches long. These are placed in numerous compartments of a hydraulic press, and submitted to a pressure sufficient to extract the oil. The residue, in the form of cakes, is especially adapted to feeding stock, containing highly nutritive qualities. The oil is used at present for lubricating purposes, and also in the manufacture of soap; but there is no reason why it cannot eventually be refined to the extent of producing from it a palatable salad oil. This company is established at Alameda Point, and very little is known, generally, of the enterprise. The islands furnish this commodity to various countries of the world, Australia and California being the largest consumers, and an income of no inconsiderable amount thereby accrues annually to the natives. The Marshal and Gilbert groups furnish the largest amount.

ON the north side of the St. Gothard tunnel 1,000 men are employed underground, and 400 in the open air. Three hundred wagonloads of earth are excavated every day, and in the daily blastings 600 pounds of dynamite are used. The energy shown on the Italian side is said to be equally great.

NEWS is received of an important and rich mining development 10 miles west of Ellsworth, Nye county, Nevada. At 30 feet in depth the ledge is seven feet wide, carrying carbonates and chlorides assaying from $40 to $100. The find is owned by two poor prospectors named Holman and Duckett.

Mineralization of Gold.

Mr. Melville Attwood, whose paper on the "Milling of Auriferous Veinstones" was published in the PRESS of September 14th and 28th, read the following paper before the California State Geological Society on August 20th:
